Index—California and Western Medicine, Volume 44
January to June, 1936

INDEX ARRANGEMENT

Sequence of Subheads in Index

This index is arranged under the following headings:

- I. Authors.
- II. Subjects—Titles of papers.
- III. Editorials.
- IV. Editorial Comment articles.
- V. Bedside Medicine articles.
- VI. Medical History articles.
- VII. Miscellany columns.
- VIII. California Medical Association.
  - (a) General.
  - (b) Component County Societies.
  - (c) Department of Public Relations.
  - (d) Woman's Auxiliary.
- IX. Deceased Members.
- X. Nevada State Medical Association.
- XI. Book Reviews.
- XII. Report of Medical Examiners.

* * *

Key to Abbreviations in This Index

Or.—Original Article.
C. R.—Case Report.
B. M.—Bedside Medicine.
Ed.—Editorial.
E. C.—Editorial Comment.
C. N.—Clinical Notes.
L. M. H.—Lure of Medical History.

Index to Pages, Volume 44, California and Western Medicine, January to June, 1936

Date of Issue	No. of Pages	Date of Issue	No. of Pages
January, 1936	1-72	April, 1936	249-352
February, 1936	73-144	May, 1936	353-456
March, 1936	145-248	June, 1936	457-544

* * *

Two Volumes Yearly

California and Western Medicine is annually issued in two volumes: the first, from January to June, inclusive; and the second from July to December, inclusive.

* * *

American Medical Association Quarterly Cumulative Index

Members who wish to consult a general medical index are referred to the Quarterly Cumulative Index of the American Medical Association.

I
AUTHORS—INDEX

A — PAGE

- Alexander, A. A.—The Uremia of Circulatory Failure (Or.) 391
- Allen, Philip K.—Biochemistry as It Is of Importance in Dermatology—Proteins in Relation to the Skin (B. M.) 206
- Althausen, T. L.—Regulation of the Blood Sugar (E. C.) 359
- Anderson, Hamilton H., and Reed, Alfred C.—Tolerance to Cod-Liver Oil—U. S. P. X (E. C.) 462
- Arnold, Clement H.—Historical Gynecology (L. M. H.) 40

B

- Bacon, Samuel K., and Rusche, Carl F.—Urinary Extravasation Following Urethral Stricture (Or.) 284
- Bailey, Wilbur, and Taylor, Richard T.—The Importance of Lesions of the Intervertebral Discs in Relation to Trauma (Or.) 509
- Ball, Franklin I.—The Occlusive Dressing in the Treatment of Impetigo Contagiosa (C. N.) 402
- Barkan, Hans, Borley, W. E., Fine, Max, and Bettman, Jerome—Operative Results in Cataracts Coincident with Dinitrophenol Therapy (Or.) 360
- Barkan, Otto, Boyle, S. F., and Maisler, S.—On the Surgery of Glaucoma: Mode of Action of Cyclodialysis (Or.) 12
- Behneman, Harold M. F.—Quackery and Naturopathic Logic in 1795-1825 (L. M. H.) 104
- Beigelman, M. N.—Syphilis and Blindness (Or.) 497
- Bettman, Jerome, Barkan, Hans, Borley, W. E., and Fine, Max—Operative Results in Cataracts Coincident with Dinitrophenol Therapy (Or.) 360
- Bingham, E. M., and Cutler, O. I.—Chemical Peritonitis (C. R.) 45
- Black, Benjamin W.—Psychiatry and the Law (Or.) 87
- Bloomfield, Arthur L.—Peptic Ulcer: The Bearing of Its Symptoms on the Indications for Operation (Or.) 494
- Bogen, Emil—Tolerance to Alcohol: Its Mechanism and Significance (Or.) 262
- Bonta, Maurice B.—The Rôle of the General Practitioner in Present-Day Medicine (Or.) 477
- Borley, W. E., Fine, Max, Bettman, Jerome, and Barkan, Hans—Operative Results in Cataracts Coincident with Dinitrophenol Therapy (Or.) 360
- Boyle, S. F., Maisler, S., and Barkan, Otto—On the Surgery of Glaucoma: Mode of Action of Cyclodialysis (Or.) 12
- Burns, G. Creswell—Relapsing Fever in California (Or.) 29
- Butler, Edmund—The Traumatic State (Or.) 474

C

- Carey, T. Sheridan—The Cost of Industrial Medical Care (Or.) 481
- Carr, Jesse L.—Acute Fluorin Poisoning (Or.) 83
- Clarke, R. Manning—Cardiac Care After Decompensation (Or.) 153
- Cleary, E. W.:
  - Fracture of the Neck of the Femur: Significant Advances in Treatment (E. C.) 6
  - Fractures of Both Bones of the Arm or Leg—Their Management (Or.) 94
- Coffey, Walter B., and Humber, John D.—Cancer Studies: In Relation to Results of Treatment with an Aqueous Extract Made from the Cortex of the Suprarenal Gland (Or.) 160
- Crow, Lloyd B., and Gibson, Thomas E.—Hyperparathyroidism with Nephrolithiasis (E. C.) 463
- Cummings, J. Carl—Eclampsia (B. M.) 403
- Cutler, O. I., and Bingham, E. M.—Chemical Peritonitis (C. R.) 45
- Cutting, Windsor C.—Chylous Ascites in Lymphatic Leukemia (C. R.) 198

D — PAGE

- Delprat, G. D., and Weeks, Alanson—On Sugar and Fruit Juices Before Operation Under a Major Anesthetic (E. C.) 5
- Dennis, H. G., and Moore, C. Ulysses—Studies in Rickets (Or.) 288
- Dewey, Earle T., and Mensor, Merrill Coleman—Intracapsular Fractures: Neck of the Femur (Or.) 271
- Dorr, William R.—A Rural Cancer Clinic (Or.) 466

E

- Emge, L. A.—Dysmenorrhea (B. M.) 112
- Epstein, Norman N., Gay, LeRoy K., and Morrow, Howard—The Modern Therapy of Syphilis (Or.) 257
- Epstein, Norman N.:
  - Neurosyphilis: Its Treatment (Or.) 186
  - Artificial Fever as a Therapeutic Procedure (E. C.) 357
- E. T. W.—Joseph Pomeroy Widney, A.M., M.D., D.D., LL.D. (L. M. H.):
  - Part I 292
  - Part II 396

F

- Fine, Max, Bettman, Jerome, Barkan, Hans, and Borley, W. E.—Operative Results in Cataracts Coincident with Dinitrophenol Therapy (Or.) 360
- Fist, Harry S.—Breast Support (C. N.) 43
- Flothow, Paul G.—Injection of Sympathetic Nervous System (Or.) 182
- Frost, Kendal—Biochemistry as It Is of Importance in Dermatology—The Mineral Salts in Relation to the Skin (B. M.) 201

G

- Garth, W. L.—Spinal Anesthesia and the Anesthetist (Or.) 364
- Gay, LeRoy K., Morrow, Howard, and Epstein, Norman N.—The Modern Therapy of Syphilis (Or.) 257
- Geiger, J. C.—Poisoning Due to the Ingestion of a Mixture of Sodium Bicarbonate-Sodium Fluorid (Or.) 81
- Gibson, Thomas E., and Crow, Lloyd B.—Hyperparathyroidism with Nephrolithiasis (E. C.) 463
- Gillespie, C. G.—Twenty Years of Sanitary Engineering in California (L. M. H.) 296
- Ginsburg, H. M.—Fresno County Part-Pay Plan (Or.) 92
- Goeckerman, William H., and Wilhelm Louis F. X.—Lymphoblastoma (C. R.) 517
- Goldenberg, J. L., and Tiber, Leon J.—Placenta Praevia (Or.) 489

H

- Haldeman, Keene O.—Local Injection of Procain: In the Diagnosis and Treatment of Derangements of Certain Joints (E. C.) 256
- Hale, Nathan G.—Carcinoma of the Prostate (B. M.) 298
- Hayhurst, J. S.—Methemoglobinemia (C. R.) 401
- Hitchcock, Harold H., and Reynolds, T. Eric—Shock Treated by Warmed Air (Or.) 98
- Humber, John D., and Coffey, Walter B.—Cancer Studies: In Relation to Results of Treatment with an Aqueous Extract Made from the Cortex of the Suprarenal Gland (Or.) 160
- Hunter, P. M., and Kehr, E. F.—Acute Appendicitis Associated with Acute Mechel's Diverticulitis (C. R.) 199

J

- Johnson, Lucius W.—Medicine and Surgery in the Fleet (Or.) 279
- Johnston, W. H.—Agranulocytic Angina (Or.) 20
- Judd, E. Starr—The Surgical Treatment of Lesions of the Stomach and Duodenum (Or.) 8

K PAGE

Kehr, E. F., and Hunter, P. M.—Acute Appendicitis Associated with Acute Meckel's Diverticulitis (C. R.) 199
Kiger, William H.—Cancer of the Rectum (B. M.) 519
Kilgore, Alson R.—Cancer of the Breast (B. M.) 47
Krahulik, Emil J.—Eclampsia (B. M.) 405
Kulchar, George V.—Biochemistry as It Is of Importance in Dermatology—The Carbohydrate Metabolism in Relation to the Skin (B. M.) 202

L

Lamb, Edward J.—The Subthyroid Child (Or.) 371
Langley, Robert T.—Heart Disease in Physicians (Or.) 381
Larsen, Albert E.—Public Health Significance of the Dietary Habits of People on Relief (Or.) 491
Leake, Chauncey D.—Vitamin D Toxicity (E. C.) 149

M

Maisler, S., Barkan, Otto, and Boyle, S. F.—On the Surgery of Glaucoma: Mode of Action of Cyclodialysis (Or.) 12
Maner, George D.—Malignant Tumors of the Testis (Or.) 368
Manwaring, W. H.—Genes, Haptenes and Autocytotoxic Hormones (E. C.) 150
Martin, Harry W.—Injuries of the Posterior Urethra (Or.) 16
Maynard, Merlin T.-R. — Nevus Vaculosus Accompanied by Streptococcic Bacteremia (Or.) 479
McEvers, Albert E.—Sclerosing Lesions of the Stomach, Terminal Ileum and Colon (C. R.) 108
McGavack, Thomas H.—Dinitrophenol and Reducing (E. C.) 77
McNeile, Lyle G.—Dysmenorrhea (B. M.) 111
Mensor, Merrill Coleman, and Dewey, Earle T.—Intracapsular Fractures: Neck of the Femur (Or.) 271
Merrill, H. P.—Bilateral Salivary Calculi (C. R.) 110
Meyer, K. F.:
  The Therapeutic Use of Convalescent Serum in Poliomyelitis (E. C.) 254
  The Frequency of Botulism (Or.) 385
Michael, Paul—The Pathology of Sudden Operative Death (Or.) 179
Moore, C. Ulysses, and Dennis, H. G.—Studies in Rickets (Or.) 288
Morrison, Gordon M.—A Simple Splint for Forced Extension of the Elbow (C. N.) 110
Morrow, Howard, Epstein, Norman N., and Gay, LeRoy K.—The Modern Therapy of Syphilis (Or.) 257
Morton, Daniel G.—Eclampsia (B. M.) 404
Movitt, S. I.:
  Stone Formation in the Upper Urinary Tract (C.N.) 197
  Modern Tests of Kidney Function (E. C.) 255

N

Novy, Frederick G., Jr.—Biochemistry as It Is of Importance in Dermatology—Fats in Relation to the Skin (B. M.) 205

P

Peers, Robert A.:
  Address of the President: Sixty-fifth Annual Session of the California Medical Association (Or.) 464
  Salutation from President Peers (Or.) 249
Percy, James F.—Cancer of the Breast (B. M.) 49
Pettis, J. H., and Sorsky, E. D.—Thyroid Gland Ablation (Or.) 34
Pettit, Albert V.—Dysmenorrhea (B. M.) 111
Pflueger, Otto H., and Stowe, W. P.—Biopsy in Malignant Disease (Or.) 99
Player, Lionel P.—Carcinoma of the Prostate (B. M.) 298

Wilson, Clinton A.—Ocular Coloboma (Or.) 484
Wilson, Llewellyn E., and Tedstrom, Milo K.—Menstrual Hypoglycemia and Functional Dysmenorrhea: Their Relationship (Or.) 375
Woolf, Montague—Cancer of the Rectum (B. M.) 520

II

SUBJECTS—INDEX

A

Acute Appendicitis Associated with Acute Meckel's Diverticulitis—P. M. Hunter and E. F. Kehr (C. R.) 199
Acute Fluorin Poisoning—Jesse L. Carr (Or.) 83
Acute Perforation of Peptic Ulcer—Harold Lincoln Thompson (Or.) 469
Address of the President: Sixty-fifth Annual Session of the California Medical Association—Robert A. Peers (Or.) 464
Agranulocytosis—O. C. Railsback (Or.) 503
Agranulocytic Angina—W. H. Johnston (Or.) 20
Alameda County Hospitalization Plan: Its Importance (Ed.) 459
Annual Session of 1936: Headquarters at Hotel Del Coronado (Ed.) 73
Appellate Court Decision in Kern County Hospital Case Lays Foundation for a Proposed Initiative Law to Open County Hospitals (Ed.) 354
Artificial Fever as a Therapeutic Procedure—Norman N. Epstein (E. C.) 357
Aschheim-Zondek Test for Pregnancy, The—E. Henry Ruediger (Or.) 157

B

Basic Science Law of the State of Washington: Interesting State Supreme Court Decisions (Ed.) 252
Bilateral Salivary Calculi—H. P. Merrill (C. R.) 110
Biochemistry as It Is of Importance in Dermatology—Lawrence R. Taussig, Kendal Frost, George V. Kulchar, Frederick G. Novy, Jr., and Philip K. Allen (B. M.) 200
Biopsy in Malignant Disease—Otto H. Pflueger and W. P. Stowe (Or.) 99
Botulism, The Frequency of—Karl F. Meyer (Or.) 385
Brain Tumors in Children—A. J. Scott, Jr. (Or.) 25
Breast Support—Harry S. Fist (C. N.) 43

C

Cancer of the Breast—Alson R. Kilgore, H. J. Ullmann, and James F. Percy (B. M.) 47
Cancer Clinic, A Rural—William R. Dorr (Or.) 466
Cancer of the Rectum—William H. Kiger, Dudley Smith, and Montague Woolf (B. M.) 519
Cancer Studies: In Relation to Results of Treatment with an Aqueous Extract Made from the Cortex of the Suprarenal Gland—Walter B. Coffey and John D. Humber (Or.) 160
Carcinoma of the Prostate—A. J. Scholl, Nathan G. Hale, Lionel P. Player (B. M.) 298
Cardiac Care After Decompensation — R. Manning Clarke (Or.) 153
Cataracts Coincident with Dinitrophenol Therapy, Operative Results in—Hans Barkan, W. E. Borley, Max Fine, and Jerome Bettman (Or.) 360
Cataracts Following the Use of Dinitrophenol: A Summary of Thirty-Two Cases—Frank H. Rodin (Or.) 276
Chemical Peritonitis—E. M. Bingham and O. I. Cutler (C. R.) 45
Chylous Ascites in Lymphatic Leukemia—Windsor C. Cutting (C. R.) 198
Congenital Ichthyosis (Collodion Skin) — Roland P. Seitz (Or.) 500

SHARP & DOHME
No. 1675
Digitol

IN those cases of impaired cardiac efficiency where the digitalization of your patient is indicated, Digitol may be relied upon with confidence in the administration of digitalis. By laboratory test and by long clinical use, Digitol has clearly demonstrated its efficiency and reliability.

Digitol is standardized biologically by the U.S.P. method to a definite uniformity of potency. Digitol is uniform in action and contains therapeutically desirable constituents of the digitalis leaf, free of inert matter or precipitation.

Digitol-Mulford (Fat-Free Tincture of Digitalis) carries on the label the date of biological test. Digitol is offered only in one-ounce sealed amber bottles supplied with a specially designed, standardized dropper for ease and accuracy in administration.

There Is a Way of

"TELLING THE PHYSICIANS' STORY ETHICALLY"

A Director of the Physicians Expansion Bureau has been, or soon will be, in each city throughout the State to outline a plan of ethical advertising that will be scheduled to appear in each local newspaper weekly. The plan will be sponsored by one of the outstanding Prescription Druggists in each city. A large number of druggists have already sponsored this plan. Our yellow emblem identifies these stores.

These Better Health Talks that are to appear in the local newspaper weekly are designed to promote a closer relationship between the public and the Physicians. They also tend to counteract some of the detrimental propaganda fostered by the manufacturers of nostrums and cure-alls.

The coöperation of all Physicians is necessary in furthering this gracious gesture.

Physicians Expansion Bureau

AVAILABLE THROUGH ALL PHARMACIES

EMMENIN

The orally active, oestrogenic placental extract elaborated by Dr. J. B. Collip, Department of Biochemistry, McGill University.

(Canadian Medical Association Journal, February, 1930.)

IMPORTANT ANNOUNCEMENT . . .

By an improved technique developed in our laboratories, we have been able to render Emmenin entirely free from disagreeable taste and odor. This has been accomplished without loss of therapeutic activity, and the potency is ensured by carefully controlled biological assay.

DETAILS ON REQUEST

Emmenin is biologically assayed and standardized under direct control of the Department of Biochemistry, McGill University.

President. Fred A. Shore, 704 E. Santa Clara Street, Ventura.
Secretary. A. A. Morrison, 625 Main Street, Santa Paula.

Yolo-Colusa-Glenn County Medical Society

President, T. E. Cooper, Davis.
Secretary, Ray E. Nichols. Woodland.

Yuba-Sutter County Medical Society

President, Francis P. Wisner, 715 Hart Building, Marysville.
Secretary, Fred W. Didier, Wheatland.

READIER assimilation of Cod Liver Oil

Cod liver oil in MALTINE WITH COD LIVER OIL is easier of digestion than is plain cod liver oil. It offers readier assimilation and more complete utilization.

The process employed in the manufacture of MALTINE WITH COD LIVER OIL assures complete emulsification of the pure cod liver oil—30% by volume.

Many physicians who are frequent prescribers of cod liver oil are using MALTINE WITH COD LIVER OIL, not alone for its palatability, but because of its time-tested and guaranteed features. For example—*the vitamin A value of cod liver oil is enhanced twofold* when fed in the form of MALTINE WITH COD LIVER OIL. In addition, vitamins B, D, G and mineral salts are supplied.

MALTINE WITH COD LIVER OIL and Iron Iodide is also available, containing two grains of freshly prepared iron iodide per fluid ounce. Biological report on request. The Maltine Company, 60 Hudson St., New York City.

Awarded Ten Gold Medals

CO-OPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California and Nevada Associations. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

PLASTIC REPARATIVE SURGERY

This course includes diagnosis and determination of treatment; pre-operative preparation; anesthesia; operative technique; dressings; post-operative care; with special reference to utilization of the skin and other tissues in correction of disfigurement and replacement of loss, congenital or acquired. Operations on the cadaver. Particular attention is given to lectures, studies and demonstrations of advances in surgical anatomy, pathology, etc., with special reference to the problem actually under consideration.

THORACIC SURGERY

An intensive course. Surgical treatment of chronic suppuration of the lung (pulmonary tuberculosis, abscess of the lung, bronchiectasis) and tumors of the lung. Surgical lesions of the esophagus, heart and diaphragm. Empyemas. Witnessing of operations, cadaver operations, pathologic physiology, experimental surgery and bedside rounds. Indications for surgical treatment, pre-operative care and post-operative management.

POWELL *at* SUTTER

SAN FRANCISCO POLYCLINIC AND POSTGRADUATE COLLEGE

An Intensive Two Weeks' Course in

ABDOMINAL SURGERY

February 1st to 15th, 1936

SCOPE: The work will be limited principally to the abdomen and include the operative surgery of the following organs:

- STOMACH AND DUODENUM
- GALL-BLADDER AND BILE DUCTS
- SMALL INTESTINE
- COLON
- RECTUM
- KIDNEY AND URETER
- BLADDER AND PROSTATE
- MALE GENITAL ORGANS
- FEMALE GENITAL ORGANS
- HERNIAS

ANATOMY—A brief, systematic review will be given of the descriptive and surgical anatomy of the abdomen. This will include demonstrations on carefully dissected cadavers, and by dissections by the students themselves.

LABORATORY—This work will be done mostly on fresh human material. Special attention will be given to the latest methods of intestinal anastomoses, operations on the gall-bladder and bile ducts, three-row stomach technic, aseptic colon surgery, ribbon-gut operations on the kidneys, etc. Mimeographed copies of all directions and lectures on anatomy and technic will be furnished to the students free of charge.

WORK ON THE LIVING—Demonstrations of operations on the living will be given by some of the leading surgeons of San Francisco in the various hospitals. Opportunities will be given to assist in operations and to do a certain amount of operating on living subjects. THE FEE WILL BE $150.

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information inquire of

SAN FRANCISCO POLYCLINIC AND POSTGRADUATE COLLEGE, or

A. J. REMMEL, M. D., *Director of Operative Surgery* 1535 JACKSON STREET, SAN FRANCISCO

CLASSIFIED ADVERTISEMENTS

Rates for these insertions are $4 for fifty words or less; additional words 5 cents each.

COACHING FOR STATE BOARDS—MEDICAL AND Dental. Arthur H. White, M. D., Suite 1005, Flood Building, San Francisco.

FOR SALE—FISCHER TYPE "V" INTERMEDIATE diathermy apparatus. Chair for autocondensation and footstool. Dismantling office. Address Box 100, care of California and Western Medicine, 450 Sutter Street, San Francisco.

WANTED—YOUNG DOCTOR TO REPLACE MYSELF IN a prosperous Nevada agricultural community of 2,500 people near Reno. Two other doctors, but I am only one doing major surgery. Nothing to sell, but will introduce doctor personally to key families before I leave to seek health elsewhere. My immediate motive is to lease a large brick combined dwelling and office, heated with automatic oil, at a price that is less than renting any other place in town. Young surgeon of pleasing personality will probably collect better than $12,000 annually. Good references demanded. Address, Box 120, care of California and Western Medicine, 450 Sutter Street, San Francisco.

Food and Drug Fakers Punished by Fines.—Fines of more than $1,000 imposed by federal courts in a California jurisdiction was a highlight in a record of prosecutions as summarized by the Food and Drug Administration.

One of the big fines was the $1,200 penalty assessed against Joseph W. Spiker and Frank W. Kimball, who called themselves the Melatol Laboratories, Inc., Oakland, California. These men promoted "Melatol," which was nothing but crude oil, as a cure for diabetes. The medicine, selling at $5 for a box of 112 capsules, was "discovered" by Spiker, who, prior to 1930, sold it in Salt Lake City under the name "Paramount Oil." While doing business there, Spiker was told by the Utah authorities that the material was worthless in the treatment of diabetes. Because of the Utah objection, Spiker went to California and became associated with Kimball in the "Melatol" venture.

In the course of its investigation to prove fraud on the part of the manufacturers, as required by that portion of the Act having to do with medicinal claims on drugs, inspectors looked up the individuals whose names the concern had put forward from time to time as satisfied users of the product. The characteristic evidence was obtained—deaths from diabetes, advanced cases again using insulin, mild cases requiring only diet control, or no history of diabetes in spite of the patient's belief that he had the disease. Physicians specializing in the treatment of diabetes testified for the Government that "Melatol" could have no effect upon the course of the disease.

For shipments of dried fruits found to be insect-infested or otherwise filthy, California Packing Corporation, San Francisco, prunes and dried pears, total fines $400; California Prune and Apricot Growers' Association, San Jose, dried apples, $475; Albert Asher Company, San Francisco, dried grapes and dried peaches, total fines $350; Guggenhime & Company, San Francisco, dried peaches, $50; Consolidated Packing Campany, San Francisco, dried peaches, $50; Rosenberg Brothers & Company, San Francisco, dried apples, peaches, apricots and figs, total fines $550.

The School-Child's Breakfast.—Many a child is scolded for dullness when he should be treated for undernourishment. In hundreds of homes a "continental" breakfast of a roll and coffee is the rule. If, day after day, a child breaks the night's fast of twelve hours on this scant fare, small wonder that he is listless, nervous, or stupid at school. A happy solution to the problem is Pablum, Mead's Cereal cooked and dried. Six times richer than fluid milk in calcium, ten times higher than spinach in iron, and abundant in vitamins B and G, Pablum furnishes protective factors especially needed by the school-child.

Mead Johnson & Company, Evansville, Indiana, will supply reprints on request of physicians.

Medical Publishers.—Harper & Brothers announce that they have acquired the medical book publishing business of Paul B. Hoeber, Inc. A program of expansion is planned, and medical books will be published under the imprint of Paul B. Hoeber, Inc., Medical Book Department of Harper & Brothers. Paul B. Hoeber, the founder, remains in charge of this department.

The sublime and the ridiculous are often so nearly related that it is difficult to class them separately. One step above the sublime makes the ridiculous and one step above the ridiculous makes the sublime again.—Thomas Paine.

THE ART OF WORLDLY WISDOM

Martin Fischer's New Translation of the famous Spanish classic *Oraculo Manual Y Arte de Prudencia* (1653) by Padre Baltasar Gracian.

New Second Printing. (The first printing was taken largely by the medical profession of Cincinnati, San Francisco, and Syracuse.)

Being a collection of aphorisms which appear in the works of Baltasar Gracian, Spanish Jesuit, priest, philosopher, and thinker. Many times reprinted and widely translated, this epitome of life's rules is a happy volume of men of the world. Decidedly a book all of your acquaintances will wish to read. In two colors and on fine paper. $3.00

COOK COUNTY GRADUATE SCHOOL OF MEDICINE

(In affiliation with Cook County Hospital)

Announces Continuous Courses

MEDICINE—Informal Course; Personal Courses; Intensive Course, two weeks, starting January 13, 1936.
SURGERY—General Course, one, two, three and six months; Intensive Course, Surgical Technique, every two weeks; Special Courses.
GYNECOLOGY—Three Months Course; Intensive Course, two weeks, starting February 17, 1936; Selective Courses.
OBSTETRICS—Informal Course; Intensive Course, two weeks, starting February 3, 1936; Laboratory Course.
FRACTURES AND TRAUMATIC SURGERY—Informal Practical Course; Intensive Course, ten days, starting January 13, 1936.
PEDIATRICS—Informal Course; Personal Courses.
EAR, NOSE AND THROAT—Informal Course; Intensive Course, two weeks, starting April 6, 1936.
UROLOGY—General Course, two months; Intensive Course, two weeks; Special Courses.
CYSTOSCOPY—Intensive Course every two weeks (attendance limited).
General, Intensive and Special Courses in Tuberculosis, Ophthalmology, Roentgenology, Dermatology and Syphilology, Pathology, Neurology, Electrocardiography, Topographical and Surgical Anatomy, Physical Therapy, Gastro-enterology, Allergy, Hemorrhoids and Varicose Veins.

NUTRI-AD
ARTHROPHYLL
(6)
A Nutritional Adjuvant

IN a wide variety of cases involving Arthritis Deformans also Arthritic and Rheumatic disorders due to calcium deposition NUTRI-AD Arthrophyll (6) has accomplished favorable results to a degree heretofore unreported.

By making available prolific sources of organic phosphorus in a highly assimilable state it is apparent that this natural agency for increased calcium excretion has been provided. » » » » » » » »

This procedure together with inducing normal bowel elimination offers a likely solution to this stubborn and widely prevalent pathology. » » » » » » »

NUTRI-AD—ARTHROPHYLL (6) consists of the concentrates of green leafy vegetables so compounded and proportioned as to supply a maximum of phosphorus and a minimum of calcium through which the offending calcium deposits are disintegrated and excreted.

NUTRI-AD—ARTHROPHYLL (6) is available only in prescription form through the ethical medical profession. Literature gladly furnished on request.

The real wealth of the nation does not consist in its money, in the value of its trade, or in the extent of its dominion. These are valuable only as they help to maintain a population and not only a part of it, of the right quality; men, women and children possessing bodily vigor, alert mind, firm character, courage and self-control.—Sir Arthur Newsholme.

THE CANNING PROCEDURE

• Some misunderstandings exist as to the mechanics of the commercial canning procedures. Although some such information is available (1) (2), it is not surprising that the facts are not more generally known. The art of canning has been largely developed by, and retained within, the industry.

Of necessity, canning procedures vary with the product packed. However, it is possible to indicate in broad detail the treatment to which foods may be subjected during canning.

Cleansing Operations

Raw materials are given a thorough water cleansing, usually by washing under high pressure sprays.

Preparatory Operations

Following washing, undesirable stock is removed by sorting, trimming, peeling and coring operations, as occasion may demand. With some products these operations are performed mechanically.

Blanching

Certain products are "blanched" or scalded by immersion in hot water. This process serves not only to clean the product further, but also to soften the tissues and expel air therefrom.

Preheating and Filling Operations

Here practice varies with the product. Sometimes the food is precooked and filled into cans; again, it may be filled into cans and hot water or hot salt and/or sugar solutions added; still again, the filled cans are "exhausted" in a steam or hot water box. All these operations, the majority of which are mechanically performed, serve to preheat the product and exclude air from the cans.

Sealing, Processing and Cooling Operations

The filled cans are hermetically sealed on an automatic "closing" machine while the contents are still hot; the sealed cans are then heat processed to destroy spoilage micro-organisms; finally, the cans are cooled in water or air. Cooling contracts the contents and produces a vacuum within the can.

Such are the broad details of the canning procedure. We trust this brief word picture will bring better understanding of the treatments to which canned foods are subjected.

AMERICAN CAN COMPANY

This is the eighth in a series of monthly articles, which will summarize, for your convenience, the conclusions about canned foods which authorities in nutritional research have reached. We want to make this series valuable to you, and so we ask your help. Will you tell us on a post card addressed to the American Can Company, New York, N. Y., what phases of canned foods knowledge are of greatest interest to you? Your suggestions will determine the subject matter of future articles.

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Committee on Foods of the American Medical Association.

LIVERMORE SANITARIUM

The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

A System for the
Collection of Fees
that has proved its worth ~

Our bookkeeper fails to find your account settled on our books. Please help him out.

PAST DUE!

☞ *This Account has no doubt escaped your notice. Will you please favor us with a remittance by return mail and oblige?*

THIS ACCOUNT
IS PAST DUE.
PLEASE REMIT.

Regarding Your Past-Due Account

Our records show that several statements and reminders have been sent you regarding the enclosed statement.

If your circumstances have made it impossible for you to pay the amount due, kindly write us promptly to that effect. Our office will then endeavor to extend all possible courtesies.

You appreciate, we are sure, that physicians, like other citizens, must pay their bills promptly. They can only do so, however, when their own clients in turn pay them promptly for such professional services as may have been rendered.

A check to cover your account, which is now considerably overdue, will be appreciated.

Final Notice

In practically all businesses the custom which is generally followed with overdue accounts is to send such to a collecting agency.

Our bookkeeper has nothing in the records of the office to show when you intend to pay the enclosed account. Perhaps the previous statements and reminders may have been overlooked or ignored.

Following the rule of this office, this overdue account will be sent to the collecting agency within ten days if arrangements for its settlement are not made prior to that time.

This collection bureau method is disagreeable to us; and we believe, also to you. By promptly sending your check all this can be avoided.

When an account is sent to the collecting agency that organization takes full charge of it thereafter.

IN THE SEPTEMBER, 1927, issue of CALIFORNIA AND WESTERN MEDICINE, page 398, appeared an article relating to the "collection of fees." Following this publication so many orders were received by us for printing the series of gum stickers and notices, we decided to print and stock the series in large quantities.

That we were justified in this decision is evidenced by the fact that thousands of these notices have been used by the medical profession of California. They *get* results. Many users of the system have reordered the series.

You, too, can profit by using the system for your delinquent accounts. They are inexpensive and easy to use.

The prices, including postage, are:

250	$ 6.75
500	9.00
1000	13.50

SINCE THE *Turn* OF THE CENTURY

From an Address by J. K. Lilly, Chairman of the Board, Eli Lilly and Company

"Until the turn into the present century, most of the large-scale producers limited their scientific endeavors to the use of established facts and current knowledge, but the past thirty-five years have witnessed a substantial advance into the field of real medical and chemical research. During this period, a fine spirit of co-operation between groups of scientists and the research and producing sections of large-scale operators has come into being. These joint endeavors have attained many large objectives and promise to continue thus, to the everlasting benefit of scientific medicine."

BOOK REVIEWS

Corrective Rhinoplastic Surgery. By Joseph Safian, M.D. Pp. 218, with 242 illustrations by Joseph Tamerin, M.D. Cloth. New York: Paul B. Hoeber, Inc., 1935. Price, $9.

Emphasis is laid on the preparation of patients for rhinoplastic procedure, the need of proper asepsis, operating room equipment and preoperative preparation as in any major surgical procedure. Local anesthesia the anesthesia of choice.

A limited description of the surgical anatomy of the nose as well as the artistic anatomy is given. A measure, the photometer, is described to obtain the proper nose-face proportions.

In hypertrophies of the nose the incisions are all intranasal, nasal humps removed with saws, nasal base narrowed by additional saw cuts and any reduction of the tip or length corrected by excising appropriate tip or septal cartilage. Instruments used are practically all those devised by Doctor Josephs for rhinoplastic surgery.

In hypertrophies of the cartilaginous portion of the nose, septal or ala cartilages are excised intranasally according to whatever cartilage is the offender. The columella is sutured to the septal cartilage by through and through silk sutures. It may be necessary to excise part of one or all of the nasal cartilages, depending on the type of nasal deformity.

In prominent nostrils excision of the mucosa or mucosa and skin at the tip or base will correct abnormalities in these positions. Small nostrils, or stenosis of the nostrils, are corrected by turning in adjacent skin flaps after correcting the defect or using epithelial inlay to supply the lining.

Safian believes as a general rule that septal resections should be done about two or three months after nasal plastic procedures.

In the correction of saddle nose the dorsum of the nasal soft parts is elevated through intranasal incisions and the supporting structure aseptically introduced. If the nasal tip as well as the nasal bridge needs support, he favors the mid-columella incision for placing his nasal post. Cartilage is his preference for correcting the nasal defect, but he uses prepared ivory implants freely in children, small depressions in individuals not desiring a rib resection. In compound saddle noses appropriate incision with a return of the nasal structures to their normal location is advocated and then filling in the soft tissue defects by lining with adjacent skin flaps and covering with Indian forehead flaps.

In recent fractures of the nasal elements Safian replaces all deviated structures as soon as possible and splints the nose internally with packing and tubes, and externally with a nasal splint.

The author considers deviations of the nasal bones, cartilages and tips separately, and corrects them separately or together, depending upon the type of deviation present. He cautions against true and apparent unilateral nasal deviation. All deviations are corrected intranasally, correcting the bony deviations by subcutaneous saw cuts or bony excisions as needed; cartilaginous deviations by remobilizing the cartilage whether septal or nasal tip and suturing them into their proper positions.

Safian condemns the use of parafin injections for the correction of various facial deformities.

Throughout the whole text Safian describes only the standard methods of nasal reconstruction as performed by such men as Josephs, Gillies, Gratton, Lexor, New, Langenbeck, etc., and his own methods and modifications that have given him satisfactory results.

BOOK REVIEWS

(Continued from Preceding Page)

Nutrition of Mother and Child. By C. Ulysses Moore. Fourth edition. Pp. 258. Illustrated. Philadelphia and London: J. B. Lippincott Company. Price, $2.

This relatively small 258-page book is an excellent summary on the subject of nutrition of mother and child. The text is simple, which makes it an excellent book for nurses, mothers, or other lay persons. Particularly does it seem of value to the prospective mother, as there is nothing couched in terms she would not understand and the direct fashion of the author would be convincing. Throughout, the subject matter is up to date and there seems nothing to which one might take exception.

Particularly forceful and illuminating is the author's discussion of breast feeding and its value. Today, when so many babies are bottle fed needlessly, the mother can not be too strongly coached on the value of breast feeding. The chapter on breast feeding and methods of breast expression could be read with inestimable benefit by the medical profession at large. While Doctor Moore may go to an extreme, it would not hurt the general profession to pick up some of his enthusiasm.

H. G. W.

Complete Handbook on State Medicine. J. Weston Walch, compiler. Pp. 150. Portland, Maine: Debaters Information Bureau, 1935. Price, $2.50.

Title is wrong, as it is not a "complete" handbook. Its extracts and references do an injustice to proponents and opponents, because a broad picture is not given of the opinion or argument advanced by the quoted reference. There is no evidence given that quoted authorities are competent to discuss the question. This handbook will go far in producing wrong conceptions and conclusions.

F. C. W.

(Continued on Page 20)

PREVENT KETOSIS OF PREGNANCY WITH KARO IN THE PRENATAL DIET

> "Enlarging of the uterus often causes reflex vomiting. Unless carbohydrate is taken throughout the day to maintain the blood sugar at high levels, Ketosis results. This disturbance aggravates the vomiting, frequently beyond control because of the inability of the damaged liver in pregnancy to resist Ketosis."
>
> —*Kugelmass, Clinical Nutrition in Infancy and Childhood (p. 53)*

KARO is an ideal carbohydrate to combat Ketosis. Karo consists of palatable maltose and dextrose (with a small percentage of sucrose added for flavor) quickly absorbed and the non-fermentable dextrins that are gradually transformed into simple monosaccharides. Karo can, therefore, be fed in larger amounts than simple sugars without danger of digestive disorders—fermentation, distention, diarrhea...Karo may be added as Syrup or Powder to milk, cereals, gruels, fruits, vegetables, desserts and refreshments. Whatever the prenatal dietary indicated, Karo will furnish the mixed sugars necessary to combat Ketosis. And the earlier in pregnancy the addition is made the less the danger of Ketosis.

For use in the Prevention and Treatment of The Acid-Ash Type of

BOOK REVIEWS

(Continued from Page 18)

Disorders of the Blood—Diagnosis, Pathology, Treatment and Technique. By Lionel E. H. Whitby and C. J. C. Britton. Illustrated. Pp. 543. Philadelphia: P. Blakiston's Son & Company, Inc., 1935. Price, $7.

The authors, pathologists who have worked together at the Middlesex Hospital, London, present a well indexed, well illustrated 523-page book on blood disease which is up to date, comprehensive and demonstrates how completely the work of Sabin, Doan, Minot and Castle has been accepted in England. Clinical features, rarer forms of blood dyscrasia, and technical methods are dealt with in clear detailed but occasionally repetitious manner.

W. D.

Emotions and Bodily Changes. A Survey of Literature on Psychosomatic Interrelationships 1910-1933. By H. Flanders Dunbar. Pp. 595. New York: Published for the Hosiah Macy, Jr., Foundation by Columbia University Press. 1935. Price, $5.

As indicated in the sub-title, this volume consists of short abstracts of research in this field from 1912 to 1933 and displays an industry and patience which really compels awe. This will be apparent when one sees that the bibliography covers 128 pages and includes 2,251 items. There is a proportionately long index of names and of subjects.

It should be an extremely valuable reference book for anyone engaged in the study of the relation of emotions to somatic changes.

E. W. T.

Diseases of the Skin. By Frank Crozer Knowles. Third edition. Illustrated. Philadelphia: Lea & Febiger, 1935.

This is a small volume intended primarily for the undergraduate student. It necessarily is not as complete as some of the larger texts.

The chapters on dermatitis (eczema), psoriasis, and erythema nodosum are particularly good. The treatment of syphilis is given in a concise and excellent manner.

CONSIDER the significance of this statement. For behind this product are the extensive resources of the House of Squibb. Insulin research in the Squibb Laboratories has never ceased. Many refinements in its preparation have been introduced and many additional steps in its manufacture have become routine to make the Squibb quality of Insulin possible.

Insulin Squibb is highly purified, highly stable and remarkably free from protein reaction-producing substances. Great care is taken in its assay that it may be uniformly potent.

More institutions, more physicians, more patients are using Squibb Insulin than ever before. For these users are convinced of the quality and dependability of the Squibb product.

INSULIN SQUIBB

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M.D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer Wassermanns, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

BOOK REVIEWS

(Continued from Page 20)

Bismuth therapy should have been discussed in more detail. In some instances the space allotted to certain subjects is an indication of the author's interest in that particular subject and not due to its relative importance. Erythema of the ninth day and diphtheria of the skin each cover an entire page. Blastomycosis covers four pages, while coccidioidal granuloma is not mentioned.

There are some statements that are not generally accepted. The author states that tinea versicolor, psoriasis, and pityriasis rosea are papular diseases. Other authors classify them as macular. Actinomycosis is said to be commonly contracted from cattle and horses or from chewing straws. The recent literature on this subject states that animal to man transmission does not occur and that the theory in regard to chewing straws has been discarded. The author treats milia with trichloracetic acid, while most dermatologists simply remove them. The dosage of one-half a skin unit of x-ray every two weeks for eight treatments for acne is more than is generally used. Radium treatment and one hundred milligram doses of gold sodium thiosulphate for lupus erythematosis are not routinely given by most dermatologists at the present time. The treatment of large or hairy moles with x-ray is also a debatable procedure.

The photographs in general are good and are well chosen. The paper and printing are excellent. The book will undoubtedly be found to be of value by the undergraduate student and the general practitioner of medicine.

H. E. M.

Objective and Experimental Psychiatry. By D. Ewen Cameron. Pp. 271. New York: The Macmillan Company, 1935. Price, $3.

The effort of psychiatry to become a science by use of methods identical with or similar to those used by the acknowledged sciences is set forth in this book.

That the end is not yet achieved is no discredit to the psychiatrists. Even sciences based upon mathematics have not reached their goals. One may infer from the chapter headings which follow the line of reasoning which the author takes: Experimentation and Quantitation;

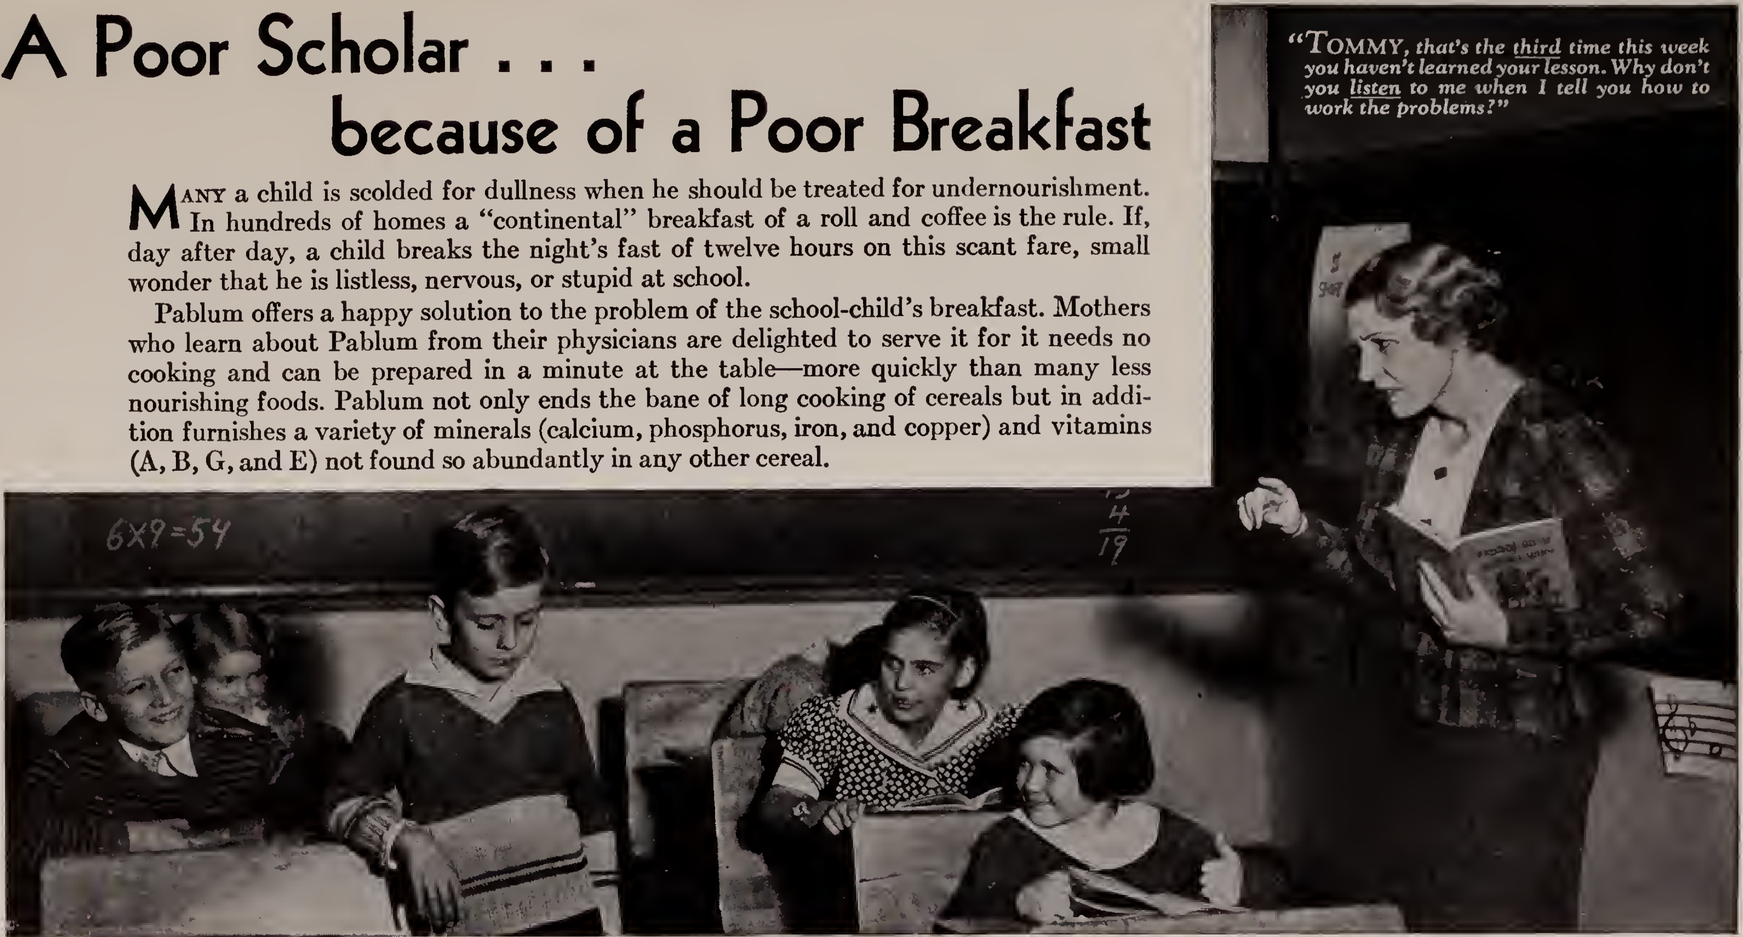
THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

A Poor Scholar . . . because of a Poor Breakfast

MANY a child is scolded for dullness when he should be treated for undernourishment. In hundreds of homes a "continental" breakfast of a roll and coffee is the rule. If, day after day, a child breaks the night's fast of twelve hours on this scant fare, small wonder that he is listless, nervous, or stupid at school.

Pablum offers a happy solution to the problem of the school-child's breakfast. Mothers who learn about Pablum from their physicians are delighted to serve it for it needs no cooking and can be prepared in a minute at the table—more quickly than many less nourishing foods. Pablum not only ends the bane of long cooking of cereals but in addition furnishes a variety of minerals (calcium, phosphorus, iron, and copper) and vitamins (A, B, G, and E) not found so abundantly in any other cereal.



"TOMMY, that's the third time this week you haven't learned your lesson. Why don't you listen to me when I tell you how to work the problems?"

PABLUM is rich in calcium and iron, minerals likely to be deficient in the school-child's diet yet needed in more than average amounts during childhood. Pablum is 6 times richer than fluid milk in calcium and contains 10 times more iron than does spinach. It also furnishes generous amounts of vitamins B and G, essential for normal appetite. Unlike other cereals, Pablum is base-forming, important because the growing child needs to store alkali. The nutritional value of Pablum is attested in studies by Crimm *et al* who found that tuberculous children receiving supplements of Pablum showed greater weight-gain, greater increase in hemoglobin, and higher serum-calcium values than a control group fed farina. Reprint sent on request of physicians. Mead Johnson & Company, Evansville, Ind., U.S.A.

Pablum (Mead's Cereal thoroughly cooked) is a palatable cereal enriched with vitamin- and mineral-containing foods, consisting of wheatmeal, oatmeal, cornmeal, wheat embryo, alfalfa leaf, beef bone, brewers' yeast, iron salt, and sodium chloride.

Please enclose professional card when requesting samples of Mead Johnson products to cooperate in preventing their reaching unauthorized persons

TWENTY-FIVE YEARS AGO

(Continued from Page 23)

. . . There is no doubt "606" has a marvelous effect on active syphilitic lesions, whether primary, secondary, tertiary, or hereditary. What action it will have on such manifestations of syphilis as tabes and paresis can only be determined after long observation. . . . According to the first reports this remedy seemed strangely free from evil or disagreeable results, for, after all, the drug contains arsenic. . . .

From an article on "Serum Diagnosis of Syphilis" by L. S. Schmitt, M. D., San Francisco.

The serum diagnosis of syphilis is based upon the principle first expounded by Bordet & Gengou (Annales de Instit. Pasteur, Vol. 15, No. 3, p. 290, 1901), viz., that in infectious diseases there is a definite relation between the antibodies found in the patient's serum and the antigen (microörganisms, etc.), which formed them. . . .

Summary.—1. The Wassermann and the Noguchi methods are more reliable of all reported, by reason of the fact that the quantities of each reagent can be exactly determined.

2. The precipitate tests are not as reliable as the complement fixation reaction.

3. The value of the complement fixation reaction in the diagnosis of syphilis *per se* and as an etiologic factor has passed the stage of experimentation.

4. The reaction is of service as an index to the efficiency of treatment.

5. The results of the test have proved that mercury is the main drug to be relied on during treatment of acute syphilis.

From an article on "Insects and Medicine—A Lecture,"[2] *by Creighton Wellman, B. A., M. D., Oakland.*

Medical entomology, or rather medical arthropodology, is not a new science, but a realization of its far-reaching importance is one of the hopeful signs of the present day. . . .

From an article on "The Coöperation of School Health Departments with Other Health Agencies" by Ernest B. Hoag, M. D., Berkeley.

Medical supervision of schools is rapidly becoming an increasingly important factor in modern education. The necessity for such careful supervision of the health and development of school children is no longer an open question. . . .

The result of the combination thus described is that all of the health agencies, including the School Health Department, the City Health Department, the Charity Organization, the Medical Dispensary, the Dental Dispensary, are now located within one block of one another and are combined under three roofs instead of five. . . .

(1) The School Health Department; (2) the City Health Department; (3) the Charity Organization; (4) the Medical Dispensary; (5) the Dental Dispensary; (6) the City Charity Commission; (7) the Red Cross Society.

What has been done on a small scale in Berkeley, the State Board of Health and State Medical Society have done on a much larger one. At the last meeting of the State Society and Public Health Association, the "Cali-

CONSIDER THIS MATTER OF SUPPORT

Many physicians agree that there are certain situations in which the muscles and connective tissues are unable to do their work, as for instance—in some cases of pregnancy, visceroptosis, hernia, sacro-iliac disturbances, postoperative conditions and the like. When either abdominal or back support is deemed by the physician requisite to a return to physiologic balance . . . and a fabric garment is prescribed for this purpose . . . the great difficulty—it will be admitted—is to secure supports that are scientifically constructed, reasonably priced and properly fitted to the individual. It has been the definite objective of S. H. Camp and Company for over a quarter of century to manufacture supports with these qualifications.

The attainment of these three desiderata has involved many busy years of research and collaboration with leading surgeons, gynecologists, obstetricians, internists and orthopedists. To heed the stern dictates of eminent physicians for trial and retrial, to adhere to Camp standards of quality of merchandise and workmanship, and at the same time to keep manufacturing costs—and therefore retail price—within reasonable bounds has represented an achievement of no mean proportions.

To insure the proper fitting of supports, to acquaint the profession with Camp models and to keep both physicians and fitters apprised of new garments, it has been necessary to establish the Camp Professional Support Service. With the development of this Service and the excellence of Camp Supports has been won the approval of such organizations as the American Medical Association and the American College of Surgeons.

In the announcements which are to be featured this year, we propose to explain in detail the various phases of the Camp Professional Support Service . . . how each factor in the Service helps to solve this matter of supports—to provide garments scientifically constructed, reasonably priced and properly fitted to the individual.

[3] Read at the eighth annual meeting of the Pacific Association of Railway Surgeons, San Francisco, August, 1910.

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

in schools to make a determination of just how far a chiropractor could be permitted to go. The court itself made no effort to define the term 'chiropractic.' . . ." (San Bernardino *Sun,* November 19, 1935.)

"Declaring he is the personal physician to Emperor Haile Selassie of Ethiopia, and a friend of Mahatma Gandhi, J. E. S. S. Morandhi, 64-year-old negro, was arrested here today for asserted violation of the State Medical Practice Act. Investigating officers said the man had treated three negro women here, and was practicing medicine without a license. Morandhi, who also is a preacher, says he is the chief of Haile Selassie's medical staff." (Press dispatch dated San Diego, December 5, 1935, and printed in the Los Angeles *Times,* December 6, 1935.)

"Dr. Andres R. Stadin, Los Angeles-trained surgeon. . . . was in the thick of the bombing yesterday in remote Dessye, Ethiopia, according to dispatches. With him under fire, his friends here presumed, was his courageous wife, a graduate nurse and her husband's assistant in managing the Dessye Station Hospital. . . . It was built in 1926 under the direction of Dr. George C. Bergman, also of Los Angeles, and now chief surgeon at Addis Ababa to Emperor Haile Selassie. . . . Anxiety was also felt yesterday by members of the College of Medical Evangelists for Dr. Tesla C. Nicola, who left Montebello two years ago for missionary service in Ethiopia. . . ." (Los Angeles *Illustrated Daily News,* December 7, 1935.)

"He was a 'doctor,' he told Loney Peacock, Ford agency salesman at El Centro, and he nursed a close-cropped blond moustache while he critically discussed the new car Peacock praised. Then Peacock drew up a detailed statement of price for car, insurance, brokerage, carrying charge, or whatever the dealers call the various items they add to the f. o. b. cost. The 'doctor' decided to try the car in a test run. He climbed behind the wheel, a youngster, eighteen, and two women got in with him and they drove away. He has not come back. Peacock asked the law to make inquiries, and the law found the 'doctor' and the new car last night had passed the inspection station on the Los Angeles highway at Truckhaven, bound in the direction of Indio." (Brawley *News,* November 26, 1935.)

"Attorney-General U. S. Webb has ruled that a chiropractor has no legal right in California to hold himself out as being entitled to do obstetrics. . . . Webb stated obstetrics is not included in the field of chiropractic. . . ." (Marysville *Star,* November 24, 1935.)

"Careful scrutiny of narcotic prescriptions issued by physicians with a view toward ascertaining if the Harrison Narcotic Act is being violated, was started yesterday by local federal narcotic agents, following the arrest in Riverside of Dr. William B. Payton. Doctor Payton was taken in custody and charged with issuing unlawful narcotic prescriptions. Arresting agents asserted he had dispensed several unlawful prescriptions in recent weeks. . . ." (Los Angeles *Times,* November 28, 1935.)

"William D. Noland, 3944 Wilshire Boulevard, who advertised himself as a 'bloodless surgeon' and was convicted last week of practicing medicine without a license, today was sentenced to pay a $200 fine and given a stay of execution until Friday to pay it. Municipal Judge Irv-

NOBODY *wants* TO BE
A GUINEA PIG !

And nobody* NEEDS *to assume the role of an experimental animal where Vitamins A and D are concerned

For wherever and whenever Abbott's Haliver Oil with Viosterol is prescribed it can be depended upon to deliver those prized vitamins in full measure. Methods and assays used in the product's manufacture assure that.

Three or more rigid assays establish the potency of each lot of Abbott's Haliver Oil before any of it is released. These assays are made under ideal conditions in a new, modern laboratory, complete even to air conditioning. And that is not the end of Abbott Laboratories' vigilance in making sure that every drop, every capsule of Abbott's Haliver Oil sold has its full vitamin content. For, from representative lots, samples are kept. These are biologically assayed at intervals to verify the vitamin potency and stability of the Abbott brand of this product awaiting your prescriptions on drug store shelves.

To make sure your patients receive nothing less than the excellence and potency which Abbott's Haliver Oil with Viosterol offers, make it a practice to write your prescriptions for this product—specify *Abbott!*

Abbott's Haliver Oil with Viosterol has acceptance for New and Nonofficial Remedies of the Council on Pharmacy and Chemistry of the American Medical Association. It is available in every prescription pharmacy in boxes of 25 and 100 3-minim soft, elastic capsules; and in 5-cc. and 50-cc. vials with special droppers. Sold to patients on prescription at reasonable cost. ABBOTT LABORATORIES, North Chicago, Illinois.

HEALTH INSURANCE QUESTIONNAIRE: RESULTS IN POLL OF CALIFORNIA PHYSICIANS

How the Voting Stood on December 18.—The December number of the JOURNAL commented (on page 395) on the post card-questionnaire regarding health insurance mailed on November 25 to all licensed physicians in California on whom had been conferred the degree of doctor of medicine. Members of the Association will be interested in the replies received, up to date of December 18. The respective totals, as shown practically a month after the card was sent out, will probably vary but little from the final figures, when the voting is closed. Association Secretary Warnshuis at our request has sent to us the following figures:

QUESTION	YES	NO
1. Shall the California Medical Association endorse any legislative change in the present system of medical practice?	1162	1947
2. Are you in favor of compulsory health insurance?	848	2645
3. Are you in favor of voluntary health insurance?	1630	1130
(*a*) Voluntary health insurance carried on by the State of California?	282	685
(*b*) Voluntary health insurance carried on by lay companies under legislative control?	255	677
(*c*) Voluntary health insurance carried on by some form of organization of licensed physicians of California created by legislation?	2569	803

* * *

The Ballot Returns, when Reduced to Percentages.—When the above totals are reduced to percentages, it is noted, as regards the question concerning endorsement by the California Medical Association, that a total of 3,109 physicians (inclusive of both members and nonmembers of the California Medical Association) voted on this question, and that about 37 per cent were in favor, while some 63 per cent were against the California Medical Association endorsement.

On Question 2, that of compulsory health insurance, with 3,493 votes cast, 76 per cent of the physicians voted against compulsory health insurance, with 24 per cent in favor.

---

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column, which follows.

Voluntary insurance (Question 3) received a total of 2,760 votes, of which about 58 per cent were in favor of such a system, and 41 per cent against.

* * *

Tentative Conclusions on the Ballot Results to Date.—These tabulations, on the major questions submitted, in so far as tentative conclusions may be drawn from ballots cast to date, would indicate:

(1) That about 60 per cent of the licensed physicians of California are opposed to official endorsement by the California Medical Association of a legislative change in the present form of medical practice;

(2) That practically 76 per cent of the licensed physicians of the State are opposed to compulsory health insurance; and

(3) That about 58 per cent of the licensed physicians are in favor of some form of voluntary health insurance.

The final compilation will be submitted to the Council at its January 18 meeting and a report thereon made in the February Journal. Readers who have not cast their ballots are urged to do so.

* * *

Interesting Comments of Senator Dan E. Williams, Chairman of the Late Interim Committee on Health Insurance.—In connection with the above, it may be permissible to refer to a letter received from Senator Dan E. Williams, who was chairman of the Senate Interim Committee that had charge of Senate Bill 454 in the last legislative session. Our attention was called to an address which Senator Williams made in Los Angeles, and in response to our letter for a copy of his remarks, he wrote:

> I am in receipt of your request for a copy of my talk before the Los Angeles County Medical Society on November 13. I happen to have a copy of this rather carelessly prepared talk and am sending it to you herewith.
>
> Friday night last [December 6] I had the pleasure of being with the San Joaquin County Medical Society at their annual meeting in Stockton, and the report of the preliminary ballots is not so widely at variance with my statement that the medical profession—at least 90 per cent—were opposed to compulsory health insurance. The 83 per cent favoring voluntary insurance clearly indicated the trend in this situation, and made my guess a pretty good one.

* * *

Excerpt from Senator Williams' Address.—Because Senator Williams is also a member of the new Senate Interim Committee on Health Insurance, some paragraphs from his Los Angeles address, as reflecting his layman's and legislator's point of view, may be of interest:

> . . . For a quarter of a century I have been interested in legislation having to do with health (for that is the time, with slight intermission, that I have served the State in the legislature) and in every session I have served on the Public Health Committee, frequently as chairman.
>
> The Committee on Public Health has to do with your problems and most everybody else's. . . . Medical and dental laws are just incidental to this committee. Everything having to do with public health comes to the hopper of this committee. From termites to tomatoes; from oleomargarine to osteopaths, we regulate ceaselessly and without batting an eye. No longer can the advertising dentist or doctor issue "lure" advertising; no longer need we fear the wiles of the painted beauty with the false set of teeth who would betray us for $5 and our old set. We have that all fixed, and "painlessly," says Doctor Parker.
>
> The doctor has come in for his share of regulation. Most of this regulatory law has been at his own instigation. The people have not been greatly concerned over it as yet.
>
> At times doctors and dentists have come into our political picture, and always a druggist or two, so at times we have had the benefit of experience; but they always fade out, and we laymen have to struggle along with our regulating by ourselves. I am satisfied if we ever had two doctors or two dentists elected at the same time to our legislature we would have no medical or dental laws during that particular session, so close in agreement are men in these particular professions. . . .
>
> In due time the bill—Senate Bill No. 454—was introduced in the Senate and referred to the Senate Committee on Public Health. This committee of seven members agreed with me that all this bill needed was amendments. I presented numerous proposed changes, and they were adopted by a committee vote of 5 to 2.
>
> With only two votes for the bill, amended out of all semblance of its original intention, no further consideration was given to it. It died a natural and a painless death. May it forever rest in peace. But regardless of the ultimate fate of this bill, a militant minority of approximately 10 per cent of the doctors of the State had scared the life out of a timid fearful 90 per cent of the profession. . . .
>
> Compulsory insurance, hated by most of our physicians, became a dead issue. Big and little business was against it. Labor was for it, if not assessed for its maintenance, and against it, if it (labor) was made to pay the costs. . . .

QUALIFYING CERTIFICATE (BASIC SCIENCE) INITIATIVE TO BE POSTPONED: REASON, THE NEW REGISTRATION LAW OF CALIFORNIA

Results of the Ballot on Council's Referendum.—As already stated on page 395 of the December number of California and Western Medicine, the Council, under date of November 12, 1935, ordered a referendum in order to learn whether the members of the Association were in favor of spending up to $35,000 of the Association's reserve funds, to place a proposed Qualifying Certificate (Basic Science) law on the November, 1936, ballot, the details of which referendum are given in last month's issue.

Up to December 18, a total of 2,334 replies had been received at the Association's office—2,051 for, and only 283 against the proposition. The vote as cast, therefore, indicated that about 90 per cent of the members were in favor of a qualifying certificate law, containing the provisions outlined on page 321 of the November issue of the official Journal. A vote so favorable could be construed as nothing less than a definite mandate to the Council to proceed.

* * *

Supreme Court's Decision on California's New Registration Law Changed the Situation.—However, "circumstances alter cases," and in this matter, the change of outlook came from a recent ruling of the California Supreme Court, on certain registration amendments passed by the 1935 Legislature, whereby many thousands of voters now registered would not only not be eligible to vote after January 1, 1936, but also not eligible to sign initiative petitions, until such time as they re-registered. In other words, present indications are that some hundreds of thousands of voters, unbeknown at the present time to themselves, will not be eligible to vote in the May presidential primaries. Many of these citizens would be contacted when initiative petitions were being circulated, thus greatly increasing the number of invalid signatures. In fact, so great might be the error that the requisite number of valid 186,378 signatures (which it is necessary to have in hand and attested by county registrars of voters and state officials) would be most difficult to secure. In case the initiative petition lacked only a few of the 186,378 signatures needed, all the money expended at 10 cents a name, amounting to a possible total of $25,000, might be lost; besides it must be remembered that, in submitting to the Secretary of State the petitions required by law, almost an extra thirty to forty thousand signatures would be necessary to eliminate error and legal complications.

* * *

Special Committee on Qualifying Certificate Law Recommends to Council that the Proposed Initiative Be Placed on Ballot in 1938.—In a meeting of the Special Committee held at San Francisco on December 14, it was unanimously voted by those present to report to the Council the inadvisability of placing the Qualifying Certificate Initiative on the November, 1936, ballot. The members of the Special Committee were of the opinion that, with proper alertness in legislative matters, the *status quo* of healing art laws could be maintained until the November, 1938, election; and under such conditions, the committee members felt they were not justified in counseling a course of action that might jeopardize reserve funds of the Association. The Council will act on the recommendation at its meeting on January 18.

* * *

Study and Drafting of the Proposed Initiative Will Be Continued by the Special Committee and Council.—In the meantime, the Special Committee is proceeding with its study and draft of the proposed law; and such continued consideration of the legal phraseology on a statute submitted at great expense to the vote of the electorate can only make for a better qualifying certificate law. In due time, therefore, additional progress reports will be made.

* * *

Secretary of State Jordan's Letter to California Medical Association President Peers.—To the above comments may be added the following letter, written by Secretary of State Frank C. Jordan to Doctor Robert A. Peers, president of the California Medical Association:

> In reply to your letter of the 9th, with respect to registration of voters and signatures necessary for initiative measures.
>
> The last registration of this State, for the special election held August 13, 1935, totaled 2,622,782. A new registration will go into effect the first of next year. It would be rather difficult to estimate how many of this figure would re-register between the first of the year and the fortieth day prior to the May Presidential Primary.
>
> It has been estimated that some 500,000 now on registration are not entitled to vote, due to various so-called evils of the present permanent registration. In normal years we do not believe more than 1,500,000 would register in the three months. However, due to the May Presidential Primary the figure may reach 1,750,000.
>
> Signatures on initiative petitions may be obtained at any time after the first of the year and can be filed with the county clerks up to the 110th day prior to the November election. The number of signatures of qualified electors necessary to qualify an initiative is 186,378.

SENATE BILL 392, CHAPTER 638, UNCONSTITUTIONAL: BILL TO LICENSE CLINICAL LABORATORY TECHNICIANS DECLARED NULL AND VOID

Senate Bill 392 Was Enacted by the 1935 Legislature.—One of the proposed statutes submitted to the 1935 California Legislature was Senate Bill 392, its title being:

> "An act relating to the conduct of clinical laboratories and the licensing of clinical laboratory technologists and clinical laboratory technicians and the issuance of permits to physicians and surgeons conducting clinical laboratories for the purpose of protecting the public health and to provide penalties for the violation of the provisions of this act."

This bill received critical attention during its consideration in the Senate and Assembly, but was finally passed, receiving on July 15, 1935, the approval of Governor Frank Merriam. Complying with the provisions of the bill, the State Board of Health submitted to the office of Attorney General U. S. Webb, for opinion, certain proposed regulations. In reply, the Attorney General, through Deputy Lionel Browne, under date of November 19, 1935, wrote that his office considered "the entire act unconstitutional and hence without force or effect."*

The lesson to be learned from this mistaken enacting, as also from the making of other laws by the last legislature and now in legal question, is the importance of deep consideration of every word, sentence and provision in a licensing or regulating law. To draft, along new lines, a statute dealing with matters of regulation, and to make the same legally sound, is no light task, as many decisions of the courts attest.

UNITED STATES PUBLIC HEALTH SURVEY ON CHRONIC ILLNESSES IS STARTED IN CALIFORNIA

Last Congress Authorized a Survey on Chronic Illnesses.—By action of the last Congress, the United States Public Health Service was instructed to make a survey of chronic illnesses, of sufficient scope to present a fair cross-section of the Union. The work will be in charge of Assistant Surgeon-General L. R. Thompson, who will be assisted by area and state directors, and local chiefs of surveys. The plan contemplates interviews with some 750,000 families who are residents of nineteen states. In California about 46,000 families are to be contacted and reported upon, and the following communities have been selected as representative of the State:

---

* Deputy Browne's communication is printed in the Letters department on page 67.

Bakersfield	6,500
Chico	2,000
Grass Valley	3,800
Jackson	2,000
Los Angeles	20,000
Napa	1,600
Oakland	7,500
Vallejo	3,500

* * *

Thirty Thousand Field Representatives Will Engage in This National Survey.—In Los Angeles, the sections in which the 20,000 families are to be interviewed were selected by the Federal Census Bureau. The entire survey, it is hoped, will provide employment to 30,000 workers; and to thoroughly accomplish the investigation in Los Angeles, no less than 131 of such field representatives are to work under a local chief. The director for California is Dr. Arthur Hieronymous, former health officer of Oakland.†

* * *

Scope of This National Survey.—A letter received from Mr. J. M. Sharp, who is connected with the Los Angeles office, quotes from an address by Senior Surgeon R. R. Spencer of the Federal Public Health Service, in which the objects of the extensive survey are thus summarized:

> By means of this survey, it is now proposed to study the prevalence, distribution, and causes of the disabling chronic degenerative illnesses which may occur at any period of life and which we believe are far more intimately associated with occupation, with economic and social conditions than the acute infections.
>
> The five chief phases of this survey are:
>
> 1. The extent of disability from, and the nature of chronic diseases and physical defects and impairments.
>
> Aside from the data obtained on members of the household as a population base for determination of rates, the aim will be to secure primarily a record of all illnesses keeping persons from work or from usual activities on the day of the enumerator's visit. All such illnesses during the preceding twelve months, if they caused inability to work or pursue usual activities for seven consecutive days or longer; specified chronic diseases, including orthopedic conditions, and the extent and kind of medical care received for each case.
>
> In all cases attended by a physician, it is planned to communicate with the physician and obtain from him a statement of the diagnosis of the ailment present and perhaps some additional information as to its severity. It is the aim to secure similar information from hospitals.‡
>
> 2. Inventory of public health and medical facilities. Information is not now available to give a composite picture of the public health facilities in various public health jurisdictions of the United States. Neither is it possible to show the geographic distribution of agencies of different types nor the extent to which programs of different kinds have been developed.
>
> 3. The extent to which health and medical facilities are used in different types of communities, in different income groups, and by persons suffering from various kinds of chronic disease.
>
> 4. Sickness and mortality rates according to occupation will be obtained from the records of industrial sick-benefit funds. Sickness and death rates will be computed for each numerically important disease or disease group, thus affording information concerning the type of illness to which specific working conditions may predispose.
>
> 5. The incidence of the communicable diseases, the frequency of vaccinations and immunizations, and the completeness of reports to health departments.

LOS ANGELES COUNTY MEDICAL ASSOCIATION HEADQUARTERS BUILDING: NUCLEUS OF A NEW MEDICAL CENTER

New Home of Los Angeles County Medical Association.—The story of the new headquarters and library building of the Los Angeles County Medical Association, opened to its members on October 25, 1934, was told in part on page 376 of the December, 1934, issue of California and Western Medicine, and reads almost like a romance. In the short space of a year, the value of these accommodations has been abundantly proved, and the hospitality of the Association's new home appreciated by many members of both the California and other state associations. Reference is again made to the structure, not only because its existence should be an inspiration to other county and state medical societies to make similar efforts to have homes of their own, but because in this issue is reprinted an article from the Los Angeles *Times*, describing a proposed addition to one of the major medical buildings located in the immediate vicinity of the county society headquarters, whose grouping around the county unit's building has already created a real medical center for the City of Los Angeles.

* * *

Income Return on Lot Leased to Wilshire Medical Building.—The structure to which reference is made is the Wilshire Medical Building,* which in some respects is in a class by itself, as far as our knowledge goes, of buildings erected for the exclusive use of physicians, dentists and their accessory affiliations.

The property on which the first unit of the Wilshire Medical Building was erected is owned by the Los Angeles County Medical Association, that component county society having leased the lot to the Wilshire Building holding company for a term of ninety-nine years, receiving for its use at the present time, an annual rental of $11,500, this rental to increase to a minimum of $15,000 per year when the mortgage on the Wilshire Medical Building has been retired. The county society may later receive a certain additional percentage on the gross income of the property, so that the annual rental in time may be brought up to, perhaps, $20,000—the lease provisions including, in its gross, not only the income received from the improvements erected on the original county society lot, but on structures built on property subsequently purchased by the Wilshire Building holding corporation. From an initial outlay, made only a few years ago, of less than ten thousand dollars for the purchase of the original lot, these beneficent financial results—which have helped to make possible the erection and maintenance of the new home and library of the Los Angeles County Medical Association—are certainly most gratifying.

---

† Office address of Dr. A. Hieronymous is 534 Hobart Street, Oakland.

‡ The editor was told by Dr. Arthur Hieronymous that the Federal Government would pay twenty-five cents for each physician's report.

* For description of a new addition to the Wilshire Medical Building, see page 70.

Interesting Facts Concerning the Wilshire Medical Building.—And here it may not be out of place to call attention also to the following facts concerning the Wilshire Medical Building:

1. The original unit, erected in 1928, at a cost of $1,000,000 is almost entirely owned by members of the Los Angeles County Medical Association.

2. It was financed without discounts or commissions, practically all stocks and bonds sold being applied to construction.

3. All tenants in the building, with the exception of a small number of dentists, are members of the Los Angeles County Medical Association.

4. During the recent years of depression, the building has been rented up to 95 to 98 per cent of its capacity, and now it has a waiting list.

5. Its board of directors (Doctors Wayland Morrison, president; Edward M. Pallette, vice-president; Herman Zeiler, secretary-treasurer; Clarence Toland, William H. Kiger, Ernest C. Fishbaugh and Francis L. Anton, directors) are all members of the Los Angeles County Medical Association.

* * *

In These Investments, Physicians Were Good Business Men.—The statement so often made, that physicians know nothing of business, evidently does not apply to the enterprise here referred to; which, happily, because of its own good fiscal and administrative record, makes the outlook for continued financial returns to the Los Angeles County Medical Association almost certain. Both organizations are to be congratulated on the happy results already attained, and likely to be realized in the future.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 52.

EDITORIAL COMMENT†

ON SUGAR AND FRUIT JUICES BEFORE OPERATION UNDER A MAJOR ANESTHETIC

Since Doctor Sansum, some sixteen years ago, suggested to us that, in addition to our use of large amounts of sugar and fruit juices before operation under a major anesthetic, we follow the operation with 1,000 cubic centimeters of a 10 per cent glucose solution to prevent or lessen postoperative vomiting, we promptly began the use of intravenous glucose solution for this purpose, and recognized at once its great value as a food when nothing could be given by mouth to patients suffering from general peritonitis.

At that time, without being able specifically to follow up patients with so-called acidosis, we made the simple test of the urine for diacetic and acetone, and whenever these were found to be present the patient was given glucose intravenously. Not long thereafter we recognized the fact that considerable sugar was lost in the urine, and we then gave insulin.

In discussing this with Professor Chauncey D. Leake of the University of California, he submitted the following:

> "One unit of insulin will take care of approximately one and one-half grams of glucose. It seems only reasonable to administer insulin with glucose in connection with operative procedures, in order to assure the proper utilization of the glucose administered. The purpose of giving the glucose is to provide a ready source of energy. This will not occur unless the glucose is adequately metabolized. In an operative procedure the tendency of the anesthetic agent is to interfere with enzyme action generally, and there is specific evidence, as brought out years ago by Thalimer, that insulin secretion is diminished by anesthesia. In order, therefore, to utilize the glucose administered, insulin should be given with it."

Many men have made these observations and most of them have put their ideas in print, and no doubt all of us know these facts; but one seems to forget too easily, and therefore we should be excused for reminding the profession, from time to time, of these aids to the successful care of their patients.

HYPERPYREXIA FOLLOWING THE USE OF ATROPIN IN THE EYES OF CHILDREN

Many physicians appear to be unfamiliar with the occurrence of hyperpyrexia following the use of atropin, and are liable to be misled by it.

The increased use of atropin in the so-called true colic of infancy, gastrospastic or entrospastic infants, require large doses, usually enough to produce a flush. The amount of atropin required for gastro-intestinal relaxation varies enormously, as it does in the time and extent of pupillary dilation. Whether a given patient will have fever with the other manifestations is impossible to predict; but when it does occur, it is usually in the patient's home and requires careful explaining, and may lead to much unforeseen difficulty.

The problem is further complicated by the leukocytosis which not infrequently follows these administrations of atropin.

The length of time also varies; but the fever usually starts in three to four hours after the oral administration, with its peak in six to eight hours, and rapidly disappears.

The flushing provoked need not be disconcerting, because the strong vasomotor reaction of atropin is constant in healthy individuals and seems to be a compensating phenomenon to counteract the temperature raising action of the drug.

---

* This department of California and Western Medicine presents editorial comment by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California and Nevada Medical Associations to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

Infants and young children have a remarkable tolerance to atropin, in spite of the occasional striking by-effects. In large doses, or in sensitive individuals, it causes systemic poisoning, headache, dryness of mouth, palpitation, and hyperpyrexia. The hyperthermia is attributed to the muscular excitement and the suppression of diaphoresis, but this has not been clearly established.

An explanation may lie in the fact that the solutions of atropin used vary so widely. U. S. P. atropin sulphate is an intimate mechanical mixture of D and L hyoscyamins. The purest atropin is supposed to have the two constituents in equal quantities. However, L-rotatory hyoscyamus is from twelve to forty times more powerful than the dextro-rotatory, and also correspondingly more toxic. The reaction of atropin rests in the ratio of the D. and L. constituents.

The usual procedure is to instil one drop of a one per cent or one-half of one per cent solution every ten minutes until three instillations have been made, and followed by the refraction in not less than an hour.

1 drop of one-half of 1 per cent = .0032 or 1/20 gr.
1 drop of 1 per cent = .0065 or 1/10 gr.
3 drops of one-half of 1 per cent = .0097 or 1/6 gr.
3 drops of 1 per cent = .0195 or 1/4 gr.

Since 1928 I have seen six cases of hyperpyrexia following atropin as a cyclopegic, and when we consider that the adult dose is 1/150 of a grain, it is very surprising to me that we do not see this action more often following instillations of relatively high doses.

The important feature is for the clinician to realize, as he does in the case of mouth-parching and mydriatic propensities, that the atropin alkaloid group may give occasion for unexpected irregularities of temperature in his youthful patients.

FRACTURE OF THE NECK OF THE FEMUR: SIGNIFICANT ADVANCES IN TREATMENT

Intracapsular fracture of the neck of the femur has brought despair to doctors, distress to faithful nurses, crippling to many a younger victim, and death by slow torture to the aged and feeble. Bunnell,[1] in the July issue of California and Western Medicine, has given an able discussion of many of the details of this problem. It appears that, given accurate reduction and adequate fixation by a method which does not overtax the patient's strength, union of this fracture may be as confidently anticipated as that of other severe fractures in a patient possessing a similar recuperative capacity.

Leadbetter[2] has demonstrated an effective method of reduction. The addition of the lateral x-ray provides a sure means of checking reduction. Powerful portable units take x-rays in the operating room. Skin-clips, fixed before taking x-rays to check reduction and left *in situ* during operation, seem a more practicable means of localizing the fracture than specially devised instruments for steering the nail.

Utilizing the above facilitating measures, secure internal fixation of the fracture by steel nails may now be accomplished, with a minimum of shock, under local anesthesia.

Fixation by autogenous bone-peg requires so extensive an operation that it is expedient only in carefully selected cases. Rarely, if ever, is such fixation secure enough to make postoperative immobilization by cast or splint safely avoidable. Cross-pegging weakens the main graft materially.

Multiple small steel nails, toed in and impacted, accomplish such secure fixation that postoperative casts, splints, traction or sand bags are unnecessary. Immediate freedom of motion in bed may be permitted, and very early ambulation (without weight bearing) is safe. Suffering is greatly reduced. The danger of hypostasis and of decubiti is minimized.

As a device for internal fixation the flanged nail of Smith-Peterson, itself a good instrument, must, in the opinion of the writer, give way to the surer and more effective small steel nails toed in in a set of three. Moore's[3] method of multiple nail fixation has several distinct advantages over that used by Telson and Ransohoff.[4] Moore inserts his nails with the fingers, using a small-handled chuck. This permits the surgeon to feel the difference in resistance offered to the advancing nail by soft tissue, cancellous bone or cortex. (The writer has verified this in his own experience.) The surgeon is thus enabled to feel the nail go through the cancellous portion of the head, and drive it firmly into the cortex. The adjustable threaded head on the nail used by Moore permits effective impaction, a very significant detail. The expedient of wiring the triad of nail heads together insures against a nail working out.

Because this fracture occurs most frequently in those who are about to die of old age and its weaknesses, the morbidity and mortality will always be high. How distressing it has been to see so many pass their last days in the torment that so often unavoidably accompanies the so-called conservative methods of treatment. Nor has the doctrine of *laissez faire* given much peace to the surgeon or comfort to the patient.

Therefore, we hail the advent of a positive method which gives comparative comfort temporarily, together with the best hope of ultimate recovery. Let us not, however, forget that this method increases the exactions on both the skill and the armamentarium of the surgeon.

HOW CORRECT IS THE ANSWER?

Modern medicine leans heavily upon the laboratory and other scientific aids in solving its diagnostic problems. As our knowledge becomes more exact and our concepts broaden, we call upon the laboratory for more tests to confirm clinical findings or measure impairment of function. And almost yearly the laboratory offers new aids to assist the clinician in arriving at a correct diagnosis of his patient's illness. Of the questions which the clinician puts to the laboratory, only a few can be answered by "yes" or "no," and these mostly in the field of bacteriology. Even a Wassermann report is qualified as to the degree of its positiveness.

The Normal Range.—In all instances where the laboratory is requested to measure a function of the human body the report must be in quantitative terms—in a numerical figure. This implies a normal standard with which the value reported for the patient must be compared. It is then necessary for the attending physician to decide if there is significant deviation from the normal. Some laboratories now print upon their report-forms the normal values, or range of normal for the various functions, as white blood count, blood sugar, etc. This is intended to be helpful, but carries the inference that physicians do not already know what the normal is. There is also the implication that any and every deviation from the normal given is evidence of a pathologic state. This, obviously, is not true.

Reflection upon these matters should warn us that, in resorting to scientific aids in diagnosis, there is danger that medicine will become too mathematical, and that the equally valuable art of medicine, centuries older than its science, will suffer a regrettable eclipse. I do not mean to disparage the contribution of mathematics to medicine, because it is true that all modern advance in medicine has come through scientific discoveries, and mathematics is the basis of science. The danger lies in the connotation which figures carry. The measure of any physiologic function, such as blood pressure, when set down as a numerical value carries an implication of accuracy and finality which it does not possess. This implication, and connotation, carried by figures is not inherent in them, but results from an inadequate training in the scientific use of figures. Figures are not the end, but only the means to an end. The obese patient who reduces his weight from 200 to 175 pounds may regard 175 pounds as the goal to be attained, but his wise physician knows that the aim attained is better health and a longer life for the patient.

It sometimes happens that fundamental research discovers a method of measuring some physical function, and the procedure is adopted into clinical medicine before the extreme limits of normal are known. Usually the range of normal widens as the number of clinical observations grows and our experience in measuring the function increases. In time the test attains its proper valuation and use in clinical medicine; or, if found valueless, it falls into disuse. Occasionally, it is well to remind ourselves that the hasty and uncritical adoption of new tests will lead to diagnostic errors.

Error of the Method.—A quantitative value in medicine is, after all, only an estimate and not an exact measurement, because there is a certain unavoidable error in every laboratory or clinical examination involving mensuration. The magnitude of the error may be inconsequential; as, for example, the error of 5 to 10 per cent which may be present in recording the pulse when its rate is counted for only fifteen seconds. But in other instances the error may be of such magnitude as to render very questionable the significance of a slight deviation from the accepted normal. Therefore, in addition to recording the maximum range of normal, all laboratory reports should give the error in the method used. It is necessary that the physician know the reliability of the method employed in obtaining the information he seeks.

Every physician who has made blood counts knows the possibilities for error. Usually he thinks of them in terms of his own technique, *i. e.,* correct proportions of blood and diluting fluid. He may wonder if his sampling is good, if the drop of blood obtained is a perfect sample of his patient's blood. Perhaps, in order to secure enough blood, the ear or finger was squeezed, thus disturbing the normal proportions of serum and cells in the sample. But aside from all these types of error there are others inherent in the method which seldom, if ever, occur to him. He may realize that there is a certain error if he counts only one hundred cells, and so he seeks to reduce it by counting two hundred cells, thinking he has halved the error. But it is necessary to count four hundred cells in order to reduce the error one-half. Then if he does a differential count, how many cells should he count? What is the error in a differential count of one hundred cells? If the polymorphonuclear leukocytes increase from 70 to 80 per cent in two hours, does it mean appendectomy is necessary, or is this a chance difference due to technique, or to the number of cells counted, or to error inherent in the method?

And so forth through the list of quantitative measurements. The blind faith of the uncritical in the significance of small differences obtained in estimating body functions is beautiful to behold, but not conducive to good diagnosis. Neither is too much reliance upon the laboratory to be lauded when advising therapy. A basal metabolism report of "plus 14 per cent" does not call for measures directed toward hyperthyroidism, even if the accepted upper limit of normal is "plus 10 per cent." There is an error of 5 per cent inherent in the method, and the report should have been rendered "between plus 9 and plus 19 per cent." Then the attending physician must decide whether or not the patient is thyrotoxic. The laboratory cannot, and should not, make diagnoses. It can only make reports which the physician correlates with all the other findings in order to arrive at a diagnosis.

THE SURGICAL TREATMENT OF LESIONS OF THE STOMACH AND DUODENUM*

By E. Starr Judd, M.D.†
Rochester, Minnesota

Gastric and Duodenal Ulcer.—A clear-cut distinction between gastric and duodenal ulcer was not made until late in the twentieth century, although reports in the literature indicate that gastric ulcer was recognized as early as 1600, and that two cases of duodenal ulcer were recorded in 1817. Evidently many of the diseases that constitute the problems of today were known to the men of ancient times. The magnitude of the problem of peptic ulcer alone may be calculated to some extent by the fact that in a period of twenty-six years we found it necessary at The Mayo Clinic to operate on about 3,000 patients for gastric ulcer, and in a period of twenty-eight years almost 13,000 patients underwent operation for duodenal ulcer. These figures, obviously, do not take into account those persons who harbored healed duodenal ulcer, those whose symptoms were controlled by dietary measures, or those who had such slight digestive disturbance that they preferred to tolerate the distress rather than to submit to any inconvenience that might result from adoption of a dietary regimen.

PATHOGENESIS OF GASTRIC AND DUODENAL ULCERS

The causes of gastric ulcer and of duodenal ulcer undoubtedly are somewhat allied. The fact that stands out as a dividing line is the extreme rarity of malignancy in the duodenum, and the relative frequency of lesions of that nature in the stomach. In the few cases of primary malignancy of the duodenum that have been reported, it has been difficult to prove that the disease has been a sequel of chronic duodenal ulcer. Experience with lesions of the stomach indicates that there must be some association between chronic gastric ulcer and certain forms of malignancy found in the stomach. Often it is impossible to distinguish between carcinomatous gastric ulcer and ulcerating carcinoma until microscopic study of the tissue is made. In about 19 per cent of the cases of gastric ulcer, the lesion was malignant. According to the experience of some pathologists, a gastric ulcer 2.5 centimeters or more in diameter is likely to have undergone malignant change. It might further be stated that the presence of carcinoma in lesions less than one centimeter in diameter has been demonstrated sufficiently often to preclude dismissing the possibility of carcinoma being present in small gastric ulcers. In specific instances there is much to suggest that the malignant process is the sequel of a chronic gastric ulcer.

It is logical to think that a better understanding of the whole situation should be gained through experimental work with animals, but the work has been impeded by the fact that benign ulcer of the stomach and of the duodenum are peculiar to man. It has never been difficult to produce an acute ulcer of the stomach experimentally, but only in recent times has it been possible to cause chronic ulcer at will, as has been accomplished by Mann, Dragstedt, and others. Matthews and Dragstedt concluded that the chemical action of pepsin-hydrochloric acid is the outstanding factor in the production of acute, and subsequently of chronic, ulcer; although gastric motility, trauma to the mucosa, and general systemic conditions help to promote progress of the process. Heredity may also play an important part in the development of ulcer. Perhaps, in some instances, infection of toxins exert considerable influence. Wilkie, after observation and study, expressed the belief that too much emphasis cannot be placed on irregular habits of living as a causative element. According to our experience at the clinic, only in a few cases can gastric ulcer definitely be traced to ingestion of ordinary chemicals. However, in a series of experiments carried out in an attempt to reproduce the changes in the liver which result from use of cinchophen, Bollman found that gastric ulcer developed in some of the dogs after the use of the drug.

Knowledge of the pathogenesis of ulcer does not progress rapidly, in spite of the vast amount of effort to solve the problem. In accordance with present knowledge, the logical treatment of peptic ulcer, whether medical or surgical, must be directed toward correction of the known etiologic factors.

TREATMENT

As soon as gastric and duodenal ulcer were thought of as distinct entities, and the possibility of malignant change in association with gastric ulcer was recognized, treatment of the two conditions took diverse paths. Up to this time no clinical or roentgenographic criteria have been found which will allow determination of whether or not there is a malignant lesion in the border of a chronic gastric ulcer; and so it is evident that the lesions must be removed before their exact nature can be determined.

In a few cases in which there is reason to believe that a gastric lesion is benign, there might be justification for trying medical and dietary management, provided that the patient can be kept under close observation. However, anyone who advises adoption of this plan should keep the possibility of malignant transformation foremost in his mind, and should be sure that later he can obtain the patient's prompt and willing acceptance of an operation, in the event experience indicates that this is the outstanding requirement. The immediate operative mortality rate among patients who have benign gastric ulcer is about half that encountered among patients whose lesions have undergone malignant change. Another interesting observation is that jejunal ulcer is relatively uncommon following surgical procedures employed for removal of gastric ulcer (twenty in a series of 597 cases of proved jejunal ulcer). The more the situation is studied, the more is the observer impressed with the fact that an ulcer of the stomach imposes a problem very different from that of an ulcer of the duodenum, from the experimental standpoint as well as from the clinical and surgical aspects.

---

* Read before the General Surgery Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13 to 16, 1935.

† Dr. E. Starr Judd died on November 29, 1935. See obituary in *Journal of the American Medical Association*, Vol. 105, No. 23, page 1930, December 7, 1935.

Formerly, in a large proportion of cases, treatment consisted of gastrojejunostomy for either gastric or duodenal ulcer. It proved a suitable procedure in many instances because the disease had been allowed to progress to an advanced stage, but, with improvements in both diagnostic and operative technique, and with opportunity for earlier diagnosis, local excision plus gastrojejunostomy have proved to be a satisfactory method of treatment, for gastric ulcer. Approximately 90 per cent of these lesions are situated along the lesser curvature. Eighty per cent of these ulcers are small, and are probably best treated by the method just described. In some instances, resection would be easier from a technical standpoint; but if the ulcer is of moderate size, excision and gastrojejunostomy will give a very satisfactory functional result. In other cases the technical procedure will be simplified by taking out the pyloric end of the stomach with the ulcer.

For a number of years the policy at the clinic has been to recommend surgical treatment to practically all patients with gastric ulcer; but it should be stated that when we carry out the operation, we favor a conservative procedure. Local excision was all that was deemed advisable in 222 instances; although in twenty-nine, malignant change was found in the ulcer at the time of operation. Gastrojejunostomy or gastroduodenostomy was employed in addition to local excision of the lesion in 888 cases of benign ulcer, and in forty-three cases of malignant ulcer. It is not always possible to follow a conservative plan of treatment on account of the large size of the lesion, the depth of the crater, or the extensive induration; consequently one of the more radical plans of partial gastrectomy was deemed advisable in 1092 of these cases. Furthermore, approximately 6 per cent of patients who have gastric ulcer will have multiple lesions which will require partial gastric resection. If the lesion is situated in the midgastric region, segmental resection occasionally is indicated.

In most cases of uncomplicated duodenal ulcer, medical management should be given a trial, and if it is inadequate, a surgical procedure should be undertaken. This is especially true of that unfortunate group of ulcer-bearing individuals who have the extremely high-strung nervous temperament which often accompanies a strong predisposition to ulcer. Since October, 1934, Rivers has used duodenal extract as a supplement to a regulated dietary regimen in more than fifty cases of clinical ulcer, gastritis, and jejunitis. This plan has given much promise, especially in instances in which there was no roentgenographic evidence of a crater. The excellent results which have seemed to come from the supplementary use of duodenal extract are impressive. Complete remission of symptoms has followed employment of 60 to 80 grams of the extract for periods varying from eight days to four weeks. However, sufficient time has not elapsed to justify the belief that the results will be permanent.

There are always some exceptions that must be made, and it is probable that there will be some uncomplicated cases of duodenal ulcer in which experience will indicate that there is nothing to be gained by continuing unsatisfactory medical treatment and delaying operation. However, when operation is employed, the procedure should be as conservative as the situation will permit. The requirements of such an operation include (1) minimal risk, (2) a reasonable chance for complete cure, and (3) ample provision for further operation should conditions require it. Adherence to such a plan is equally necessary in cases in which an operation is imperative on account of hemorrhage, obstruction, or perforation. Under these circumstances, temporizing beyond the point of opportune preparation of the patient only increases the risk.

Two procedures now are available which remove more of the recognized etiologic factors than any of the other operations for duodenal ulcer: (1) lateral anastomosis between the stomach and the first portion of the duodenum, and (2) excision of the cap of the duodenum with the lesion and the anterior two-thirds of the pyloric sphincter muscle, with closure as a gastroduodenostomy. These operations have a better physiologic basis, and are more practical than any anastomosis between the stomach and jejunum, which always provides an opportunity for the subsequent serious complication of jejunal ulcer. Furthermore, there is wider distribution of the food stream, and reduction of physical trauma. In addition, use of either of these procedures permits the acid content of the stomach to empty into the most alkaline portion of the duodenum, which is best fitted to care for this acid material. These two operations should be employed more often than they are.

Acute hemorrhage from a gastric or a duodenal ulcer rarely requires immediate operation, for the hemorrhage is not likely to be fatal, and the operative mortality is likely to be higher than if medical management is provided until the patient's general condition improves. Furthermore, it may not be possible to find the bleeding point if it is small or situated in a region of inflammation, without true ulceration. Of course, acute perforation of a gastric or duodenal ulcer necessitates emergency surgical treatment to save the life of the patient. If the ulcer is of the protected, penetrating type, careful medical supervision may reduce the acute reaction about the lesion, and may permit the operation to be carried out with less risk at a future time.

In selected cases, gastrojejunostomy continues to be a useful operation for treatment of duodenal ulcer. It is particularly satisfactory for older patients, and especially for those who have had symptoms of obstruction. At present, among the clientele of most surgeons in this country, there seems to be no good reason for radical resection of the stomach in cases of duodenal ulcer.

Table 1.—*Percentage of Various Operations for Duodenal Ulcer Employed in Different Periods*

Operations	1906 to 1926		1926 to 1933	
	Cases	Per Cent	Cases	Per Cent
Gastrojejunostomy	7,741	86.08	2,673	69.07
Local excision of the lesion	1,113	12.38*	1,014	26.20†
Resection	131	1.45	171	4.42
Pyloric exclusion	8	.09	12	.31
Cases	8,993		3,870	

* In 301 of these cases gastrojejunostomy also was performed.

† In 59 of these cases gastrojejunostomy also was performed.

The trend of selection of operations for duodenal ulcer in the clinic is well illustrated by study of the operations used in the past twenty-eight years (Table 1). Pyloroplasty has afforded very satisfactory results, and its use has been increased 100 per cent in the past ten years; study of 930 cases reveals the operative mortality to be less than one per cent. Lateral gastroduodenostomy also has gained in acceptance, for very few patients who are subjected to this operation require further attention. Resection of the stomach is employed in less than 5 per cent of cases of duodenal ulcer.

A few patients who receive surgical treatment for benign lesions of the stomach or the duodenum do not obtain complete relief, although evidence of recurrence of the original disease cannot be found. Some of these patients have persisting dyspepsia, which may be caused by some unrecognized intra-abdominal disease. In other instances, the symptoms are really insignificant and frequently can be relieved by a change in mode of living, correction of diet, and elimination of foci of infection. In some instances, a jejunal ulcer will form after establishment of anastomosis between stomach and jejunum, even though the operation was judiciously employed and skillfully performed; if further operation is required, establishment of a more nearly normal physiologic relationship of parts of the alimentary tract is indicated.

CARCINOMA OF THE STOMACH

In carcinoma of the stomach there is a place for conservative as well as for radical treatment, for in a few instances the malignant lesion is of such a character that local excision seems justifiable. This is true especially when the neoplasm appears to be in an incipient stage, small, well localized, and in such a position that a more radical operation would be exceedingly hazardous. The results seem to justify continued employment of this form of treatment. The percentage of cures persisting throughout five, ten, fifteen, and twenty years after operation is even higher than that following gastric resection; but this is not inconsistent, for undoubtedly the majority of the lesions treated by conservative operation were discovered while they were in the stage most amenable to treatment. It must also be remembered, however, that the results would be even better if cases were eliminated in which resection was impossible because of inaccessibility of the tumor.

In the more advanced cases of carcinoma of the stomach, including cases of linitis plastica, radical surgical removal of the growth offers the only hope of cure. Consequently, we advocate exploration in all cases unless irremovable metastatic lesions are known to exist. In general, the presence of implants on the rectal shelf, and demonstrable metastasis in the cervical lymph nodes or in the lymphatic structures about the umbilicus, are contraindications to operation. Although roentgenologic examination is of great aid in the diagnosis of carcinoma of the stomach, it cannot be relied on for determination of operability or inoperability in all cases. Even when the abdomen is open, the lesion may appear to be irremovable because of its attachment to the colon or pancreas; but after inflammatory adhesions have been freed, such a growth is often mobilized sufficiently to permit extirpation. Not infrequently, while the surgeon is making exploration in these cases, he observes lymph nodes that appear to be involved, and often they are in a position which precludes carrying out excision with a reasonable degree of safety. Such lymphatic structures, or even a distant nodular growth in the liver, may be of an inflammatory nature. Therefore, the presence of a nodule of indeterminate nature should not contraindicate removal of the primary growth if this can be accomplished satisfactorily. Furthermore, experience often has shown that after removal of the primary cancer the metastatic lesion may regress or at least remain quiescent for a considerable time.

Total gastrectomy probably could be carried out more often than it is; however, the high mortality, and the doubt as to the effect of loss of the entire stomach on the general physiologic processes, have deterred many men from attempting the operation. Several of the ten patients who underwent this operation at the clinic obtained relief for considerable periods; one of them for as long as four years.

In the majority of instances, some form of partial gastrectomy is the operation of choice. If the neoplasm is small and is situated in the pyloric portion of the stomach, the Billroth I operation may be employed; however, resection according to the Polya technique is applicable in a higher percentage of cases. The latter procedure has several advantages: it allows for removal of an adequate portion of the stomach and for wide dissection of the regional lymph nodes and other involved tissues. Furthermore, if recurrence does take place it usually occurs in the liver or other distant structures, and the patient does not suffer the distressing symptoms attending obstruction caused by recurrence of the growth in the stomach itself. Experience in the clinic, with partial gastric resection for carcinoma, seems to justify an optimistic attitude (Table 2).

Table 2.—*Results of Gastric Resection for Carcinoma*

Period Lived After Operation	Number of Patients	Percentage of Traced Patients
5 years or more	393	25.0
10 years or more	170	16.4
15 years or more	75	13.5
20 years or more	23	9.3

Although patients who have lived five to ten years after operation are justly considered cured, we operated on a patient who had a recurrence of gastric carcinoma twenty-one years after gastric resection. Recurrences have been known to take place after a period of years, but such an experience is the exception and not the rule. Furthermore, patients who live fifteen to twenty or more years after removal of a carcinomatous growth of the stomach usually have enjoyed normal expectancy.

One should not be content to treat only removable lesions, for it is possible to make life more comfortable for many of the more unfortunate individuals who possess lesions that cannot be eradicated satisfactorily. For example, metastasis to the liver of a patient who is in good general condition should not always preclude palliative removal of an ulcerated, infected gastric lesion. Such a procedure not only removes a painful, sloughing growth, but also circumvents an actual or impending obstruction. At times gastrojejunostomy for relief of obstruction is all that can be tolerated by the patient. This operation may be followed by resection of the growth at a later date, or it may constitute a purely palliative measure. It should be pointed out, however, that because of the poor state of nutrition of the gastric wall, healing is impaired and the mortality following gastrojejunostomy is high.

SARCOMA

Sarcoma is a comparatively rare gastric lesion; only seventy-three cases had been encountered at the clinic up to January 1, 1934. The symptoms of the disease are not sufficiently characteristic to allow the condition to be distinguished from carcinoma; consequently, in most instances the preoperative diagnosis is carcinoma. Partial gastrectomy, combined with roentgen therapy, is the only rational treatment if the growth is resectable, because the postoperative average duration of life of patients for whom only exploration was performed was six months. The operative mortality for the whole group was 12 per cent. The patients whose lesions could be removed were divided into two groups: those who had died since the operation and those who were still living. The average duration of life in the former group was eleven months, and in the latter, four years and four months; the longest survival was nine years. Although the results of treatment have not always been as satisfactory as would be desired, the prolongation of life which is brought about in some of the cases justifies the employment of radical resection when this can be accomplished without undue risk.

POLYPOSIS

The diagnosis of polyposis of the stomach is always difficult to make clinically because, when symptoms are produced, they may simulate those of any type of gastric tumor. The polyps may be single or multiple, and if multiple they sometimes involve the entire gastric mucosa. Balfour and Henderson reported a group of fifty-eight cases of benign gastric tumor, and noted that gastric polyp, comprising 20 per cent of the entire series, occurred more frequently than any other type of lesion. The lesions in cases of multiple gastric polyp are rarely malignant, whereas single polyps frequently undergo malignant transformation. In our experience, 50 to 60 per cent of single gastric polyps develop malignant characteristics; consequently, wide excision of the stomach adjacent to the tumor is the preferable procedure to carry out in their treatment. If the polyps are situated in the lower end of the stomach, resection of the Billroth I or the Polya type may be employed. However, in those instances in which the lesions are situated high on the posterior wall, or in the fundus, segmental resection of the stomach, or transgastric excision, often is all that can be accomplished.

SYPHILIS OF THE STOMACH

Gastric syphilis is not as rare as it has been thought to be. The reason for this is that the symptoms are easily confused with those of chronic ulcer, carcinoma, and hour-glass contracture of the stomach. Consequently, the diagnosis is usually made late in the course of the disease, unless phenomena of obstruction develop as a result of narrowing of the pyloric outlet. However, even when retention is present in cases in which syphilis is suspected, surgical treatment should be deferred until there is proof that adequate antisyphilitic treatment will not relieve the condition that is causing the obstruction. Young individuals usually respond to this therapy. In treatment of elderly patients, temporizing is not justifiable if the lesion is resectable, and especially if the symptoms are of recent origin, if there is a palpable mass in the epigastrium, if pus and blood are found in the stomach, and if there is occult blood in the stool. Even if an error has been made in the diagnosis, the surgeon who operated has acted wisely. Surgical treatment is clearly indicated in the presence of hour-glass contracture of the stomach; for the deformity once established is not only permanent, but probably will increase from further contracture of scar tissue.

TUBERCULOSIS OF THE STOMACH

Gastric tuberculosis is rare. In study of gastric material obtained at operation and at necropsy, the incidence among patients at the clinic has been only 0.34 per cent. The diagnosis is difficult to make because of the ease with which the disease may be confused with gastric ulcer and carcinoma. The gross appearance of the lesion may be that of an ulcer, a tumor, or diffuse scarring of the stomach. Radical resection of the involved portion of the stomach is the treatment that affords relief. Since the requirements are surgical, inability to arrive at an accurate differential clinical diagnosis is not likely to be as disastrous as it might be under some other conditions.

SUMMARY

Careful preoperative preparation has reduced the mortality of surgical procedures applicable to the upper part of the gastro-intestinal tract, and as a consequence of a supervised regimen after operation, better end-results have been obtained.

Satisfactory methods of solving many of the problems imposed by the presence of lesions in the stomach and duodenum now are available. Marked progress toward more complete mastery of the situations undoubtedly will be delayed until more is learned about the etiology and pathogenesis of the lesions and about the chemistry of the body.

Mayo Clinic.

ON THE SURGERY OF GLAUCOMA: MODE OF ACTION OF CYCLODIALYSIS*

By Otto Barkan, M.D.
S. F. Boyle, M.D.
and
S. Maisler, M.D.
San Francisco

Discussion *by A. C. Macleish, M.D., Los Angeles; Melverton E. Trainor, M.D., Los Angeles; A. Ray Irvine, M.D., Los Angeles.*

The observation, by E. Fuchs,[1] of hypotony, associated with choroidal detachment following cataract extraction, suggested to Heine[2] the thought of similarly softening the glaucomatous eye by establishing a communication between the anterior chamber and the suprachoroidal space through surgical means. He was encouraged in his idea by the knowledge, as shown by anatomical specimens, that in absolute glaucoma, with complete obliteration of the filtration angle, the suprachoroidal space remains patent for a long time, perhaps permanently so. He hoped that as in traumatic iridodialysis, the ciliary body or iris root usually shows no tendency to heal on again, the surgically detached ciliary body would also remain detached during the healing process, and that thus a permanent communication between the anterior chamber and the suprachoroidal space would be established, or that with the help of a myotic, at least a capillary cleft would remain, which would be sufficient to permit of outflow of aqueous into the suprachoroidal space.

HEINE'S INTERPRETATIONS

Heine's original idea has been supported by several facts. Thus in some cases after cyclodialysis, a flat peripheral choroidal detachment has been observed with the ophthalmoscope. It seemed questionable to him, however, whether the permanency of its action could be explained in this way. In those cases which have come to anatomical examination, because of the failure of control of tension, a reattachment of the iris root is, of course, found. But what of the many successful cases which constitute the majority? One such case has been examined anatomically, that of Elschnig.[3] Histological examination of the eye, the tension of which had been permanently normalized by cyclodialysis fourteen years previously, showed a free angle, patent Schlemm's canal and a communicating cleft between the anterior chamber and the suprachoroidal space within the area of operation. On the opposite, nonoperated side the angle was closed and Schlemm's canal mostly obliterated. Elschnig believes the formation of the cleft to have been the major agent in reducing the tension of this case. He does not, however, exclude reduced production of aqueous resulting from damage to the ciliary body as a possible factor, nor does he believe the freeing of the angle to have been a factor because the pectinate ligament (corneoscleral trabeculum) within this region appeared so sclerosed and compressed as to probably render filtration impossible. This case then shows that the success of the operation *may* depend upon a communication between the anterior chamber and the suprachoroidal space.

VIEWS OF OTHER AUTHORS

Some authors believe that the improved circulation within the iris vessels—these vessels had been bent at right angles by the peripheral iris adhesions and are straightened out by the operation—affords the opportunity for increased absorption of aqueous. Filtration through the scleral scar does not come into question. Others suggest that restitution of the filtration angle, by separation of the peripheral iris adhesions from the angle wall, or scraping off the pathological endothelium in the angle with secondary regeneration when the ciliary body heals on again, are factors. Heine feels this a possibility, but remarks that it would be a difficult thing to show anatomically and to disprove the presence of a capillary cleft in the region of the cyclodialysis.

We, therefore, do not yet possess a histological explanation of the action of cyclodialysis and must as yet content ourselves with the discussion of theories such as the ones mentioned above which deal with the reëstablishment of normal absorption or outflow. Other theories deal with the thought of reduced formation of aqueous through atrophy of the ciliary body following section of its nerves and vessels of supply (R. Salus,[4] Kraus[5] and Meller.[6]) According to E. Bunge,[7] such a partial atrophy of the ciliary body, which already shows some general atrophy due to the glaucomatous process, has not been accepted as proven.

MODE OF ACTION OF CYCLODIALYSIS STILL REMAINS AN OPEN QUESTION

The mode of action of cyclodialysis remains, therefore, an open question to date. The importance of arriving at the true explanation of the action of the operation is evident. Our surgical

technique, as well as indications for operation and choice of case, would probably be materially influenced and improved by the knowledge of what we are trying and are able to achieve.

It was with this purpose in mind that we examined the angle of the anterior chamber of a series of cyclodialized eyes with the Koeppe contact glass, Vogt's carbon slit lamp and the binocular corneal microscope. The method which we have devised will be published in the near future. For the present, let it suffice to state that with this technique a truly beautiful picture of over forty magnifications of the whole circumference of the angle and its constituent parts can be obtained such as has not been afforded by any of the gonioscopic methods used up to the present time.

AUTHORS' ANALYSIS OF CASES

We have examined to date fourteen of our cyclodialysis operations with this method. Of eleven cases in which the operation successfully normalized the tension, all show a detached iris root and a cleft between the iris root and the scleral wall through which aperture one can see the scleral wall and can sometimes look into a cavern extending 6 millimeters or more into the depth posterior to the scleral spur. The further reaches of this apparently bottomless pit are lost from view. Fig. 1 is an example of such a case. This, as well as the other figures, gives a diagrammatic composite view of what is seen in different lines of regard. Fig. 1 illustrates the case of Mr. L., age sixty-two, chronic simple glaucoma, with a tension of fifty-eight, McLean, while under the influence of three hourly instillations of pilocarpin 2 per cent. Cyclodialysis (down and out) performed three years ago had normalized tension (under thirty, McLean) to date. The operation formed the cleft (at five) and, as is usually the case, some traumatic peripheral iris adhesions (at four) to either side of the cleft. The angle is open throughout the rest of the circumference.

Of the fourteen eyes examined, all of the successful cases show this characteristic picture of a surgical cyclodialysis, or detachment of the iris root along with a communication between the anterior chamber and the suprachoroidal space. The three unsuccessful cases on the contrary all show a reattachment of the iris root to the scleral wall. Upon reoperating one of these with formation of a dialysis or cleft, the second operation successfully normalized tension. Of the other two, one was later operated with iridencleisis and the other was not reoperated as the tension remained nearly normal, function has been retained to date and patient was averse to further surgery. It may be mentioned incidentally that the site of reattachment in the unsuccessful cases was more often than not posterior to its original anatomical reattachment, thus constituting a retroplacement of the iris root. As in these latter cases, absence of communication between the anterior chamber and the suprachoroidal space was a constant finding, this would seem to be the reason for the failure of the operation to reduce tension. The following case history serves as a good example of this.

REPORT OF CASE

Case 1.—Mrs. H., age 62, hypertension of the left eye, McLean, 65, which was normalized by cyclodialysis operation (below and out) for eight months, after which hypertension returned and gradually increased. Examination showed, as in Fig. 2, the characteristic cleft or aperture between the scleral spur and iris root (at 5). However, after prolonged examination, we discovered that the iris root had healed on to the scleral wall two or three millimeters behind its original anatomical insertion (at 7). The diagram represents a composite picture of what is seen at different angles of regard, and shows the dialysis and where the reattachment of the iris root has taken place. A

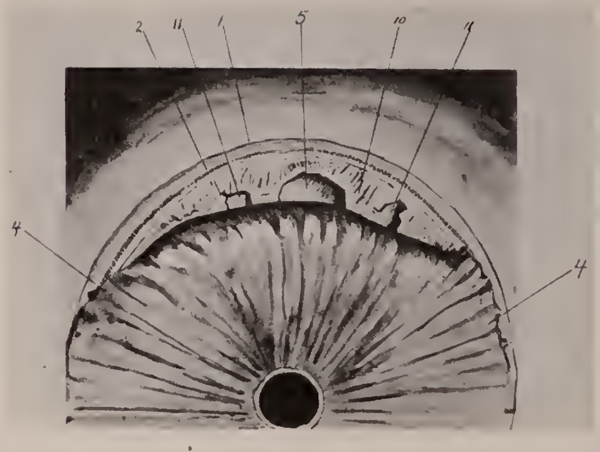

Fig. 3

Fig. 3.—Cleft partly bridged over by a thin membrane. *1,* internal annular ring of Schwalbe; *2,* angle wall; *4,* peripheral synechia (adhesions of iris root to angle wall as result of operation); *5,* cleft showing inner surface of sclera; *10,* membrane bridging over cleft; *11,* fenestrations of membrane permitting of communication between the anterior chamber and the suprachoroidal space.

second cyclodialysis was performed up and out with immediate reduction of tension which has persisted to date (ten months). The second cyclodialized region shows a characteristic cleft extending from the anterior chamber to the suprachoroidal space as illustrated in Fig. 3. Here the cleft is not completely open as in the case illustrated in Fig. 1, but is bridged over by a very thin membrane (at 10) which, however, is incomplete and through its fenestrations (at 11) one can see the scleral wall (at 5) and look into the suprachoroidal space showing that there is a definite communication.

Fig. 2 shows the trabeculum covering Schlemm's canal to have been scraped clean by the spatula. That this could not have been an active factor in reducing tension is proven by the recurrence of tension when the cleft closed—the rest of the picture remaining unchanged.

SURGICAL CONCLUSIONS

In the fourteen cases examined to date, tension has been normalized in all those where the characteristic surgical dialysis, as shown in Fig. 1, has been established. In those cases, on the other hand, in which the iris has been reattached (reattachment to the original insertion or retroplacement), there has been no reduction of tension or the effect has been transitory and lasted only as long as the communication remained open. The disposition to closure we have found to be due to the dialysis being too small in extent, thus favoring adhesions of the contiguous surfaces, or to trauma during operation which creates raw surfaces and stimulates healing of the surfaces through exudation, etc. Thus, for instance, at those points where Descemet's membrane has been traumatized by the spatula, peripheral anterior iris adhesions are seen to form counteracting the very object of the operation. Trauma encourages exudation and formation of iris adhesions in the angle just as it induces posterior adhesions of the pupillary border of the iris to the lens, more especially in that sector of its circumference which corresponds to the sector of the iris which has been dialized. The tendency to exudation and formation of adhesions seems also to vary with the individual.

FACTORS MAKING FOR A SUCCESSFUL CYCLODIALYSIS

Successful achievement of a permanent dialysis is favored by the following factors:

First, separation of the ciliary body with the spatula through a sufficiently large portion of the circumference (two-fifths to one-half).

Second, trauma must be reduced to a minimum.

These objects are promoted by making the scleral incision further posterior and even more diagonal than is customary, thereby facilitating the entrance of the spatula in the tangential plane, as also its rotation through a large arc. Perhaps also the rapid closure of the diagonal valve-like incision favors reëstablishment of the anterior chamber and thus tends to promote the maintenance of the cleft by keeping its surfaces apart. As we believe that loss of aqueous and hemorrhage into the anterior chamber tend to encourage reattachment of the dialysis, we feel that one should attempt to preserve the anterior chamber and prevent hemorrhage. Retrobulbar injection of 1 cubic centimeter of novocain with an extra drop of adrenalin, avoidance of vessels during the approach, complete hemostatis at the site of incision by means of adrenalin wicks, and if necessary, touching the bleeding point with the actual cautery and immediate application of pressure, after removal of the spatula, will in large measure prevent hemorrhage into the anterior chamber in most cases even in inflamed, very hard, chronic glaucomatous eyes, operated under gas and oxygen.

We have noticed that such slight amount of hema as may appear in the anterior chamber has been of venous color. We believe it in part to be sucked in from the conjunctival wound and that there is never occasion for arterial hemorrhage unless it be in the case of marked general vascular disease with arterial degeneration. Even in these we cannot but feel that it is avoidable. Furthermore, in our opinion, postoperative instillation of mydriatics, which is advised as a routine procedure to prevent formation of pupillary synechiae, should also, whenever possible, be avoided. It will be found that if the operation is performed with sufficient lack of traumatism, immediate mydriasis is often not necessary. Mydriasis, we believe, may favor closure of the dialysis by approximating the base of the iris to the site of its previous insertion and in cases of very shallow chambers may also occlude the rest of the angle along with the cyclodialized part, as we have had occasion to observe, and precipitate an acute attack of glaucoma. We have further found that when the dialysis cleft is very great in extent, hypotony is apt to ensue with gradual cataract formation or acceleration of an incipient one.

THE RESULTING ACTION OF CYCLODIALYSIS

Theoretically, the question has not yet been settled whether the dialysis acts by disturbing the function of the ciliary body through severance of its nervous and vascular supply with consequent atrophy and reduced production of aqueous, or whether it acts by permitting outflow of aqueous through the cleft into the suprachoroidal space where it is absorbed. As a result of our observations, we cannot but believe that the question must be answered in the latter sense. In every case of cyclodialysis, the operation has severed the same nerves and vessels and cut the ciliary body off from its supply whether successful in reducing tension or not, whether establishing communication between the anterior chamber and the suprachoroidea or not, whether or not causing permanent dialysis. In those cases which showed the dialysis, tension was always found to be reduced; the reduction of tension was immediate (that is, within twenty-four hours) and remained so. In the unsuccessful ones tension was either not reduced at all or after initial reduction it increased after a time when it was found that the ciliary body was reattached. The only difference between the successful cases and the failures would then seem to be that in the former a dialysis or cleft persists, whereas in the latter, reattachment occurs.

SUMMARY

Our investigations show that the establishment of communication between the anterior chamber and the suprachoroidea is the mechanical sine qua non in the successful action of the operation in most if not all cases. This is of evident surgical and clinical importance. In practice, the method has the further advantage of enabling us to determine the reason for lack of effect of the operation in a given case and of remedying it by repeating the operation until we are satisfied that a permanent dialysis and communication has been established.

DISCUSSION

A. C. Macleish, M. D. (1104 Brockman Building, Los Angeles). — I have read Dr. Otto Barkan's paper on cyclodialysis with much interest, for I have not come in contact with the operation for many years, and had thought that it was generally discarded. His percentage of success is due, I am sure, to a technique considerably better than that of earlier days. The majority of cases I have seen, and many of those I had opportunity to follow up, were decidedly disappointing in results, despite that these were all operated on by men of note in ophthalmology.

It might be interesting to know that in 1911, when working under Dr. Freeland Furgus in Glasgow (Fergus-Elliott trephining), I saw him do several by laying down a flap, trephining a scleral button, completing a cyclodialysis, and replacing his flap with suture. In only one case did I see the after-results, and that showed a subconjunctival bleb over the area of trephining well up on the globe, and normal tension resulting. In most of the other cases I saw there was much hemorrhage as a complication, and this factor, as Doctor Barkan points out, undoubtedly was productive of failure in many cases. Again, our methods of anesthesia were not practiced then and the patients suffered much more.

I have never done a cyclodialysis for several reasons. First, I have had a dread from all my teachings of the ciliary region. Secondly, the results I have seen, and the complications, did not appeal to me. Thirdly, I have not the courage to try it. As I grow older, I expect I am growing more timid.

I once heard in London at Moorfields, when I was in attendance there in 1912, a long, informal discussion on cyclodialysis and, if I remember correctly, the explanation of the mode of action in the operation, although many theories were advanced, did not materialize. Now I find we are still in *status quo ante.*

I should very much like to have the opportunity some time to see Doctor Barkan's operation.

⁂

Melverton E. Trainor, M. D. (924 Pacific Mutual Building, Los Angeles).—The success obtained by the authors in the fourteen cases reported, with eleven cures, is about 80 per cent, which is as satisfactory as can be obtained with any manner of treatment for glaucoma.

As brought out by the authors, the success of the operation depends on the size of the cleft after healing is complete.

The amount of aqueous produced each minute is from 1½ to 2½ cubic millimeters. Therefore, the necessity for the detachment of about halfway round of the ciliary body.

I would like to know just how this aqueous is disposed of, whether it passes directly into the capillaries, is taken up by the lymph spaces, or is absorbed by a new lining of the cleft by endothelial cells?

The success of the operation is due to the greater absorbing power, rather than an interference with the production of aqueous.

The general opinion of cyclodialysis heretofore has been that it is not a cure, but must be followed by miotics. That it is of no use in acute, and chronic uncompensated, glaucomas, nor is it satisfactory in secondary glaucoma following cataract; but in compensated glaucoma it is indicated, especially in early cases. Personally I have had better results in all cases with iridencleisis.

⁂

A. Ray Irvine, M. D. (1142 Roosevelt Building, Los Angeles).—It seems to me that the conclusions in this paper are well founded. The success obtained in these operations is undoubtedly due to the mechanics, relieving obstruction and establishing a free flow of aqueous between the anterior chamber and the suprachoroidea. The operation of cyclodialysis, especially in aphakic cases, is the one of choice. We have had a number of cases at the Los Angeles General Hospital in which tension has recurred, even though in all cases a wide separation of the root of the iris has been made. In these cases a closure of the cleft at the chamber angle probably took place.

⁂

Doctor Otto Barkan (Closing).—The fourteen cases mentioned in this publication were selected from our surgical material solely because of their individual adaptability to the investigation of the question at hand, namely, the mode of action of cyclodialysis, and not for statistical purposes nor as an argument in favor of the operation. The percentage of successes in this small group happens to be high and, as a matter of fact, we do favor cyclodialysis as it is performed today, over other surgical procedures in certain types of chronic glaucoma.

In Professor Elschnig's clinic in Prague, cyclodialysis has been the favorite operation for chronic glaucoma for many years; in other localities external filtering operations are performed, to the exclusion of almost all other operations. There is, as yet, no royal road to surgical success in chronic glaucoma. Our surgical knowledge and indications are very incomplete, and how could it be otherwise until we know more of the physiopathology of the circulation of the intra-ocular fluid, and of the pathogenesis of glaucoma?

We believe that gonioscopic studies of the living angle in relation to surgery, such as have been done by Troncoso and such as we are engaged in with our binocular-microscopic method, will enlighten us and add considerably to our surgical knowledge and practical management of glaucoma.

INJURIES OF THE POSTERIOR URETHRA*

By Harry W. Martin, M.D.
Los Angeles

Discussion *by Robert V. Day, M. D., Los Angeles; Arthur B. Cecil, M. D., Los Angeles; George G. Reinle, M. D., Oakland.*

THIS paper will deal only with certain types of injuries to the urinary tract. Injuries to the kidney and ureter have been excluded, and the classical bladder rupture only incidentally considered.

CLASSIFICATION OF INJURIES OF POSTERIOR URETHRA

For convenience, I wish to make the following arbitrary classification:

1. The so-called "straddle" injury in which the membranous urethra is wholly or partially severed.
2. Classical ruptures of the bladder produced by moderate impacts over a distended bladder, especially in a patient who has imbibed alcohol immoderately during several hours preceding the rupture, and as the consequence of the alcoholic narcosis and anesthesia a greatly distended bladder results, with an easily produced rupture.
3. Instrumental rupture, either to the bladder or posterior urethra.

The above types are dealt with only incidentally, since diagnosis and treatment have been adequately described in the average textbook on urology.

4. This next class of injuries, to which I wish to call your attention, are exceedingly varied in their combinations and complications, and their textbook description and suggested methods of treatment quite inadequate. This is a large group, and therefore I wish to stress their management, especially those of the posterior urethra, produced by crushing force or violent impacts, sufficient to cause the various combinations and types of fracture of the pelvis.

EARLY RECOGNITION IMPORTANT

While the incidence of fractured pelvis is considerable, on the other hand only a comparatively small percentage of such accidents are complicated by urethral or bladder injuries. However, when present, it is of the greatest importance to recognize them early, and promptly institute adequate surgical measures for the purpose of drainage so as to prevent further leakage into surrounding tissues. If in doubt, always institute drainage. Furthermore, in every area, where urinary leakage may seem to be present or even suspected, adequate drainage should be provided. Even unnecessary drainage is productive of no serious results, unless undue shock is already present. If shock is excessive, such shock is probably due to concomitant injuries in addition to the urethral injuries. Not infrequently one or several of such associated injuries as the following exist: skull fracture, fracture of the upper and lower limbs anywhere between the foot or hand and the hip or shoulder joint; fractured ribs and injury of intrathoracic organs; injury of one or more of the abdominal organs, including the spleen or liver. Injury to the rectum is not uncommon and is a most serious occurrence.

SHOCK

Extreme shock as a primary manifestation is usually not observed, if the injury is confined to the urethra or kidney. It is often excessive, however, in complete intraperitoneal rupture of the bladder.

If excessive primary shock is present, obviously any operative measure will probably have to be delayed or postponed; or, if severe and progressive, any surgical measure whatever may be positively contraindicated. Obviously, we believe that in such cases it is unsound practice to resort to surgery when it can hardly accomplish anything more than hasten the end. In these cases the variety and combination of associated injuries may be such that the soundest and most experienced judgment is requisite in order to decide on the wisest course. If a urologist is in charge, he should freely avail himself of consultations with general surgeons, chest surgeons, brain surgeons, etc., as indicated in each case. Fortunately, modern intravenous urography with diodrast, and especially retrograde urethrography with the same non-toxic and non-irritating chemically stable radiopaque solution, has proved of enormous help in precise objective diagnosis in cases of injury to the urinary tract.

FRACTURED PELVIS

In patients with fractured pelvis, there may be no actually demonstrable major ruptures in either the bladder or urethra, as is visualized at operation or determined by preoperative urography, but nevertheless, punctures may be present with slight leakage of urine and subsequent development of abscess. On the other hand, in a certain minority of cases—but still quite an appreciable number—the posterior urethra especially, and the bladder at times, are visibly or palpably punctured by a spicule of fractured bone, or torn, or severely crushed, and yet there can be demonstrated no actual leakage on the operating table. When the posterior urethra is injured so that even a little urine leaks out around it, traveling more or less in the fascial planes, together with bloody extravasation, a deep abscess of great size may develop (Fig. 1). Yet its presence and extent cannot be definitely determined until many days have elapsed, unless we are constantly on the alert. When in doubt, extravasation should be assumed as being present or potentially so, and liberal drainage instituted.

Suspicion or proof of such injury rests on urinary retention, bloody urine, inability of the

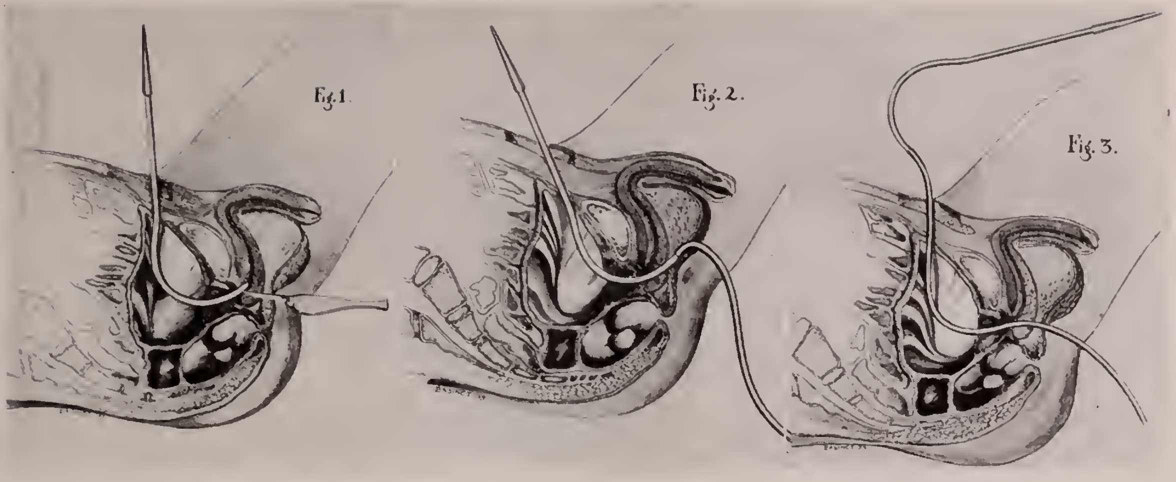

Fig. 1.—Button-holing the bulbous urethra over tip of Guiteras Retrograde Staff.

Fig. 2.—Tip of Guiteras Retrograde Staff is pushed through button-hole in urethra and out beyond the skin of perineum, whereupon a piece of pure gum tubing, 7 or 8 mm. in diameter, is pushed well over tip of staff like a sleeve.

Fig. 3.—Retrograde is withdrawn, carrying the tubing out through suprapubic incision on to the hypogastrium.

urologist to pass a catheter, ecchymosis and tumefaction over the perineum or suprapubic region, scrotum or shaft of the penis. Evidence supplied by a cysto-urethrogram, and rectal palpation, abdominal palpation, or bimanual palpation, with finger high up in the rectum and the hand over the hypogastrium, may reveal tumefaction anywhere between the abdominal hand and the finger in the rectum, giving confirmatory evidence. Shock may be due to a number of factors, and the determination of the principal causative factor in producing the shock is important; each case should be individualized in this study. Concomitant injury to the rectum, or one or more abdominal viscera, is perhaps the most important cause of shock, especially severe shock.

TREATMENT

This consists in 1. Ample drainage, not only of the bladder, but of every area where urine may have leaked into the tissues, even in small amounts. Many times urinary infection has existed previous to the injury. Even if uninfected, urinary extravasation invariably leads to serious infection, by tissue necrosis. Prepare the patient for both suprapubic and perineal operation by shaving the abdomen, the pubis, penis, scrotum, and perineum; before draping, paint all these areas with mercurochrome or other bactericidal solution. The recumbent position on the operating table is ordinarily, we believe, reasonably satisfactory. The lithotomy position, especially if extreme, is not recommended in case of fractured pelvis for the reason that the fractured ends of the rami, are apt to override and cause further trauma to the soft parts, even causing fragments to further pierce the bladder or urethra. A semi-lithotomy position with the knees over Bierhoff's crutches, is the ideal position for working both from the perineum and the hypogastrium. A midline abdominal incision is made over the hypogastrium. It is seldom justifiable to explore the peritoneal cavity, unless there is definite evidence of injury to one or more of the abdominal viscera; in a borderline case the presence and assistance of a qualified abdominal surgeon should be assured. If, as rarely happens in practice, it seems necessary to explore the abdomen, and no intra-abdominal injury is discovered, the peritoneum only is closed and attention then directed to the urinary tract injury. The bladder is opened suprapubically in the classical manner. Inspect the prevesical area; after opening the bladder as high up toward the retracted peritoneal fold as possible, palpate the inner wall carefully and thoroughly for evidence of rupture. If tears are discovered, better exposure may be needed. If not, one should proceed to introduce a Guitterez retrograde staff through the suprapubic opening into the vesical neck, and out through the prostatic urethra into the bulbous urethra; an incision is made in the perineum over the tip of this retrograde staff. (Fig. 1.) The staff is then pushed through this buttonhole opening in the perineum, and a rubber catheter, or a piece of rubber tube the size of a 22 Fr. catheter, pushed well over the tip of the staff like a sleeve (Fig 2); it is encircled and fastened on the staff with a silk ligature tied tight. The staff is then withdrawn, carrying the tube from the perineum into the bladder and up through the suprapubic bladder incision onto the skin where it can be visualized. (Fig. 3.) The rubber tube is released from the tip of the staff and is transfixed with heavy twisted silk—size 12 or 14—and the silk knotted to form a loop. The rubber tube is then withdrawn by pulling on that portion still projecting in the perineum, until the upper end is resting on the trigon (Fig. 4), or the upper end of the tube may be sutured to the skin edge of the suprapubic incision as in Fig. 5. The silk loop is then fastened with a silk suture to the skin of the abdominal incision, giving just enough "rope," as it were, to prevent the rubber tube being possibly withdrawn from the bladder entirely. A suture through the tube into the skin at one edge of the perineal wound will give additional insurance of remaining where it is placed. A Pezzer tube, size 22 Fr.,

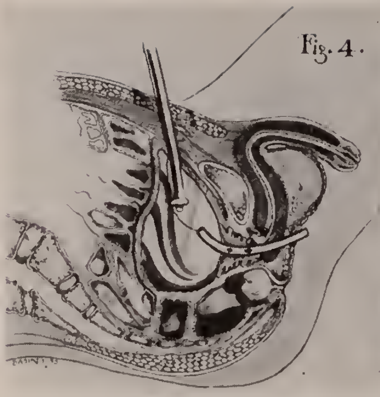

Fig. 4.—Tubing is cut off and size No. 14 heavy braided silk is sutured into end of rubber tube (with side-holes cut out). Tube has been withdrawn so that it rests on the base of the bladder and held there with the heavy silk fastened to the skin of the suprapubic incision, and the other end anchored with one suture to the skin of the perineum. No. 22 Pezzer catheter in place.

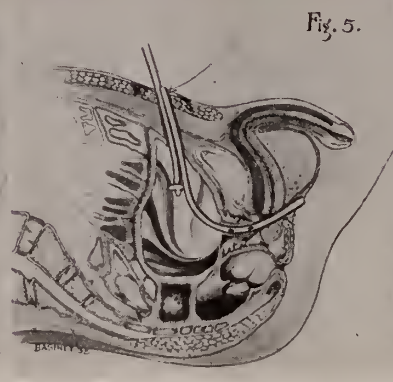

Fig. 5.—Alternate method of having rubber tube fastened by one suture to edge of suprapubic skin incision and by another to the skin of perineum. Pezzer in place.

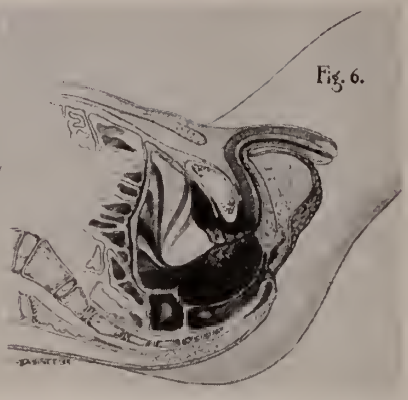

Fig. 6.—Abscess which has developed because of neglect to drain perineally. This not infrequently occurs unless such auxiliary drainage is instituted.

is then sutured in for drainage of the bladder itself. (Fig. 4.)

If there is any ecchymosis or tumefaction of the perineum, scrotum or shaft of the penis, these areas should be liberally incised, as in any case of urinary extravasation.

Any concomitant actual ruptures of the bladder should of course be repaired in the classical manner. Hemostasis should be attended to by ligature, gauze-packing, or both, as needed. The bladder should be closed water-tight around a 24 Fr. Pezzer catheter draining suprapubically. (Larger sizes are unnecessary, and produce discomfort.) A cigarette drain should be inserted into the prevesical space of Retzius. With the completion of such a surgical procedure, absolute drainage has been insured to all potentially infected areas, viz., the prevesical space of Retzius, the bladder, the posterior urethra and peri-urethral tissues in case of puncture of the posterior urethra, perineum, as well as the tissues (when indicated) external to Buck's fascia and its extensions. The ischiorectal fossa should be freely incised and drained if indicated. If necessary, the incision in the ischiorectal fossa is connected by tunneling, with the midline incision in the perineum, that is, by pushing through a heavy blunt forceps followed by a piece of small Penrose drain which is sutured in place.

SUMMARY

The points to be stressed are: Puncture, tear or rupture of the posterior urethra allows leakage of urine into important surrounding tissues, which become infected, thus resulting in sepsis, abscess, often of tremendous size, tissue necrosis, and frequently in ultimate death. These facts are frequently ignored, and the proper drainage, therefore, not instituted. The bladder is naturally attended to early, because the symptoms are early and pronounced, and the textbooks have emphasized its necessity, but pelvic leakage from tears in the posterior urethra is frequently neglected.

All drains should be anchored to the skin with reasonably heavy, non-absorbable sutures such as silk, and left in for an ample time, at least ten days to two weeks. Nature will repair the damage in nearly every case if drainage is ample from every area, especially the tissues surrounding the posterior urethra, where the urinary tract has been traumatized.

Except for straddle injuries, a primary attempt at an open and visualized operation through the perineum is ordinarily unsatisfactory in these cases, and for several reasons. The lithotomy position is not advisable because of a fractured pelvis. There is no telling what damage the spicules of fractured bone may produce by an exaggerated lithotomy position; and if the lithotomy position is not exaggerated, the exposure is poor. Not infrequently in these cases there is considerable injury to and a marked slipping at sacro-iliac synchondrosis. There is also so much ecchymosis and discoloration that tears are difficult to visualize or find. Moreover suture of urethral tears are ordinarily unnecessary and superfluous, since they seldom hold. Primary repair of these urethral tears has been overstressed.

Draining perineally is essential: but this can be accomplished by the retrograde method described above much more safely in a fraction of the time it takes to perform a careful perineal dissection. The additional suprapubic drainage alone is by far the preferable route. Hence, combined method takes less time, insures drainage, and obviates the necessity for placing the patient in the exaggerated lithotomy position. In case of inadequate drainage, an abscess not infrequently forms. (Fig. 6.)

Traumatic strictures, as everyone knows, are most difficult and rebellious to dilatation and tend strongly to recontract, even if successful dilatation seems to be accomplished at times. Much of this scar can be prevented if early and ample drainage is instituted, for the reason that part of this excessive sclerosis is due partly to infection and partly to infiltrates—both cellular and serous—and early drainage is the prophylactic par excellence for both.

REPORT OF CASES

Case 1.—Male, aged 35, fell astride a water pipe, from a height of only two feet. Only a few drops of bloody urine were passed, and for two days nothing was done. In two or three days, swelling in the perineum was noted. On the fourth day, indwelling catheter drainage was instituted; at the end of seventeen days he was referred to an urologist in a metropolitan center, but the perineal abscess formed burst spontaneously en route to the city. He was drained widely in the perineum. Perineal abscesses recurred over a period of several months. Meanwhile the urine became fetid, the bladder irritable and would hold only about one ounce. A cystostomy was performed and suprapubic drainage maintained for six weeks, at the end of which time the tube was removed and the bladder opening allowed to close. Meanwhile the perineal sinuses had healed.

When I first observed him months later, he had a contracted, thickened bladder, with a maximum capacity of 25 cubic centimeters and absolutely putrid urine loaded with pus, streptococci, staphylococci, and bacillus proteus. One kidney was a fibrous pus sac and the other pyonephrotic. He died of sepsis fourteen days following drainage of the pyonephrosis. Previous drainage by ureteral catheter had been unsuccessful. Although we have no means of ascertaining the facts, it is not likely that this patient had a latent urinary infection at the time of injury. On the other hand, the important procedure of adequate drainage at an early stage of his observation would probably have made possible a better clinical result, and the saving of much money by the insurance company.

* * *

Case 2.—Male, aged 18, was injured when his automobile, traveling at excessive speed, hit a telephone pole. He sustained a fractured skull, a fractured arm and ankle, besides multiple fractures of the pelvis. A catheter was introduced easily and, so it was stated, clear urine was obtained. Two weeks later, it was also stated, there was evidence of urinary extravasation over the hypogastrium, at which time a urologist was consulted and suprapubic cystostomy was performed. In justice to his surgeons, earlier cystostomy was considered; but the extreme shock with a systolic pressure of 55, constitute the reason for not performing the cystostomy drainage sooner.

Infection was present and persisted until his death, two and one-half years later. In the interim the patient had undergone many operations; one kidney had been nephrotomized twice, and the opposite kidney once, for calculosis, recurrent each time. Two or three operations (unsuccessful) had been performed for the restoration of the deep urethra. Had early drainage—within twenty-four or forty-eight hours—been instituted, probably his serious and fatal urinary infection would have been prevented.

* * *

Case 3.—Male, aged 35, automobile accident, multiple fractures of the pelvis. Injury to urinary tract. The patient was promptly drained suprapubically by cystostomy, but not drained perineally. The patient was septic, and about two weeks later perineal drainage was instituted, releasing several hundred cubic centimeters of purulent fluid. Meanwhile, widespread sloughing of skin and deeper tissues had resulted. The patient recovered, but with much permanent damage to a widespread anatomical area, most of which could have been avoided. The patient should have had ample perineal drainage, in addition to the suprapubic cystostomy.

* * *

Case 4.—Male, aged 40. Automobile collision, with resulting fractured pelvis and injury to urethral tract. Cystotomy was performed early, but perineal drainage was not done. One week later perineal operation was performed, with escape of a large amount of purulent fluid. Meanwhile, much permanent damage to the urinary tract had resulted which probably could have been obviated had perineal drainage been instituted at the time of the suprapubic operation; besides the sepsis incurred and an almost intractable stricture also resulted. Necrosis and virulent infection ensues rapidly where the drainage has not been adequate.

COMMENT

The above cases are excellent illustrations of insufficient drainage. These case reports can be multiplied many times over. The repeated examples of intense tissue sepsis, with resultant abscess formation, severe stricture, tissue necrosis, and eventual loss of life, drive home the need of sufficient drainage by the combined suprapubic perineal method. The patient's life is made more tolerable; his permanent results, if he survives, are better and the complications yield more readily to the proper follow-up therapy. It must also be remembered that the proper handling of the lower urinary tract will obviate such sad upper urinary tract complication, as shown in Cases 1 and 2.

Besides the infection, permanent filiform strictures result in patients who survive. We have clinical case records of many patients with filiform strictures resulting from inadequate treatment, especially drainage at the time of injury. These strictures are very resistant to all forms of therapy.

6253 Hollywood Boulevard.

DISCUSSION

Robert V. Day, M. D. (1930 Wilshire Boulevard, Los Angeles).—Many articles have appeared in the journals and textbooks on traumatic rupture or severing of the urethra. Most of these, however, deal with the so-called straddle injury, and simply follow out or copy those written fifty years ago. Almost invariably these articles had little or nothing to say concerning urethral trauma associated with fracture of the bony pelvis. Up to the last twenty or twenty-five years, fractured pelvis was relatively uncommon, except in connection with certain trades or occupations such as mining, etc. But during the last twenty years especially, due to the intensive industrialization of the nation and especially due to automobile accidents, fracture of the pelvis has became a quite frequent occurrence, and a certain percentage are complicated by severe urethral trauma. Dealing with such cases in the orthodox manner recommended for straddle injuries is, unfortunately, the method usually followed. As a sequel, the end-results have often been poor, not to mention the fact that some probably unnecessary fatalities have occurred. When the methods proposed and practiced by Doctor Martin have been followed, one may expect the best possible results. Many of these injuries are so severe and complicated by injury to other important organs, both in the vicinity of the prostate and also anatomically remote, that there is bound to be some mortality; but my experience leads me to feel very sure that Doctor Martin's procedure gives by far the best end-results and the lowest mortality rate. If ample drainage is carried out both suprapubically and perineally, and maintained, the tears and ruptures usually take care of themselves unless the urethra is completely severed transversely; in which case, of course, it is necessary to suture the roof of the urethra only. Too much suturing in these soft, contused ecchymotic tissue defeats its own purpose. With multiple fractures of the pelvis, placing the patient in the exaggerated lithotomy position is not the best practice when it can be avoided.

⁂

Arthur B. Cecil, M. D. (1016 Pacific Mutual Building, Los Angeles).—Doctor Martin has made a genuine contribution to urology. With the frightful increase in automobile accidents resulting in injuries to various parts of the body, injuries of the urinary tract have become almost clinical entities to be classified with the various well-known diseases. The posterior urethra is, however, exceedingly well protected, and for this reason the average surgeon sees only an occasional case of traumatic injury of this region. All the more important is Doctor Martin's paper. His advice, to freely and early drain after these injuries, is, of course, correct. The trouble is in diagnosing the condition early, particularly when the patient is in great shock. Doctor Martin's technique for draining this region by suprapubic drainage, and by retrograde perineal drainage, is a very valuable suggestion. I feel that all urologists are tremendously indebted to him.

⁂

George G. Reinle, M. D. (204 Dalziel Building, Oakland).—Doctor Martin's contribution on injuries of the posterior urethra has covered the subject thoroughly and well. That he has not been able to advance anything new is of small moment to the urologist. Its value lies in what, times without number, this speaker has conceived to be the paramount duty of the special worker in any and every field of medical practice. I refer to the latter's obligation to the profession in general. And this, I take it, is what the author has mainly in mind.

In season and out, and in whatever way he can and through whatever medium he finds available, the man who has acquired knowledge through limiting his work to a narrow field, not common property, is duty bound to warn the general worker of certain obligations he must not hesitate to perform.

In rupture of the urethra the main danger confronting the nonspecializing worker, due to the tendency to urinary obstruction, extravasation, or the formation of a fistula, is that he may not early enough realize the gravity of the situation.

Lest it may not be to the front of every medical man's mind, it cannot be too often brought to his attention that urinary extravasation does have a 50 per cent mortality rate. If, therefore, every other patient treated either timidly or expectantly is going to die, the specialized worker, should he not harp upon the subject, would be derelict in his duty and unworthy of the burden laid upon him as a coöperator in the common field devoted to the conservation of life.

This, then, seems to me to be the great and significant service the author of this paper has performed. I congratulate him upon having conveyed a message and a warning skillfully, adequately, and soundly. It is to be hoped that the paper will be widely read, and that the recommendations will be followed without hesitation; for to delay is to sentence the patient to death, which with courage might have been avoided.

AGRANULOCYTIC ANGINA*

By W. H. Johnston, M.D.
Santa Barbara

Discussion *by S. v. Christierson, M.D., San Francisco; Frank A. Burton, M. D., San Diego.*

THE term agranulocytosis was first used, and the syndrome first described as a clinical entity by W. Schultz[1] in 1922. Friedemann[2] proposed the name agranulocytic angina—a term now frequently used in this country. Various other terms, among them malignant neutropenia and granulocytopenia or granulopenia, have been suggested to describe the characteristic blood picture of this syndrome. While Schultz[4] was not the first to see this type of cases, "he realized that the cases which he reported differed from the usual instances of angina, on the one hand, and from the recognized cases of leukopenia on the other."

EARLY LITERATURE ON THE DISEASE

Ridpath[32] reviewed the history of this syndrome, and found that references in the literature began in 1857. It was not until 1902, however, when Brown reported a fatal case, that any decided interest was manifested in the disease.

Schultz,[4] in 1931, described agranulocytosis as an acute febrile disease, with lesions of the mucous membrane of any part of the intestinal tract from the esophagus to the anus; the mucous membrane of the mouth and pharynx, and in the female the vulva and vagina, which are often involved. The characteristic blood changes are a marked leukopenia and the complete or almost complete disappearance of the granulocytes with little change in the red cell or platelet count.

Taussig and Schnoebelen[6] collected 334 cases from the literature. Of these, 226 occurred in females and 104 in males; 74 per cent showed inflammatory lesion in the throat and 40 per cent occurred in the age period from 40 to 60. In 1930, Stocké[5] collected eighty-eight cases from the literature, and of these, 61 per cent were of the "true" type described by Schultz.

Kracke,[7] in 1932, collected 250 cases with a mortality rate of 85 per cent, and the ratio of females to males was four to one in his series.

Stewart, Tocantins, and Jones,[8] in 1933, tabulated 176 cases with special reference to the bacteriological findings. The total mortality was 85.2 per cent. Blood cultures were positive in 38 out of 139 cases, and only two of those having a positive culture recovered 94.7 per cent, while in the negative blood cultures the death rate was 85.1 per cent. Streptococci, staphylococci and pneumococci were the organisms found in the positive blood cultures, and their relative frequency was in the order named. Throat cultures were made in sixty-eight cases with fifty-two positive; streptococci, staphylococci and Vincent's organisms predominating.

In 1934, Kracke and Parker[9] stated that they had collected 473 cases in the United States alone. Approximately 350 cases had been reported in Germany, 100 in France and only six in England. Commenting on the symptoms, Jackson[10] says that they are "legion," and may involve "almost any part of the body." He states that unless the white cell count drops below 2,500 per cubic millimeter, the case cannot be considered as one having the true disease.

While agranulocytosis is most common in adults of middle age, cases have been reported in children. Givan and Shapiro,[11] in 1933, collected twenty-nine cases of the disease in children, and added one of their own. Of the thirty patients in the series, twenty-six died. There was no sex predominance in this group. In all but four cases there was a history of acute infection immediately preceding the onset of the agranulocytosis, and a definite anemia was noted in all but one case.

Middle-aged women are most often affected in the proportion of about two to one. Most of the cases cited are from America and Germany, but reports also come from France, England and rarely from Italy. From the above it would seem that countries using the largest amounts of analine dyes and coal tar drugs, have most cases to report.

---

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association, at the sixty-fourth annual session, Yosemite National Park, May 13–16, 1935.

ETIOLOGY

According to Schultz's[4] theory, some unknown factor destroys the granulocyte producing portion of the bone marrow. Owing to this fact the bodily resistance to infection is diminished, especially the local resistance of the mucous membrane. The throat lesions are not to be regarded as the portal of entry of a causative infection, but as a point of diminished resistance to any infection that may be present. Because of this diminished general resistance, a generalized septicemia may occur. Schultz notes that the syndrome may be produced by certain drugs, chief among which are the arsenicals and the gold salts.

Stocke[5] is of the opinion that there is a particular type of reaction of the blood-forming elements of the body to various toxins which may be of a bacterial or chemical nature.

Kracke and Parker[9] note that at least twenty-five organisms have been found as invaders of the blood stream, but feel that in the clinical development it is necessary to presuppose the existence of a previously weakened or damaged bone marrow which may be either acquired or congenital. Pepper[3] notes that allergy has been present in all of the cases studied by him, and suggests that this may be an underlying cause of the leukopenia.

In the case here reported, there was present an infection of the nasal sinuses which seemed secondary to an allergy.

Loveman[12] collected from the literature sixty-four cases of blood dyscrasias resulting from administration of arsphenamin. Of these cases, fifteen were agranulocytosis, with six deaths. He concludes that both arsenic and the benzol radicals are probably responsible for the blood dyscrasias. The possibility of a syphilotoxic factor must also be considered.

More recently the fact that certain coal tar drugs, chiefly amidopyrin, may cause agranulocytosis has been recognized.

Clinical observation and animal experiments led Kracke[9] to conclude that drugs containing the benzene ring as their nucleus are an important factor in the causation of idiopathic granulopenia. They maintain that bone marrow depression is due to oxidation products, and not to the drugs themselves.

In a recent article (1934) Kracke and Parker[13] collected fifty cases due to drugs of the "easily oxidizable benzene ring" type, especially amidopyrin (forty-six cases), occasionally phenacetin and in one case dinitrophenol. Their studies indicate that quinone and catechol are the direct responsible agents, being the oxidation products of these benzene ring drugs.

Madison and Squier[14] report fourteen cases of primary granulopenia, in which the onset was directly preceded by the use of amidopyrin alone or in combination with a barbiturate. Eight of the patients discontinued the drug and of these only two died. Of the six who continued the use of the drug, all died. One rabbit given allonal by mouth developed granulopenia and died; seventeen other rabbits given amidopyrin showed no change in the blood picture. Madison and Squire believe that granulopenia, following the use of such drugs, may be due to allergic or anaphylactoid drug reaction.

Two cases of neutropenia developing during amidopyrin administration have been reported by Rawls,[15] and Benjamin and Biederman[16] report a case of agranulocytosis that responded favorably to the x-ray, but in a period of good health the ingestion of ten grains of amidopyrin caused a return of all the symptoms within forty-eight hours. Fitz-Hugh,[17] in a recent study of twenty-six cases, found that in seventeen there was very definite evidence that the ingestion of amidopyrin was a contributing etiological factor. Idiosyncrasy to other drugs and also to certain foods, bacterial toxins or chemical toxins may be a cause.

Watkins[34] reported a series of fifty-four patients with true agranulocytosis observed at the Mayo Clinic. Of these there were eighteen who had taken amidopyrin either alone or in combination with other sedatives, but exclusive of the barbiturates. Two of the eighteen died, having taken amidopyrin during the entire course of the illness. Eight of the entire series had taken amytal or sodium amytal. Five of these eight died and in one who recovered and had recurrences it was demonstrated that attacks could be produced by amytal. Seven patients received pentobarbital sodium before the onset and four died; four had taken allonal, three died; two had taken luminol, one died. The endocrine possibility is one which is a research problem and is now being studied by Kouzelmann.

Costen[35] reports three cases: one used quite large quantities of sedatives, aspirin and phenacetin; another was a persistent user of allonal; and the third one used sedatives, usually bromids.

From the literature one must conclude that the ingestion of coal tar derivatives, barbituric acid derivatives and pyramidon do play an important part in the etiology of agranulocytic angina.

We must admit, however, that few, if any, reports of this malady have come from institutions treating nervous and mental diseases where large amounts of barbituric acid sedatives are used.

PATHOLOGY

In most fatal cases Beck[18] notes that the bone marrow is degenerated and sometimes liquified, the color varying from red to straw color. He states, however, that there may be even a myeloid hyperplasia. Beck[19] suggested that in case the myeloid tissue is normal or hyperplastic, it is due to absence of the chemotactic factor, and that the cells do not enter the circulation. He notes that nucleotid K96 supplies a chemotactic, but not a maturation factor, and this may explain the failure of this remedy in a certain percentage of cases.

In 1931, biopsies of the bone marrow of the sternum in two cases of agranulocytosis were reported by Dameshek and Ingall.[20] In one case nothing abnormal was found. In the second case, biopsy was done when the white cell count was 600 per cubic millimeter, and granulocytes completely absent. The bone marrow smears showed many erythroblastic cells, and typical myeloblasts, but complete absence of both myelocytes and polymorphonuclear cells.

At the Mayo Clinic, Conner and his associates[21] report that in cases of agranulocytosis that came to autopsy, the characteristic findings in the bone marrow was a marked aplasia of the cells of the myelocytic series. "Proliferation of the granular cells appeared to be at a standstill." They note also that in tissues that were the site of inflammatory reaction and necrosis, there was no polymorphonuclear cell infiltration.

Fitz-Hugh[22] reported autopsy studies on three cases, none of which showed complete aplasia of the bone marrow.

Fitz-Hugh and Comroe[23] reported autopsy findings in nine cases in 1933, and they conclude that in this disease there is maturition arrest rather than actual granulocytic aplasia. This factor either arrests the development of the white cells or produces degenerative changes in them before they are sufficiently developed for normal migration to the blood stream.

Jackson[10] makes a similar conclusion after a study of seven cases coming to autopsy. Jaffe[24] studied the bone marrow of nine cases. The essential pathologic process appeared to be a "disintegration of the specific granules of the myelocytes." Three cases in which there was a transition from agranulocytosis to acute leukemia were reported by Strumia.[25] His autopsy findings were a defect in the bone marrow whereby the immature parent cells become incapable of maturition. In leukemia these immature cells are released into the circulation, in agranulocytosis they are not released.

Postmorten bacteriological studies by Stewart, Tocantins and Jones[8] in fifty-nine cases showed thirty-six positive cultures. Postmortem blood culture was positive in seventeen; spleen in nineteen; bone marrow in five. Streptococci were found most frequently in all sites. In the case here reported, cultures from the throat, the secondary abscesses and from the blood, revealed Staphylococcus albus. The life cycle of the granulocyte is from three to five days; therefore, a dysfunction of the bone marrow lasting for five days would cause a complete disappearance of the granulocyte. Complete absence of granulocytes from the blood stream for a period of seven days is incompatible with life.

In the acute severe cases the myocardium shows changes of toxic degeneration. There is cloudy swelling of the liver and proliferation of the reticulo-endothelial cells of the spleen. The kidneys show comparatively little change. The stomach shows widespread congestion and superficial lesions. The lungs contain scattered superficial hemorrhages and pleural exudate.

Shea[36] concludes that the toxins of the various anginas may either stimulate or paralyze the hematopoietic system.

SYMPTOMS

The most important early symptoms are: prostration, malaise, lack of ambition or initiative, easily fatigued, require abnormal rest and sleep, and there is a slight increase in temperature. There may be a history of repeated throat infections, but the findings are out of proportion to the general symptoms. The throat lesions commonly seen are the grayish ulcerative areas on the pillars, pharyngeal wall, uvula and extending down as far as can be seen.

In the case reported here, there was marked swelling of the lateral and posterior walls of the pharynx, appearing, much like a retropharyngeal abscess.

TREATMENT

In 1931, Taussig and Schnoebelen[6] gave an analysis, the results of the various methods of treatment in cases that survived more than forty-eight hours after treatment was instituted. It was shown that the mortality was 53 per cent in cases treated by irradiation; 64 per cent when treated by transfusion; 73 per cent when treated with arsphenamin, and 75 per cent when treated by other measures. Kracke[7] recommends frequent blood transfusions.

Stimulating doses of x-ray to long bones; colloidal sulphur intravenously; massive doses of liver extract by mouth; application of antiseptics to the ulcers; and cardiac stimulants. Jackson and his associates[26] at Harvard reported in 1931 the treatment of twenty cases by injection of pentose nucleotid K96. In 1932, they[27] reported an additional forty-nine cases, sixty-nine in all. Of these, 74 per cent recovered completely. Fifty-four were typical agranulocytic angina cases, and of these, 70 per cent recovered, seven had relapse and later recovered after use of nucleotide. Two others, who had relapses, died. Intravenous use of this preparation is used only in the "desperately ill" patients. The intramuscular injection causes little, if any, unfavorable reaction.

In 1933, Reznikoff[28] reported fifteen cases treated with adenin sulphate intravenously. Recovery resulted in nine cases.

Foran,[29] in 1932, treated a case by the intravenous injection of liver extract, where recovery resulted. In 1933, the same author[30] reported four more cases treated by the same method, with one death.

Strumia[31] described a method of preparing a "leukocytic cream" from normal human blood. He treated ten cases, and had eight recoveries; but in five of the cases treated he also used pentose nucleotide or transfusions.

In reviewing the literature, one must conclude that the treatments which have given the best results are: x-ray, pentose nucleotide K96 or some similar preparation, and blood transfusion. Ridpath[32] outlines the technique of x-ray treatment and feels that best results are obtained by this method. Observers have noted that multiple abscess formation seems to have a favorable effect on the course of the disease, and this is apparently true of the case reported.

REPORT OF CASE

O. J., 47 years, white female, married twenty-five years, no pregnancies. Referred by Dr. W. E. Johnson on account of a very severe sore throat. She was admitted to St. Francis Hospital on February 24, 1932, complaining of extreme weakness and inability to swallow or open the mouth.

Present Illness.—While doing her housework a few days before, she had a chill and suddenly felt very weak and had pains all over the body. She went to bed at once, but got no relief from her feeling of weakness. In about an hour she attempted to get up, but was unable to do so. This state continued for several days and she remembers nothing more that transpired, except that her throat was sore, and that it became progressively worse each day.

Past History.—Patient has not been a rugged person, but has always done her own work. She has had considerable nasal sinus trouble and had an operation several years ago. No drugs, such as pyramidon, amytal, luminal, arsenic, have been taken by her. She has not been exposed to the x-ray or radium. There has been no contact with fruit-tree sprays, paints, lacquers or dyes. She had the usual childhood diseases. Rarely has a sore throat.

Physical Examination.—Poorly nourished woman, the skin and sclerae having a distinct icterio tint. Aside from a pulse rate of 110, the general physical examination was negative. Throat—Marked redness and swelling of the mucous membrane of the entire pharynx. The ulceration begins on the posterior pillars, and extends down as far as it is possible to see, and also up into the nasopharynx. A grayish membrane covers the ulcerated area, and on the right side there is a swelling which appears like a retropharyngeal abscess. On palpation this mass felt quite firm, and no attempt was made to incise it. A view of the larynx was impossible. There was no enlargement of lymph glands in the neck. Cultures were taken to eliminate the possibility of diphtheria; the report was negative. The temperature was 102. Smears and cultures from the throat showed Staphylococcus albus.

Blood Examination.—Wassermann negative. White cells 500 per cubic millimeter, all small lymphocytes. Red cells 4,000,000. Hemoglobin 70 per cent. The urine contained a trace of albumin, and some pus cells. Icterus index, 20. She was given a transfusion of 500 cubic centimeters of citrated blood, after which the temperature rose to 105.6 and the white cells to 600 per cubic millimeter. She was also given 10 cubic centimeters of leukocytic extract, and on February 25 another transfusion was given. The white cell count rose to 1,150, with 5 per cent granulocytes. Leukocytic extract was repeated four times and transfusion once. On February 26 a blood culture was taken and Staphylococcus albus found. During the next week an abscess developed in the forearm, just below the elbow. This was opened and a drain inserted. After the third transfusion, the granulocyte count suddenly rose to 38 per cent. Eight days after admission it was 95 per cent. During the next ten days the white cell count reached 41,000. The throat condition was treated by application of antiseptics, astringents and hot alkaline gargles. It improved as the blood picture improved, and the patient left the hospital on April 18 in good condition.

Blood counts made several times in the past three years did not show an abnormal condition.

The last count, made on April 20, 1935, was: Red blood cells, 5,500,000; white blood cells, 9,800; hemoglobin, 92 per cent; polymorphonuclears, 75 per cent; lymphocytes, 21 per cent; eosinophiles, 4 per cent.

CONCLUSIONS

1. Observations on the etiology of agranulocytosis are important in view of the increasing use by the laity, and without medical supervision, of synthetic compounds of the barbiturates and benzene ring bodies. Some education of the general public seems necessary.

2. It is definitely proved that the pathology is primarily in the bone marrow, and the necrotic lesions in the mucous membranes are only a local manifestation of a systemic condition.

3. Increased care should be given to taking histories, and more attention should be paid to blood examinations.

4. In treatment, the results from scientific use of the x-ray seem to be the most satisfactory. Nucleotid, leukocytic extracts and blood transfusions were used by many observers with good results.

DISCUSSION

S. v. Christierson, M. D. (490 Post Street, San Francisco).—Agranulocytic angina is a subject that should be brought up frequently because of the comparative rareness of the condition, its formidable nature and the changing methods of treatment due to the fact that the fundamental etiology is not yet determined.

The name "agranulocytic angina" is unfortunate because it unduly stresses the throat symptoms, angina being the Latin equivalent for quinsy or sore throat. As has been pointed out by the author, the throat manifestations are only secondary and not important. Agranulocytosis, or malignant neutropenia, seems to me more descriptive; agranulocytosis, probably the best, as it has become the most familiar in literature.

The importance of diagnosis in an ulcerative sore throat, which can invariably be made with a blood count, cannot be stressed too much because of the unfortunate and serious consequence if arsphenamin is given therapeutically, confusing the condition with Vincent's angina, which is the most common mistake. The arsenicals have a very severe depressing effect on the white blood cells in agranulocytosis.

Most of my information regarding treatment in this disease comes from Doctors Chandler and Wyckoff of Stanford Medical Schools. Since 1931 they have personally studied and supervised the treatment of twelve patients. Minute and frequent observations were done on blood counts, and in several instances on the bone marrow by biopsies. Only two of the twelve have died, and the rest have now been observed for the most part for over two years. Pentnucleotid was given to all, and with the best results. Transfusions were found to be of no benefit, even harmful at times. Removal of drugs used belonging to the amidopyrin and barbituric acid groups is of great importance, as their effect in all but one patient was unmistakable. The use of x-ray over the body requires caution, as large doses have been shown to diminish the number of white blood cells. On the other hand, evidence has recently been brought out by Doctor Chamberlain of Temple University that moderate doses boost the number of white cells, and if given in very severe cases during the four- or five-day period of waiting necessary for the pentnucleotid to act, x-ray may prove a life-saving therapeutic adjunct.

Clinically, the ten patients out of twelve are well; but examination of the bone marrow in at least one of these patients shows a definite impairment in the maturation of the granulocytes, indicating a continued fundamental disturbance in the marrow.

Doctor Hanzlik, in a recently published review of the drugs affecting agranulocytosis unfavorably, gives a most complete list of all such drugs.

A quotation from this article of Doctor Hanzlik's sums up, I think, very nicely the *status quo* of this formidable disease: " . . . it appears reasonable to regard agranulocytosis as an idiopathic disease of the myelogenous structures of unknown etiology, which is rare, but subject to sudden exacerbation by a variety of conditions, including the use of drugs and toxins of variable compositions. The syndrome, in its gravest form, may be precipitated by a relatively insignificant condition or event; which should emphasize the need of the greatest vigilance in suspected cases, or in persons of known sensitivity to drugs and agents in general. It is possible that the condition is an allergic phenomenon."

⁂

Frank A. Burton, M.D. (1206 Bank of America Building, San Diego).—Doctor Johnston has made a comprehensive review of the literature on agranulocytic angina, including the known and accepted facts pertaining to diagnosis and treatment. He has presented an important case of his own where the patient recovered through his treatment.

During the last two and one-half years I have seen, in consultation, two new cases of agranulocytosis—both fatal. I subscribe to the belief of others that dentists and physicians should be continuously alert for early manifestations of this disease, and that all cases of proved agranulocytic angina should be reported.

In a recent paper I presented the result of my study of the data collected from twelve cases of agranulocytosis, ten of which were fulminant and fatal, two recurrent. The two recurrent cases are still under the observation of an internist, differential blood counts are being made at intervals of a week or ten days.

Since my report two and one-half years ago, one patient has had two recurrent agranulocytic attacks, one severe and one mild. In treatment of the severe attack, Nucleotid K96 was successful; for the mild attack, liver therapy was sufficient. The other patient, during the two and one-half year period, has had two attacks: one severe, associated with becoming unusually tired from a long, fast walk. In each attack, Leucocytic Extract brought prompt results. (The patient, in the initial attack, failed to respond to Nucleotid K96, but was promptly helped by Leucocytic Extract.)

Doctor Johnston is to be congratulated upon the favorable result obtained in his case. He shows wisdom in keeping in touch with this patient, for the reason that even after three years the disease, or syndrome, may prove to be recurrent. When vital force and resistance are low, there may develop also a disturbed biochemistry.

The literature and personal experince justify the conclusion that, in these cases, scientific coöperation includes warning a recovered patient that at any time he may have a fatal attack; that he should keep his general health in the best possible condition; that he should provide against becoming physically or mentally exhausted; that it is not safe for him to undergo surgery without a differential blood count.

As I indicated in my paper, to which I have already referred, agranulocytic angina is a disease, the early diagnosis of which is facilitated by thorough taking of histories, and, where potential agranulocytosis is suspected, frequent differential blood counts. And that importance should be attached to the early recognition of the septic lesions by the otolaryngologist and the dentist that warning may be sounded to the internist, in order that there be no unnecessary delay in the correlation of diagnosis and therapy.

Doctor Johnston (Closing).—It does seem that the various papers written on this subject in the past few years have been worth while in calling our attention to a comparatively rare disease. In the early reports the mortality rate was given as from 75 to 90 per cent; today Doctor Christierson has reported twelve cases, with only two deaths, or about 16 per cent. I again stress the importance of blood examinations and more careful history taking, especially as to drug habits.

Within the past ten days I have had the opportunity of observing another case of agranulocytic angina. A middle-aged female, who had undergone a surgical operation five days previously, developed sore throat, increase in temperature, and marked weakness. A blood examination revealed only 500 white cells per cubic millimeter, almost all being the mononuclear type. During the five postoperative days, she had been given several tablets of allonal for insomnia.

Her treatment consisted of blood transfusions, x-ray to the long bones, and pentonucleotid repeated daily. In one week the blood picture had returned to normal, the throat ulcer had healed, and the general condition had markedly improved.

BRAIN TUMORS IN CHILDREN*

By A. J. Scott, Jr., M.D.
Los Angeles

Discussion *by Carl W. Rand, M.D., Los Angeles; Orville N. Meland, M.D., Los Angeles; Howard A. Brown, M.D., San Francisco.*

Brain tumors in children are not common, yet they are not rare. Tuberculosis, syphilis, brain cysts and brain abscess, though they may give symptoms resembling tumors, are not considered in this discussion.

The causes are unknown, but it is stated that some are formed of primitive embryonal or fetal rests, and may be primary or secondary to similar formations elsewhere.

Cushing[1] gives a ratio of brain tumors in children as compared with adults of 1 to 6 and proportions cerebellar to cerebral tumors in children as 2 to 1; whereas in adults they are 1 to 5. Crothers states that brain tumors are rare in infancy and are usually inoperable.

TUMOR TYPES IN CHILDREN

There are three types of tumors in children: First, gliomas, the most frequent; second, congenital tumors; third, tuberculomas. Cushing[1] states that "not all gliomas are seriously malignant tumors."

Gliomas may be divided into:

(*a*) Spongioblastomas, highly malignant, rapidly growing, but occurring in less than 1 per cent in children.

(*b*) Medulloblastomas, essentially tumors of children, are midcerebellar, and arise from the roof of the fourth ventricle. They are rapidly growing, tend to recur, have a six months' preoperative history, and do well for six months postoperative, while a five-year postoperative history is exceptional (Cushing).

(*c*) Astrocytomas, fourth ventricle tumors, are slow-growing and have a better prognosis. They are twice as common as medulloblastomas.

SYMPTOMS

Symptoms in brain tumors are due to intracranial pressure. In children the sutures may be ossified, but when hydrocephalus develops, headache, optic neuritis and vomiting occur. The sutures may open when the pressure gets too great. The development of hydrocephalus in a child, who has previously had a normal size head, is suggestive of brain tumor. When pressure in the skull rises, deep tendon reflexes become sluggish and finally disappear. Headache is rare in children, except during acute infections especially with a temperature. If a child complains of frontal headache and the attacks come on daily, or are persistent, eye-strain must be ruled out. If the pain is occipital or on top of the head, eye-strain is not likely. Occasionally the headache is sharp, or it may be dull and steady, and sometimes worse at night. Rarely does localization of a headache localize the tumor. Vomiting in the morning or during the day, irrespective of food, plus a headache, is suggestive of brain tumor. In cerebellar tumor cases, morning vomiting is a major symptom. Cyclic vomiting and acidosis may be ruled out by the history.

The cause of eye-strain, blurring of vision or nystagmus, must be carefully studied. Choked discs or fullness of the vessels is a valuable finding in the study of obscure cerebral symptoms. Cushing[1] says: "A median tumor of the cerebellum is so common a lesion in preadolescence that when a child has unexplained vomiting, shows a possible enlargement of its head and gives a story of periodical unsteadiness, it is well to be on guard, and to have a look at the eye-grounds every week or two."

Motor disturbances in the use of the arms, hands or legs, and an unsteady gait when developing in an apparently normal child, should cause one to suspect a brain lesion.

Convulsions occur in about one-third of the cases. Epilepsy must be ruled out if the severity, duration and frequency of the convulsions are indefinite. Vertigo may be present in subtentorial tumors.

Bradycardia does not always occur, particularly in third ventricle tumors, if there is no pressure through the iter the vagus center is spared.[2] The respiration may be slow and irregular, if intracranial pressure is increased.

Psychic disturbances, such as irritability, hallucinations, altered disposition, drowsiness or insomnia and increasing mental deficiency may be present when the tumor is in the region of the frontal lobe.

The spinal fluid usually shows no changes. The temperature is generally unaffected until just before death, when there may be a sudden elevation. Hyperpyrexia is extremely rare. The blood pressure is not significant. Dilated scalp veins do occur occasionally.

---

* Read before the Pediatric Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13–16, 1935.

Roentgen studies of the skull may reveal abnormalities, but the findings are not constant.

Ventriculography and encephalography are valuable aids, but the amount of information obtainable is not worth the risk. "They should be done only when localizing signs are absent, and encephalography is never done in the presence of choked discs."[3] (Personal communication—Doctor Rand.) A careful neurological examination will reveal the same information.

REPORT OF CASES

Case 1.—June, six years old, was seen September 21, 1927, in consultation with Dr. George M. Stevens of the Los Angeles City Health Department as a possible case of poliomyelitis. She was the oldest of three. She had been well up to August 1, 1927, when her left eye began to turn in. A few days later she was examined for glasses, and her parents were told at the same time that she had large tonsils, which were later removed. About September 9, when walking, she would stumble and fall. Later it was noted that she staggered, would run into things and fall, bumping her head and occasionally falling on her face.

From August 1 to September 21, when sleeping, she would jerk and quiver. Due to the tonsillectomy her appetite was poor, but her bowels were normal.

On examination she was very irritable. Her rectal temperature was 99.8. She had a left external rectus palsy, a drooping of the left upper eyelid and a left facial paralysis, a bilateral horizontal nystagmus, and in the right eye a vertical nystagmus. The left eye did not move upward. There was uvular paralysis. Her ears were normal, and her chest and abdomen showed no abnormalities. All of her reflexes were increased. She had athetoid movements of hands and arms, especially when walking. Her legs were spastic, with a plantar flexion of her feet. When she tried to walk she leaned forward, her legs scissored and she would fall sideways, and if she turned suddenly she would fall.

Her pupils reacted to light but not to accommodation, and were equal. There was a positive Babinski and Kernig, especially on the left. An ankle clonus was more marked on the left than the right.

On September 23, 1927, the eye-grounds were reported as clear, and her blood showed 15,000 leukocytes, the spinal fluid normal with eight cells, and a culture of this gave no growth.

Poliomyelitis was discounted, and the impression was a brain tumor.

We did not hear from her again until October 21, 1927, when she died, and a limited autopsy was permitted.

Autopsy.—Dr. A. H. Zeiler found a "glioma of the pons," but unfortunately the specimen was not sectioned.

Summary of Symptoms and Findings.—Internal squint at start, later nystagmus, horizontal and vertical. Incoördination and stumbling gait. Irritability; when sleeping, jerking and quivering. Left facial palsy. Uvular palsy. Increased reflexes. Positive Babinski and Kernig. Left ankle clonus. Clear optic discs. Negative spinal fluid. No vomiting. No complaint of headache.

Predominant Symptoms.—Staggering gait. Characteristics of cerebellar irritation.

* * *

Case 2.—Joe was ten years old when seen, November 7, 1927, in consultation with Dr. L. H. Athon. His past history is unimportant, except that for the last year and a half he would awaken at night and cry out as though scared. Three weeks before our visit he was at school, jumping from one bench to another when he fell and struck his back. Following this he had some headache and vomiting, but not severe. He had some neck stiffness for four days, which gradually disappeared.

He continued in school until the 5th of November when, on starting to a neighbor's house, he vomited profusely, fainted and had convulsions. When taken home and examined by a neighborhood physician, nothing definite was found. He was afebrile. When seen by Doctor Athon on November 6, he had some neckache, headache and drowsiness, but otherwise the findings were negative.

When we saw him his rectal temperature was 98.8, pulse 80, and respiration normal. He was well nourished, his eyes responding to light and accommodation. His throat was clean, and his chest and abdomen were normal. The reflexes were present, but sluggish. There was a definite cervical rigidity, a slight Kernig, and a positive right-sided Babinski. The abdominal reflexes were present. On lumbar puncture about 15 cubic centimeters of bloody spinal fluid was obtained, which was under pressure. Microscopically the blood cells were crenated and no fresh blood was seen. Cultures were sterile. The Wassermann was negative.

An x-ray, November 8, was negative for fracture of the skull. The boy was so restless it was impossible to get good roentgenograms.

On November 9, 1927, a second lumbar puncture was done, which showed crenated red blood cells. November 12, 1927, a third lumbar puncture showed blood-tinged fluid with numerous red blood cells and a negative culture. His urinalyses were always normal, and his blood counts showed white cells 8,500 and 86.5 per cent polymorphonuclears.

On November 9, 1927, Dr. C. W. Rand examined him and reported his findings as follows:

"A conscious boy suffering a severe headache. The head is turned back with stiffness of the neck and a double positive Kernig. A positive Macewen's sign. The pupils are equal and react to light and accommodation. Fundus examination shows: Hyperemic, swollen discs, engorged tortuous veins, no hemorrhages or exudates. No nystagmus. His bladder is full to the level of the umbilicus and on voiding, 475 cubic centimeters of urine was obtained. There are no deep reflexes of the upper extremities, no right knee-jerk, and the left is sluggish."

For the next few days the condition remained about the same. The headache, which was frontal, was at times very severe. On November 12 the left side of the face and the muscles of the left side of the body were weaker than previously. A right-sided cerebral trouble was suspected, possibly a hematoma, or a pachymeningitis interna hemorrhagica. Under anesthesia four trephine openings were made, two on the right and two on the left. No hemorrhage or hematoma was found, but the brain was wet and swollen, more on the right than the left. There was no shock or hemorrhage. On November 13 his hands and feet were in motion almost constantly. He would not talk, but gave clear concise answers when spoken to and said his headache was better. He seemed brighter and looked at the comic papers. On November 14 he was conscious in the morning and looked at the papers, but in the afternoon he became drowsy and said he did not feel so well. At 8 p. m. he became unconscious and had a convulsion.

He presented a typical picture of extensor rigidity. His rectal temperature was 106.7. The pupils were dilating and contracting. There were evidences of great intracranial pressure with midbrain symptoms. As the wounds on the right side of the skull were opened, the brain was seen bulging to the point of rupture, and an attempt to tap the ventricle from both openings failed. On lumbar puncture dark red liquid blood came through the needle. Probably a fresh hemorrhage had occurred at 8 p. m., the origin being undetermined. He died at 10:45 p. m.

Autopsy.—At the autopsy by Dr. W. V. Brem on November 15, 1927, it was reported:

"On removal of the skull cap, the surface of the brain was injected. There were blood clots at the base of the brain extending down the cord. The lateral ventricles both contained blood clots. In the anterior portion of the right frontal lobe there was an area of softening about 5 centimeters in diameter into which there had been a hemorrhage. This area had broken down into the right ventricle. The tissues in it were mushy and apparently degenerated. The walls were formed by soft vascular tissue without any clear line of demarcation from the adjacent brain tissue. No further examination was made."

Diagnosis: Glioma (type not determined). A vessel had ruptured into this glioma, and there was a spontaneous hemorrhage into the ventricular system. Undoubtedly this same condition had occurred a month previously, and then about November 5 and again on the 14th.

Summary of Symptoms and Findings.—Falling while playing. Vomiting and convulsions. Afebrile. Cervical rigidity. Kernig and Babinski positive. Bloody spinal fluid on repeated taps. Severe headache, frontal. Choked discs. Absence of deep reflexes. Negative findings on trephining skull. Terminal extensor rigidity. Terminal hyperpyrexia. Autopsy, right frontal lobe glioma with hemorrhage.

Predominant Symptoms.—Headache. Convulsions. Choked discs. No typical symptoms to suggest localization of tumor.

* * *

Case 3.—Billy W., October 9, 1933, was eight years old. His past history was unimportant, so far as the present condition was concerned. His birth was normal, and he weighed 7¾ pounds.

The complaint was that he did not seem to require as much sleep as most children for his age. He also had had a troublesome cough since the middle of August, and lately this cough had caused some vomiting. There was a slight pharyngitis. A tuberculin test was negative. On October 31, 1933, the mother stated that he was vomiting, either before or after breakfast, daily. He was nauseated when he did not vomit. His eyes were examined by Dr. Frank Miller, who reported a small amount of hyperopia and that the fundi showed no pathology except "engorged and dilated central veins. The significance of this is somewhat questionable. There is no positive evidence in the eyes of any intracranial pathology." He was fitted with glasses, which gave some relief for a time.

Testing his reflexes he showed all apparently active, although in testing the Rhomberg sign he tended to fall to the right. He could hold himself erect if held tensely. His mother stated that on recent occasions when he was down on the floor and rose up quickly, he complained of dizziness. An x-ray of the skull was reported as negative for x-ray evidence of brain tumor. His Wassermann was negative, his blood sugar 70 milligrams per 100 cubic centimeters of blood, NPN 33 milligrams, blood count normal, and a stool examination was negative for parasites or ova. He was given phenobarbital, one and one-half grains daily, with some relief.

On November 7, 1933, he was examined by Dr. C. W. Rand, who commented that percussion note over the calvarium was definitely high-pitched. His complete examination led him to the following impression:

That here was an eight-year-old boy, who had been well up to six weeks previously when, unexplained, he started morning vomiting, a little headache, a little dizziness on stooping, possibly a little unsteadiness at times. He had shown no definite nystagmus or ataxia. There was some overfilling of the retinal veins which was suspicious. From such a history a cerebral neoplasm was suggestive, possibly in the midline or fourth ventricle. The signs and symptoms were, however, not fully developed, and it was considered best to keep the boy under observation.

On December 20 Doctor Rand reported a suggestive Babinski on the left. Also, that the boy complained of "little headaches" which were frontal, and "big headaches" which were over the forehead and both temples.

On January 19, 1934, Doctor Rand stated that during the past month the boy had had periodic headaches, sometimes going a week at a time free, then having them for several days in succession. Sometimes vomiting relieved the headache. He had his glasses refitted again, as there was some increase in the hyperopia. Over the calvarium the percussion note was higher pitched. The veins of the eyelids were beginning to become dilated, and the eye-grounds showed definite choking of the discs. The disc margins were practically obliterated. The veins were overfilled, tortuous, and in some places embedded. Elevation was estimated at from one to two diopters. On looking to the extreme right and left, there was a little unsteadiness, hardly enough to call it a nystagmus. His convergence was poor. All of his deep reflexes were rather sluggish but equal. An equivocal Babinski was present on both the right and the left. In Rhomberg's sign he swayed, but did not fall. He was unable to stand on tiptoe with both eyes open, and was unable to stand on either foot alone with eyes open. His gait was normal.

On February 2, 1934, he was operated on by Doctor Rand, and a medulloblastoma was diagnosed and removed by curettage. He did well, and the first dressing was on February 11, when sutures were removed and the wound was clean. On February 14 he had a slight rise of temperature to 101.4 from a slight acute pharyngitis, which subsided without complications. On February 19 Dr. Orville Meland began x-ray therapy up to the 26th of February over the right and left occipital regions. Five hundred K. V., 4 M. A. 5 mm. brass filter, 50 centimeters distance, giving 900 r over each area with 300 r administered each day. He left the hospital on February 28.

From March 14 to 21 this treatment was repeated, with the same factors of 900 r to each side of the occiput with 300 r each day. From March 6 to 12 he was treated over the spine through three ports for prophylactic reasons, since this tumor implants itself along the cord. Two hundred K. V., 4 M. A. one-half cu. plus 1 m. al., 50 cm. distance, 400 r over each side of three ports, 200 r being given daily. Doctor Meland reported that, following the treatments over the occiput, he developed increased dizziness with vomiting. There was an erythema of the skin with slight epilation. He gradually gained weight. From September 4 to September 24, at Doctor Rand's suggestion, Doctor Meland gave 150 r every other day, 200 K. V., 4 M. A., one-half cu. plus 1 al., 50 cm. distance: 600 r given over each occiput and 400 r over each of three spinal ports.

On November 2, 1934, he was nine years three weeks old; weight, 55 pounds; and height, 51 inches. He had no hair from the level of the upper borders of the ears down over the occipital region, and the hair on top of his head was very fine. He was in grade 3A at school, and the teacher reported he was doing "top work."

On January, 1935, he started to have some numbness in the right hand and arm, and an inability to grasp objects with the right hand, so he had a further series of treatments along the spine, as there was a possibility of metastases, which are the common sequellae of this condition. The early part of March he began to vomit and have a recurrence of headaches. His operative wound showed increased intracranial pressure. He gradually failed, died April 10, 1935, fourteen months eight days postoperative, and seventeen and one-half months from the onset of his first symptoms.

This history is given in detail to show the early signs and symptoms, and how the tumor was diagnosed and the subsequent course. No autopsy was permitted, as the condition was diagnosed by operation.

Predominant Symptoms.—Vomiting. Headache. Choked discs.

COMMENT

In the differential diagnosis one must rule out brain abscess where there is a history of trauma, or ear or mastoid operation, or sinus infection with or without operation, by the acute onset, increase in temperature and a leukocytosis.

Where vomiting occurs daily or at fairly frequent intervals, gastro-intestinal disturbances must be ruled out. The same applies to eye-strain. This will sometimes cause morning vomiting. Always insist on an eye-ground examination when the eyes are being tested.

If, on spinal puncture, the fluid shows old blood, one may suspect a pachymeningitis hemorrhagica, or if there is fresh blood, study the history carefully for trauma.

Where a child presents a gradual increase in irritability from no known cause, such as overfatigue, it is well to study the history carefully. A complete physical examination must be made, including a study of the eye and eye-grounds.

If a child, who has been apparently normal, becomes awkward in the use of his arms or legs, chorea must be considered and ruled out. Here there are usually the involuntary movements so characteristic of chorea. In the brain tumor case, the awkwardness varies when voluntary movements are attempted.

Gastro-intestinal disturbance of a chronic nature may be suspected from the vomiting and headaches. Here, too, the careful history and physical examination and in addition possibly, a roentgen study of the gastro-intestinal tract, will help clarify this.

The prognosis is always poor. Medulloblastomas are highly malignant, and spread through the spinal fluid where they become implanted in the spinal spaces. They are radiosensitive. The postoperative clinical course is from six months to five years.

Treatment is surgical, followed by deep x-ray therapy in the case of medulloblastomas. The surgical mortality is very high. A decompression may relieve the symptoms for a while.

SUMMARY

Any child presenting the following symptoms should suggest a cerebral or cerebellar neoplasm:

Headache, usually more or less constant.

Vomiting which is not characteristic. Occasionally projectile.

Choked discs, which are usually double with optic atrophy later. Vertigo. A slow pulse.

Dullness verging on apathy and somnolence.

General convulsions which are more frequent in cerebral than cerebellar tumors. Progressive downward course. Irritability of varying degrees. Spinal fluid that is usually negative.

Hydrocephalus in the very young, and Macewen's sign.

A careful history must be elicited and the child thoroughly studied. Do not forget that the eye-grounds may show some of the first signs in the fullness of the vessels. Do not consider persistent vomiting or headache as merely a passing condition, but *rule out neoplasm.*

DISCUSSION

Carl W. Rand, M. D. (1023 Pacific Mutual Building, Los Angeles).—Recently Dr. R. J. Van Wagenen and I had an opportunity to review thirty-eight cases of brain tumors in children who had been admitted to the Children's Hospital in Los Angeles. These cases approximately covered a ten-year period and represent a ratio of 0.335 per cent, or one brain tumor in every 298.6 medical admissions. Tumors of the posterior fossa, averaging 60 to 65 per cent of the total, predominated. Tumors of the pituitary gland (except Rathke's pouch cyst), meningiomas and acoustic neuromas, which form a sizeable proportion of intracranial tumors in the adult, do not occur in children. The percentage of gliomas in adults is in the neighborhood of 45 per cent, while in children it would approach 75 per cent. Some 94.7 per cent gave a history of symptoms of more than two weeks' duration. Persistent periodic vomiting was a prominent symptom occurring in 73.6 per cent; failure of vision was complained of in only 18 per cent, but choking of the disc was found in 73.6 per cent. Convulsions were relatively infrequent, comprising 31.5 per cent, while headache was complained of in 63.1 per cent. Midline cerebellar tumors, usually occupying the fourth ventricle, occur most often in children. They are frequently medulloblastomas or ependymomas. Morning vomiting, enlargement of the head and headaches are highly suggestive of fourth ventricle tumors. Gait disturbances usually appear later. These tumors can seldom be entirely removed. Medulloblastomas, however, are quite sensitive to deep x-ray therapy. They tend to implant themselves along the spinal cord, consequently radiation should be directed over the back. A number of children were carried as feeding problems, behavior problems, encephalitis, or neuropathic conditions before the final diagnosis of brain tumor became evident. The main source of error in all cases was failure to use the ophthalmoscope.

⁂

Orville N. Meland, M. D. (1407 South Hope Street, Los Angeles).—It has been known for a long time that nerve tissue is resistant to radiation; consequently there is little danger of doing damage to normal structures while treating brain tumors. The only exception is when using radon seeds inserted directly into the brain, which may be followed by localized edema and necrosis when the dosage is high. Despite the fact that these structures are radio-resistant, it has been known that certain brain tumors are sensitive, namely, pituitary tumors and some gliomata. In this discussion we are not interested in any other types of tumors except those of the latter class. In this group we have the astrocytomas, the spongioblastomas, and the medulloblastomas. The first of these is not sensitive, so I doubt whether any benefit ever accrues from treating this type of tumor; spongioblastomas are moderately sensitive and may respond favorably at times; but the medulloblastomas, a very malignant tumor, is exceedingly sensitive, and usually in this type the radiologist accomplishes a great deal by radiation therapy. Unfortunately, however, this group represents only a small proportion of the whole series of brain tumors.

The third case in Doctor Scott's presentation is very interesting. The immediate results of radiation therapy were very striking, but the ultimate outcome was only temporary amelioration, with exitus in fourteen months. This is the average postoperative life of these patients.

Recently, at the radiological conference, Doctor Leaf of Stanford reported a five-year result in a patient with medulloblastoma, while Doctor Stone of the University of California, reported a similar case which had run two years. The latter patient was interesting, as he had very striking results after therapy; then he began to fail gradually, despite further treatment. Headache and blindness supervened. A second exploration showed no evidence of tumor, but a cyst—which, when evacuated, was followed by immediate improvement. To my way of thinking, the history of the last patient is very instructive, as it points out the fact that there must be mutual coöperation between the pediatrician, surgeon, and the radiotherapist, to assure the patient of a good end-result.

⁂

Howard A. Brown, M. D. (384 Post Street, San Francisco). — Signs of progressive increasing intracranial pressure, such as Doctor Scott has described, must be considered as suggestive signs of brain tumor. In some instances, however, it may be difficult to differentiate between increased intracranial pressure, resulting from brain tumor, and that seen in association with internal hydrocephalus or subdural hematoma. This is particularly true in infants where a gradual increase in the size of the head, enlarging fontanelles and separation of suture lines, with the development of "crack pot" resonance, may be the only signs of early pressure. Choked discs are frequently absent in infants, even in the presence of a high degree of pressure, because of the separation of the sutures which allows for expansion of the intracranial contents.

In cases of this type considerable information can be obtained by careful puncture through the lateral aspects of the anterior fontanel. A subdural hematoma can be located, if present, and the contents of the sac aspirated. If no hematoma is present, deeper puncture into the ventricle gives an estimate as to whether one is dealing with a hydrocephalus or not. If the ventricles are small, air can be introduced and ventriculographic studies made to localize the pathologic process. If a hydrocephalus is encountered, a small amount of a neutral dye may be injected into the ventricle and, subsequently, a lumbar puncture done to determine whether the hydrocephalus is of the communicating or obstructive type. Immediate recovery of the dye in the lumbar region indicates a freely communicative type of hydrocephalus, while failure of the dye to appear below indicates some obstruction to the outflow of cerebrospinal fluid from the ventricular system. The latter group may result from tumors of the posterior fossa or congenital malformations along the pathways of fluid escape from the ventricles and, in the majority of instances, may be relieved by surgical measures.

In our experience, brain abscess seldom gives rise to fever or leukocytosis, except in its early stages before it is well walled off from the surrounding brain. The presence of middle ear or mastoid infections or acute sinusitis preëxisting the signs of intracranial pathology will indicate the possibility of a brain abscess, although in rare instances they may occur without a definite infectious etiologic agent that can be recognized.

It is impossible to determine the type of tumor present until a surgical exposure has been made. The astrocytomas are fairly well circumscribed, and frequently may be removed completely without recurrence. This, of course, is in contrast to the medulloblastomas, which recur after surgical removal. In view of the marked difference in prognosis between the two types, operation is essential to offer a possible permanent cure in the astrocytomas and, at least, a relief of much of the headache and vomiting in the medulloblastomas.

Early recognition and surgical treatment of brain tumors offer a much better prognosis, both as to life as well as the preservation of vision and other special functions which may be permanently damaged by prolonged increased intracranial pressure.

Doctor Scott has called attention to the importance of a careful history and examination in cases presenting the symptoms of intracranial pressure which he has described. By such efforts, I am sure that our ability to diagnose and treat such conditions in the future will steadily increase in efficiency.

RELAPSING FEVER IN CALIFORNIA*

By G. Creswell Burns, M.D.
Walnut Park

Discussion *by Robert T. Legge, M.D., Berkeley; LeRoy Briggs, M.D., San Francisco; Howard O. Dennis, M.D., Beverly Hills.*

RELAPSING fever occurs in many portions of the world. The existence of the disease has been known for centuries. Hippocrates described an epidemic of relapsing fever in Thasos. In 1741 Rutty observed a disease with relapses associated with typhus fever in Dublin. Livingston, in 1857, described a peculiar relapsing fever in South Africa, which he stated the natives considered to be carried by ticks. Then, in 1868, Obermeier observed a large spirillum in the blood of a patient, and an epidemic in Berlin in 1872 gave him the opportunity to confirm his observation in a number of patients. His findings were published in 1873.

In North America the disease was first recognized clinically in 1844 during an outbreak in Philadelphia, and was thought to have been brought into this country by Irish immigrants. In 1874 an epidemic of relapsing fever was observed among some Chinese laborers in Oroville, California.

Asiatic relapsing fever, which is louse-borne, is endemic, but at times becomes epidemic in European Russia, Poland, and the Balkan States. Sporadic cases and mild epidemics occur periodically in China, India, and north and west Africa. During the World War there was a severe epidemic in Serbia. In 1922 and 1923 there was an outbreak in the Gold Colony in west Africa.

Tick-borne relapsing fever, known as African relapsing fever, is present in southern, eastern, and a portion of central Africa. This variety of the disease occurs sporadically in Southern California and Mexico, and is endemic in Central and South America, Spain, Palestine, and Persia, but this type of the disease rarely becomes epidemic in character.

In September, 1922, Briggs[1] of San Francisco reported two cases of true relapsing fever, contracted by a man and his wife at Polaris, on the Truckee River. These are the first proved cases of relapsing fever arising from a focus in this State. Meader's[2] five cases in Colorado, which he reported in 1915, were the first proved instances of relapsing fever arising from an endemic source in the United States. Up until 1915 there had been a few scattered cases reported by the following observers:[3] Ward (1900), Tuttle (1906), Carlisle (1906), Goldfarb (1908), Hunter and Cope (1909), and Christian (1911). These cases, nine in number, occurring from 1900 to 1911, were all limited to direct importation—from Armenia, from eastern tropical America, from Turkey, from Russia, and from Macedonia.

Two years after Meader's report, Waring[4] reported another case in a boy who came from the same locality as Meader's patients. From 1917 until 1922, when Briggs called attention to his cases, there was in the "Index Medicus" no reference to relapsing fever in the United States.

---

* Read before the Medical Section staff meeting of Los Angeles County General Hospital, January 28, 1935.

The first diagnosis of relapsing fever occurring in Panama was made in 1905. From that year until 1930 one hundred and seventeen cases were diagnosed at the Canal Zone Hospital.[5] The occurrence of the disease in Texas was reported by Kemp, Moursund, and Wright[6] in January, 1933. The first report of cases in Canada was made by Palmer and Crawford[7] in June of the same year.

In California no case of relapsing fever came to the attention of the State Board of Health from 1921 (the date of Briggs' cases) until September, 1930, when Dr. George Stevens[8] of the Los Angeles City Health Department reported a case in a school teacher who had lived at Big Bear Lake during July and August. The California State Department of Public Health up to November, 1932, however, had recorded thirty cases of relapsing fever. Varden's case[9] (reported in CALIFORNIA AND WESTERN MEDICINE, May, 1932), is included in this report. Legge[10] reported a case in May, 1933, and Coleman,[11] in December, 1933, reported the occurrence of the disease in himself, acquired accidentally through inoculation. These last two cases are also included in the California State Department of Public Health report of November, 1932.[8]

Up to January 1, 1935, a total of eighty-six cases of relapsing fever had been reported to the State Department of Public Health.[12] In the year 1933 there were nineteen, and in 1934 there were thirty cases.

California cases by geographic location according to counties are:

El Dorado and Placer	32
Mono	1
San Bernardino	46
Sierra	2
Tuolumne	1
Source out of the State (Nevada, 2; New Mexico, 1)	3
Laboratory infection	1
Total	86

CLINICAL FEATURES

True relapsing fever is an acute infectious disease caused by a spirochete of the genus Treponema. The disease is characterized by paroxysms of fever lasting from three to six days, with an afebrile interval lasting about a week.

ETIOLOGY

Borrelia recurrentis is the name given to the organism causing European relapsing fever. Other strains have been thought to exist, and various strains have been studied in the different localities throughout the world where the disease has been isolated. Coleman,[13] in his experimental work on relapsing fever in California, concluded that the three California strains which he has in his possession are probably identical. He believes that the Novyi and Dutton spirochetes appear to belong to different groups from the California spirochetes, though there may be some relation between the California and the Novyi strains. The tamarack gray squirrels and chipmunks are the animals which harbor the spirochetes in California, and the tick Ornithodorus is responsible for the transmission of the spirochetes to man. The mode of infection is contamination, the coxal fluid and feces of the tick being rubbed into the skin of humans. It seems that a bite is not necessary to effect transmission. The list of animals in various localities throughout the world which have been shown to be infested with the spirochetes of relapsing fever is large, including the armadillo, opossum, and dog. Curiously enough, the California ground squirrel is immune.

SYMPTOMS

The incubation period is usually less than twelve days; the average, seven. Prodromal symptoms are unusual, but in some cases the onset of the disease may be marked by menal depression, inactivity, slight shivering, and sweating. The onset of the attack is sudden with a chill or, as is usually the case, a chilliness lasting several hours. The fever mounts quickly and there is severe frontal headache with nausea and vomiting. Spells of shivering may be prolonged and vomiting often is severe. Pain in the epigastrium and in the region of the liver and spleen may be a complaint. Generalized muscular and joint pains may become excruciating. In young persons there may be convulsive seizures. The temperature becomes high, to 104 and 105 degrees Fahrenheit. The pulse is alarmingly rapid. Jaundice has been reported as a common symptom in some epidemics. Cough is often a symptom. The patient appears prostrated, the face is flushed and may be cyanotic. The temperature remains high for a few days—three to five or six, with irregular fluctuations. The skin is usually dry and hot. Nose-bleed is frequent, and there may occur hemorrhages into the skin, into the conjunctiva, from the ears and from the gastro-intestinal tract. The patient may become delirious. A macular eruption sometimes appears over the thorax, abdomen and legs, lasting a few days. The spleen is enlarged and tender; likewise the liver. Herpes is common. The urine is high-colored and contains albumen.

At the end of the paroxysm the temperature drops suddenly. With this come a profuse perspiration and a feeling of great relief to the patient. The appetite returns and the patient soon feels well again. There is an apparent recovery which lasts for approximately a week. Then a relapse follows with a sudden return of all the acute febrile symptoms. Occasionally there is recovery after one attack of fever. Untreated, the disease will usually run through a varying number of relapses. Instances of many relapses have been recorded. Osler[14] says that a second and third may occur, and that there are instances on record of a fourth and fifth. Whitmore,[15] writing in "Tice's System of Medicine," states that in about two-thirds of the cases one relapse ends the disease, that a second relapse is not uncommon, that a third and fourth relapse are much less common, and that very rarely are there more than four relapses. St. John,[16] writing in Cecil's "Textbook of Medicine," says that a second relapse is uncommon, a third rare. In the California cases there were several cases with four relapses, a few with five, one with eight relapses, and one patient continued to have febrile attacks every ten days from August of one year until March of the following. Clinical records of only thirty of the eighty-six California cases were available for reference.

At times the symptoms during the relapses may be more severe than during the original attack; but as a rule they are less severe and of shorter duration.

DIAGNOSIS

The diagnosis is established by finding the causative organism in the blood during a paroxysm. The spirochetes may be found by examination of a fresh drop of blood or in stained smears. The ordinary Wright's stain will suffice. In mild attacks the spirochetes may be so scanty as to be readily missed.

DIFFERENTIAL DIAGNOSIS

Sporadic cases of relapsing fever are frequently confused with malaria. But in the former the afebrile interval between paroxysms is usually longer, and there is a leukocytosis, while in the latter there is generally a leukopenia. Dengue fever is differentiated by a leukopenia and an absence of spirochetes in the blood. Smallpox, influenza, and yellow fever have to be differentiated. The early stages of plague may be confused with relapsing fever. The enlarged spleen speaks against smallpox, influenza, yellow fever, and dengue. During epidemics typhus fever may cause confusion. Undulant fever needs to be differentiated. In children acute gastro-intestinal disturbances, pyelitis, early pneumonia, may be the first conditions to be considered. The polymorphonuclear leukocytosis is apt to be more confusing than it is a help.

COMPLICATIONS

In California the complications have apparently been slight if not nil. But in severe epidemics abroad serious complications have occurred. Bronchitis and pleurisy are fairly common. Pneumonia may develop. The spleen may rupture. There may occur cerebral hemorrhage or thrombosis. Heart failure and nephritis may follow prolonged relapses. Iridocyclitis is fairly common.

PROGNOSIS

Before the introduction of salvarsan treatment of relapsing fever, the mortality from the disease was from 2 to 5 per cent. In China and Indo-China the mortality often has been as high as 25 to 40 per cent. In the epidemics in India and China in 1912 -1913, the mortality was as high as 70 to 80 per cent. Most of the deaths are due to complications. Children and adults in good physical condition do not often develop complications.

TREATMENT

Prophylaxis is of value in prevention of the disease, especially in conditions of filth and famine. In California, in the mountains, modern living conditions generally prevail in the cabins and cottages. The ticks are part of the great outdoor life, and their presence need not necessarily signify the existence of unhygienic conditions. Nevertheless, prophylaxis should be aimed directly at removing the spirochetes from man, as a source of infection, by curing the patients as soon as possible, and by protecting persons from the bites of bedbugs, lice, and ticks.

Specific treatment consists of giving arsphenamin or neoarsphenamin. St. John [16] states that in fully 80 per cent of cases the intravenous injection of 0.3 gram of salvarsan or 0.45 gram of neosalvarsan will end the infection. It is advisable not to give too large doses, since relapsing fever lowers the resistance of the patient to the toxic properties of the drug. Best results are obtained if the drug is given early in the disease and at the onset of a paroxysm. For a child of seven, an injection of 0.15 gram of neoarsphenamin should ordinarily be well tolerated.

General measures are those employed in the treatment of other acute infectious diseases.

REPORT OF CASE*

The patient is a boy, seven years old, who contracted relapsing fever at Big Bear Lake in San Bernardino County. He had four relapses, one of these occurring after specific treatment had been instituted.

The patient has had measles, chicken-pox, and whooping-cough. The latter disease, which occurred at the age of seventeen months, left him with certain allergic tendencies. Each upper respiratory infection would be accompanied by considerable asthmatic wheezing. In April, 1934, the patient was in a hospital because of bronchial pneumonia, verified by x-ray. The rest of the history is irrelevant.

The patient left home June 28, 1934, with three other children to spend the summer in a modern cottage at Big Bear Lake. On July 8, ten days after arriving in the mountains, quite by accident it was discovered that he had a temperature by mouth of 99 degrees. The next day the patient complained of malaise, headache, and was feverish. The local physician was called in to see the patient the following day because his temperature had gone to 103 degrees Fahrenheit (by mouth). The patient vomited several times, complained of severe headache and epigastric pain. He was brought home from the mountains July 10, and the following day contined to be nauseated and vomited once. His temperature had come down, and by July 12 he was feeling well again, appetite had returned, and he was ready to get out of bed. But he was kept quiet for another day. On July 14 he was out riding his bicycle, and apparently had recovered from the acute illness. It was felt that the condition was either an acute respiratory infection or an acute gastro-intestinal disturbance. Coming in the midst of an epidemic of poliomyelitis, this disease was also borne in mind.

On July 19 at three o'clock in the morning the patient awakened and complained of feeling hot. He was perspiring. He was given five grains of aspirin, and he fell asleep. At seven o'clock in the morning his temperature was 102 degrees Fahrenheit. That afternoon the temperature was 104.6 degrees. It dropped some during the night, and the next morning, July 20, at ten o'clock his fever was 105.2 degrees Fahrenheit.

---

* Editor's Note.—Report of case is that of the author's own son.

The patient was prostrate, complained of severe headache and epigastric pain, with soreness in the upper left quadrant of the abdomen. He had a dry cough and his nose bled. Physical findings, as previously, were essentially negative, with the exception of tenderness on palpation in the region of the spleen, though no enlargement of that organ could be detected. A glass of hot lemonade with whisky seemed to be what induced a break in the fever, for in two hours his temperature was down to 100 degrees. The patient perspired profusely. As his temperature was rising during the morning hours, the patient had complained of feeling cold, but at no time during the initial attack or during any of the relapses had there been a definite chill. He felt well again by July 22 and was soon up and about, playing. He was taken back to Big Bear Lake on July 28 and had another recurrence of fever to 104.6 degrees the following day. His temperature the evening of July 29 was 96 degrees, recorded after several hours of profuse sweating. The patient was brought back home again the following day, July 30. His temperature rose again to 103.6, and a blood count done then was: hemoglobin, 80 per cent (T.); erythrocytes, 5,000,000; leukocytes, 14,400; with 75 per cent polymorphonuclears, 9 per cent mononuclears, and 16 per cent lymphocytes. The neutrophils were adult in form. Urinalysis was negative, with the exception of a faint trace of acetone.

Relapsing fever of some nature was obviously by now the clinical diagnosis. A sample of blood was taken for agglutination test. This was reported negative for typhoid, paratyphoid A and B, but was positive for mellitensis in strong dilution (1 to 20). The following day, July 31, three white mice were inoculated intraperitoneally at the bedside, each with one cubic centimeter of the patient's blood.

The patient again had an afebrile interval and felt quite well. Two of the mice became ill on the sixth day after inoculation, and were examined the afternoon of August 7. That evening the patient complained again of malaise, and the next morning, August 8, at eight o'clock his temperature was 102 degrees. Blood smears were made at the beginning of this relapse and were positive for spirochetes. The blood from two of the inoculated mice also was positive for the spirochetes of relapsing fever. A small dose of neoarsphenamin, 0.03 gram was given intravenously to the patient at ten o'clock, August 8. This dosage was decided upon after reference to the article by Legge, in which he stated that this amount of the drug had been effective for his patient, who was an adult. Later it was concluded that in Legge's article there had been a typographical error and that what his patient actually received was 0.3 gram and not 0.03 gram of neoarsphenamin. The afternoon of the day the patient was given this small dose of neoarsphenamin his temperature reached 103.4 degrees. The next day his temperature climbed to 105.4 degrees, with all the previous symptoms and findings present, but on August 10, the following day, his temperature did not go above 98 degrees. It had been planned to wait four days before repeating the neoarsphenamin, but on the third day following the initial injection another unexpected relapse took place, patient's temperature mounting to 105.2 during the night. He again felt quite well the next day, though by now he was looking quite pale and worn out as the result of the repeated febrile attacks. On August 13 he was given 0.15 gram of neoarsphenamin intravenously, and this dose was repeated in four days. On the day his fifth relapse would have occurred, his temperature rose to 99 degrees. On August 21 he was given another intravenous injection of neoarsphenamin, the dose this time being 0.1 gram. He was allowed to return to Big Bear Lake the following day, where he remained symptom-free and quickly regained his lost weight and strength.

COMMENT

The small initial dosage of neoarsphenamin produced a reaction similar to a "provocative." Until this intravenous injection was given, the relapses were occurring at regular ten-day intervals, but this injection apparently was responsible for precipitating the unexpected relapse which followed two days after the peak of the last febrile attack. Perhaps the second dose of 0.15 gram would have sufficed to prevent further relapses, but to make certain that the blood stream was rid of the spirochetes a third injection was felt advisable. The child received a total of 0.45 gram.

None of the other children or adults in the cottage contracted the disease, but a five-year-old girl, living for the summer in a cottage about one hundred yards away, also developed the disease. The diagnosis was made by Doctor Varden of San Bernardino. It was learned that a girl of three, staying for the summer in a cottage just next door to the cottage where the patient was living, had contracted relapsing fever three years previously.

Miss Dorothy Beck of the California State Board of Public Health conducted a search of the cottage for ticks and other insects. Some ticks were found in the vicinity of the cottage, but whether they were Ornithodorus moubata or some other species I am not able to state. Miss Beck informs me that the ticks have not been classified as yet.

I have learned from Miss Beck that practically all of the San Bernardino County cases have come from the vicinity of Big Bear Lake.

In conclusion, I should like to say that the question of latent infection is apt to be of some concern, but in this regard Coleman[11] has concluded, from his experimental work on mice, that the brain was never virulent unless the blood was. He attempted to reactivate spirochetes in mice which had apparently recovered recently or after a long interval, and no reinfection was revealed.

DISCUSSION

Robert T. Legge, M. D. (University of California, Berkeley).—Our State has had several diseases that are essentially Californian, *e. g.*, tularemia, coccidiosis, and relapsing fever. It was due to members of this society and investigators within our State that these diseases were either definitely determined as entities or their relative causes discovered.

The medical and public health professions at the moment are much concerned as to the number of cases of relapsing fever that are being reported. Investigations have shown that this disease is endemic in California.

Physicians, therefore, must be on the alert and suspicious of certain fever patients, especially those living within endemic areas, or who have visited there. The diagnoses can be determined positively by clinical laboratory examinations of blood smears taken when the patient has temperature, for the presence of spirochetes, and by mouse inoculation as pointed out by Doctor Burns, as these animals are highly susceptible to the disease.

In my case, reported in this Journal, May, 1933, the patient, Mr. C. M. Wheeler, M. S., a graduate student with Doctor Herms, doing research in medical parasitology at the University of California, who was accidentally infected while engaged in field work, is now a candidate for a Ph. D. degree. His thesis is to be on experimental evidence as to the vector that causes relapsing fever. This scientific piece of research will throw much light on an important subject.

The habitat of this rodent parasite is found usually in high altitudes, a significant fact, as most of the cases reported came from such endemic areas as Big Bear Lake and other Sierra regions. Herms, Meyer, and Wheeler have positively recovered this parasite in chipmunks' nests, and have incriminated the vector now known as Ornithodorus hermsi, so named after Professor William B. Herms of the University of California.

⁂

LeRoy Briggs, M. D. (384 Post Street, San Francisco). Relapsing fever yearly is becoming more of a vacational health problem in an ever-increasing area throughout the West, and continued reference to it by local authors is necessary to make us diagnostically conscious. Not that the disease is a serious one, since the mortality so far has been nil; but early recognition and treatment is essential to cut down the period of disability. In regard to the physical findings as outlined by the author, experience has shown that in the mild variety we have here in California, eruptions are rare—herpes occur only in about 14 per cent, and splenomegaly in 33 per cent.

In the transmission of the disease a proved vector has at last been found[1] as a new species of Ornithodorus tick. Specimens of this were collected from the two larger endemic centers, and monkeys and mice successfully inoculated by allowing the ticks to feed upon them. In honor of Professor Herms, the name "Ornithodorus hermsi" has been proposed for this species. It must be repeatedly emphasized that in the minds of the laity the word "tick" is ineradicably associated with the "wood tick" of the genus Dermacentor, whose habits of feeding are so different from the Ornithodorus. The latter drops off after feeding and, with the exception of O. coriaceus or the pajaroello, leaves no particular lesion at the site of the bite, while the Dermacentor is found embedded in the skin. Furthermore, the larval and nymphal stages are capable of transmitting the disease, yet are so small as to be nearly invisible. These facts must be considered in the proper evaluation of the usual history of "having seen no ticks or bites."

The chief hope for prophylaxis lies in an attack on the rodent reservoir. The tick vector is so rarely discoverable we do not know whether man to man infection via vector plays a part; but we do know that certain rodents, such as chipmunks and tamarack squirrels, are widely and constantly infected. These can be destroyed, and steps are now being planned for control measures around the major endemic centers through the joint action of the Federal Government and the State Board of Health. It is to be hoped that the sentimentality of certain "nature lovers" will not be allowed to interfere with this step forward.

⁂

Howard O. Dennis, M. D. (Beverly Professional Building, Beverly Hills).—Doctor Burns' paper again emphasizes the fact that relapsing fever has become a diagnostic problem in California. This is true particularly in the summer months, when vacationists travel to the higher altitudes, where reservoirs of the infection have been found to exist.

In Southern California, Big Bear Valley has been the source of practically all of the cases. Only one case has been reported from Lake Arrowhead. It is important, therefore, to stress the value of a history of having visited in such areas approximately a week before the onset of the symptoms. Such a history in cases exhibiting signs of an acute infection as that which Doctor Burns has described, should at least raise the question of relapsing fever as a possibility.

My personal experience has been limited to one case from this area. This patient demonstrated the difficulty in finding the organisms in some cases despite careful study of a large number of smears made at the onset of each of several paroxysms. The ultimate diagnosis was made on the finding of but two or three spirochetes in one of several slides. Unfortunately, mouse inoculation was not done as early as would be the case should similar circumstances again develop. In view of this difficulty, mouse inoculation is to be resorted to as soon as a suspicion of this condition has been aroused.

In Doctor Burns' case report he mentions the positive agglutination of mellitensis in a dilution of 1-20. As undulant fever is considered in a differential diagnosis, such a finding might indicate that one were dealing with an infection due to this organism. It should be pointed out that a diagnosis of undulant fever should not be made unless a positive reaction in a dilution of approximately 1-1000 is found. Positive reactions of 1-20 and slightly higher are frequently found in individuals for a period of several years after the original infection with mellitensis has occurred. A recent check on Doctor Burns' child shows the reaction now to be negative.

California cases reported to date during 1935 are as follows: El Dorado County, two; Nevada County, one; San Bernardino County, four; Tuolumne County, one; State of California, one.

The patient from the State of California had been traveling through the Sierra Nevada mountain area and into Nevada; therefore, exact source of infection could not be determined, and the case was charged to California as a whole.

In addition, the names of seven other patients with diagnosis confirmed by laboratory findings have been reported, but sufficient data have not been received to determine localities in which infections were contracted. These seven were not included in the above tabulation; hence, the total for the year to date is sixteen cases. There have been no deaths.

Certainly, it has been shown by Doctor Burns' paper, and the paper of Dr. LeRoy Briggs earlier in the year, that the incidence is great enough to impose upon practicing physicians a definite responsibility for the diagnosis of relapsing fever which cannot be underestimated.

THYROID GLAND ABLATION*

ITS USE FOR CONGESTIVE HEART FAILURE AND ANGINA PECTORIS, WITH A REPORT OF FIVE CASES

By J. H. Pettis, M.D.
and
E. D. Sorsky, M.D.
Fresno

Discussion *by Arthur L. Bloomfield, M. D., San Francisco; William Dock, M. D., San Francisco; R. Duffy Friedlander, M. D., San Francisco.*

SINCE the introduction of total ablation of the thyroid gland for congestive heart failure and angina pectoris, there has been much contradictory comment. The encouraging reports of Doctors Blumgart, Levine, and Berlin have not been entirely duplicated in other clinics. This new therapeutic procedure is at present receiving clinical trial in various centers. The ultimate acceptance or rejection of removal of the thyroid gland in the treatment of this particular group of patients will depend on the final interpretation of the reports from these various centers. The present report is merely the presentation of our results in the application of total ablation of the thyroid gland in five patients. It will not attempt to analyze the physiologic, biochemical, or theoretical aspects involved in this study.

CLINICAL MATERIAL FOR THIS STUDY

Since first undertaking this study in January, 1934, we have seen approximately one hundred and fifty patients suffering from cardiac disease. Of this group we have selected five for the application of total thyroidectomy. The fact that only these few cases were considered suitable for surgery emphasizes the extreme limitations of this new procedure. In the large number of cardiac patients our present medicinal armamentarium is entirely, or at least partially, effective in sustaining a sufficient cardiac reserve. It is in the remaining cases that the application of this newer surgical measure is to be considered. It is in these patients, in whom all therapeutic measures have failed to increase adequately the cardiac efficiency to a degree comparable to the demands placed upon it, that we turn to a method for reducing the load upon the circulatory mechanism. We are thus dealing with a very select group, a group who, according to the therapeutics heretofore available, were doomed to an early death. It is only a portion of this group who may expect beneficial results from removal of the thyroid gland. It is obvious that in the individual with a complete loss of cardiac reserve, even under a markedly diminished load (bed rest), no satisfactory result can be expected from a further slight reduction of the metabolic requirements. Thus, it is apparent that these cardiac invalids, whose lack of reserve necessitates constant bed rest, are unsuited to this new procedure. The greater number of pathologic affections of the heart are progressive. The lessening of the burden placed upon the heart (as by removal of the thyroid gland) may only partially limit this progression. This fact places yet another restriction upon our selection of patients. It necessitates a heart reserve which will permit efficient cardiac function with the passage of years, in spite of the naturally progressive character of the pathologic process in the heart. A consideration of the above facts emphasizes the limitations of the field of usefulness of removal of the thyroid gland in cases of congestive failure.

OPERATIVE PROCEDURE

In carrying out the operative procedure, we have largely followed the technique as recommended by Berlin in his original communication. We have found, however, that cervical block anesthesia has, in our hands, been superior to general or local infiltration anesthesia.

The following are the brief case histories of the five patients upon whom we have performed total ablation of the thyroid gland.

Case 1.—A. Du B., white, male, aged 53 years, was seen in this hospital on four occasions. At each of these admissions, patient was suffering from congestive heart failure. On his last entry the patient showed marked pitting edema of the lower extremities, generalized anasarca, enlarged liver, and orthopnea. Auricular fibrillation was present. Past history was insignificant; there was suggestive history of rheumatic fever in childhood. Patient's occupation was that of laborer. Since onset of present illness two and a half years previous, there has been a limitation of the patient's capacity for work. For the six months preceding his last entry into the hospital he had been unable to perform any physical labor. A diagnosis of auricular fibrillation, and mitral stenosis and insufficiency on a rheumatic basis was made. Because of the inability of the usual therapeutic measures to maintain the cardiac balance, total thyroidectomy was decided upon. At the time of operation on January 19, 1934, the patient's condition was considerably improved, although he was unable to arise from bed. Basal metabolic rate was normal. Following operation the patient became progressively worse. Edema returned to the lower extremities, dyspnea became marked, heart action became extremely rapid and weak. The patient died of cardiac failure on the third postoperative day.

Comment: It was following our failure in this case that we began to appreciate the extreme limitations of this new therapeutic measure. This first mortality was undoubtedly due to improper selection of the case. The cardiac reserve was so depleted that the added shock and burden of surgery was too great. In order to be eligible for this operation the cardiac sufferer must have such a cardiac reserve as will enable him to accomplish certain limited activities. The exact definition of these reserves is at present uncertain. It would seem, however, that as a minimal requirement, the subject must possess such cardiac reserves as will enable him to be ambulatory.

* * *

Case 2.—A. P., white, male, aged 53 years, was entered in this hospital on three occasions, each entry being for congestive heart failure. The patient showed marked pitting edema of lower extremities, right pleural effusion, orthopnea, and enlarged liver. Wassermann test had been positive, but patient had received adequate antiluetic treatment. Blood pressure, 130/80. Diagnosis was made of congestive heart failure, as result of double mitral disease. Basal metabolic rate

---

* Read before the General Medicine Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13-16, 1935.

was normal. Past history revealed single indefinite attack of rheumatic fever in childhood. The patient was a rancher, and before onset of present illness a year previous, had been engaged in hard physical labor. The usual medicinal measures had proved unsuccessful in maintaining an adequate cardiac balance. Because of this, total ablation of the thyroid gland was suggested. At time of operation on March 23, 1934, patient was ambulatory and able to perform slight tasks on the ward. Following surgery there was uneventful convalescence.

Since time of operation this patient has been receiving maintenance doses of digitalis, and has been enabled to return to moderate physical activity on his ranch. He has shown no symptoms of congestive heart failure. The hypothyroid state has caused no undesirable symptoms other than an increasing obesity, which was controlled by small doses of thyroid extract. At the present time, thirteen and a half months after operation, the patient's condition is good. His B. M. R. is minus 29. The results in this case are extremely satisfactory. But for this operation, we feel this patient would have been unable to return to any useful occupation without the production of congestive failure. The production of a hypothyroid state has not resulted in any deleterious symptoms.

* * *

Case 3.—W. P., Italian, male, aged 45 years, was admitted to the hospital on May 8, 1934. At time of entry patient was suffering from congestive heart failure, severe angina pectoris, and hypertension. History revealed presence of severe anginal attacks of eight months' duration, and congestive heart failure of four months' duration. The patient had a single mild attack of acute rheumatic fever. He had been engaged in strenuous labor since youth. Attacks of severe anginal pain had necessitated abstinence from hard labor, and congestive failure had made bed rest necessary. Physical examination revealed slight pitting edema of lower extremities, enlarged liver, and orthopnea. Blood pressure was 183/100. Basal metabolic rate was normal. A diagnosis of hypertension, angina pectoris, and double mitral disease with congestive failure on rheumatic basis was made. At time of operation on May 18, 1934, the patient was able to be up and about. He could perform slight physical exertions without cardiac embarrassment, although severe anginal attacks still persisted. Convalescence following total ablation was complicated by partial atelectasis of right lung. The patient recovered satisfactorily, and was discharged June 1, 1934, on maintenance dose of digitalis.

Comment: Since operation twelve months ago, patient has had no recurrence of congestive failure although engaged, contrary to our advice, in strenuous labor. Severe anginal attacks have never recurred, notwithstanding patient has occasionally had slight substernal discomfort. The place of total thyroidectomy in the treatment of angina pectoris is still in question. The reports of observers in the East are indeed encouraging. But whether this procedure will supplant our other methods of surgical interference in angina pectoris is yet to be determined. No abnormal symptoms of the hypothyroid state have appeared other than mild obesity. This has been controlled by small doses of thyroid extract.

* * *

Case 4.—N. S., white, male, aged 58 years, was admitted to this hospital on three occasions. On each of these entries the patient showed marked congestive heart failure. Past history revealed the presence of congestive symptoms for the past four years. There was no definite history of rheumatic fever. The patient was a farmer and had been engaged in moderately strenuous labor. Physical examination revealed marked pitting edema of the lower extremities, generalized anasarca, orthopnea, enlarged liver, and Cheyne-Stokes' respiration. The x-ray showed a markedly enlarged heart whose transverse diameter measured 19.5 centimeters, approximately 64 per cent of the interthoracic diameter. An electrocardiograph gave definite evidence of an old coronary occlusion, left branch. Blood pressure was 124/64. Basal metabolic rate was normal. Diagnosis was made of double mitral, and double aortic valvular disease with congestive heart failure on rheumatic basis. Following usual medicinal therapy, patient improved sufficiently to permit the performance of slight tasks about the ward. Total thyroidectomy was decided upon and was performed on September 1, 1934. Convalescence was uneventful and patient was discharged on October 18, 1934. He was given maintenance dose of tincture digitalis.

Comment: After discharge, this patient was fairly comfortable for seven months, and was able to do light work. He then reëntered the hospital with signs and symptoms of a recurrence of congestive failure. He has now been in bed for one and one-half months, without improvement. It is probable that in this case the pathologic process of the heart was rather rapidly progressive, and that the heart has now reached the stage where it is unable to meet the metabolic demands of the tissues, even though this demand has been greatly decreased by the hypothyroid state.

* * *

Case 5.—A. G., white American, male, aged 52 years, was seen in this hospital on three occasions. The last entry, November 12, 1934, was for congestive heart failure. At this time the patient complained of dyspnea, cough, irregular heart action, slight edema of ankles, and pain in the left chest. He was a farmer. The past history revealed acute rheumatic fever at twenty years of age. Congestive heart failure was first noted in 1928. Since that time the patient has had about five attacks of congestive heart failure. He has also had bronchial asthma for about ten years. Diagnosis of congestive heart failure with auricular fibrillation on a rheumatic double mitral disease was made. Bronchial asthma was also present. Blood pressure was 123/76. Serology was negative. B. M. R. was normal. Complete thyroidectomy was decided upon because of failure of usual therapy in maintaining suitable cardiac reserve. This was performed on December 26, 1934. Patient had uneventful convalescence, and was discharged with maintenance dose of tincture of digitalis on January 6, 1934.

Comment: Since time of operation the patient has been free of any untoward cardiac symptoms. He has had one attack of bronchial asthma, for which he was hospitalized for a period of about two weeks. The hypothyroid state has produced no distressing symptoms. The patient has not as yet returned to active physical exertion.

COMMENT

We have merely attempted, in the discussion of these five patients, to present our experience in the application of total thyroidectomy in certain types of heart disease. We wish to add these few case reports to the rapidly accumulating literature on this subject. The correct evaluation of this new procedure will depend upon the final analysis of all the reports from the various centers. In order that these reports may be suitable criteria upon which to base final judgment, we wish to emphasize the extreme care necessary in the selection of these cases. Improper selection of patients will bring undeserved discredit to this new surgical procedure. We feel that the experience gained thus far in the application of total thyroidectomy warrants its further trial.

1759 Fulton Street.

DISCUSSION

Arthur L. Bloomfield, M.D. (2398 Sacramento Street, San Francisco).—Everyone has been interested in the work of Blumgart and his associates on total thyroidectomy for heart disease; the results reported by the Boston group being undoubtedly impressive. It must be remembered, however, that this work has been done by experts in a large metropolitan clinic, and the question at issue really is whether the general practitioner, who is neither a cardiologist nor a specialist in thyroid surgery, can serve his patients equally well. The careful work of Doctors Pettis and Sorsky is an excellent example of what the procedure may be expected to do in the hands of doctors as a whole. They wisely emphasize the point at issue: do the benefits outweigh the hazards of operation and the difficulties of controlling postoperative myxedema? It must be recalled that extirpation of the gland is only the beginning; many of the patients may require a delicate and difficult adjustment of thyroid dosage to preserve lowered metabolism, and at the same time to avoid the discomforts of extreme hypothyroidism. In our experience the choice of subjects is not easy. One hesitates to proceed when the patient is doing fairly well with ordinary cardiac therapy; whereas if he is in extremis, the hazards of operation are too great. We doubt if total thyroidectomy will ever have a very wide application in the treatment of heart failure.

⁂

William Dock, M.D. (2160 Pacific Avenue, San Francisco).—Doctors Pettis and Sorsky present a report of carefully conducted exploration of a new therapeutic method. The thyroidectomies performed for heart disease must, like those for hyperthyroidism, produce a permanent and marked fall in basal metabolism. A slight or a temporary fall indicates failure, yet the parathyroids and recurrent laryngeal nerves must be conserved. It is apparent that the authors have correctly applied the method to produce these ends, and that in three of five cases the result justifies the treatment. Improvement, which could scarcely be expected from any other treatment, has followed. In our clinic only three patients, all suffering from angina, were found to be good candidates for this procedure. The basal rate on one was normal, and the operation was therapeutically a complete success; in the other two the basal rates were found to be minus 23 and minus 30 per cent, and the operation was not performed. It is my feeling that this treatment will be found of value in angina and in mitral stenosis, but only a small per cent of those with heart disease will be suitable subjects for thyroidectomy. In those only who are able to be comfortable with bed-rest thyroidectomy, this must be considered as offering some hope of a more prolonged active life.

⁂

R. Dufficy Friedlander, M.D. (University of California Medical School, San Francisco).—In the small number of cases selected by Doctors Pettis and Sorsky, the results are comparable to those obtained elsewhere following total ablation of the thyroid gland for heart disease.

Thyroidectomy for heart disease is still being tried by our various confrères, as evidenced by a recent paper by Bankoff to London and Manchester (Arch. f. Klin. Chir., February 20, 1935), who not only reports excellent results in cardiacs following total thyroidectomy, but equally successful results following subtotal thyroidectomy in patients with paroxysmal tachycardia, neurasthenia and cardiac asthma. The latter procedure must certainly be looked upon with question at the present time.

The results reported by the original workers in this field (Blumgart, Levine, Cutler, Berlin, et al.) have been very encouraging in their follow-up studies for the first year, and it will undoubtedly be very enlightening to see the results of further follow-up examinations in the future. At the present time, Levine is certainly not so enthusiastic about this form of treatment in congestive failure as he was originally. He believes that no cardiac should be subjected to the operation who can be made comfortable otherwise. In the group of cases that I had the opportunity of seeing at the Peter Bent Brigham Hospital during the years 1932 to 1934, the most gratifying results were obtained among patients with severe uncomplicated angina pectoris. In many, the relief from pain was dramatic. A recent communication from Dr. E. C. Eppinger, a former associate at the Peter Bent Brigham Hospital, informs me that some of these patients are having recurrences of substernal distress after two years. Nevertheless, if the procedure can provide the patient a comfortable life for two years, it must still be considered a valuable form of therapy when other measures fail.

These results again must raise the controversy as to the mechanism of relief of pain in angina. Is this return of pain due to regeneration of the previously damaged sympathetic nerve fibers, or is it due to the inherent progress of the basic pathologic process? This question can only be answered by further observations and investigations on the part of those interested in this work.

A most important factor that is likely to be neglected and must be seriously considered, is the after-care of these patients. One must continue to treat them as cardiacs, and, additionally, one frequently must treat the unpleasant sequelae of myxedema, despite the minimization of these symptoms in the literature. This involves a nicety of therapeutic management, which must be balanced between a return of congestive failure as a result of overmedication with thyroid substance or hypothyroid symptoms due to undermedication. In addition, it must be remembered that the basal metabolic rate in hypothyroid or myxedematous individuals may not be very low in the presence of dyspnea or a diminished vital capacity.

It seems apparent that, as we see and hear more of the results of total thyroidectomy for cardiac disease, the limitations of this form of therapy have become more pronounced. In the future, the selection of suitable patients will probably be narrowed down to those individuals with angina pectoris, without other cardiac complications, who would be able to lead a useful life in the absence of disabling anginal pain. With regard to patients in congestive failure, one can only say that in this group the selection of proper cases is much more difficult and demands a high degree of clinical judgment.

CORPORATIONS CANNOT PRACTICE MEDICINE IN CALIFORNIA*

RECENT OPINION HANDED DOWN BY A CALIFORNIA DISTRICT COURT OF APPEAL

Explanatory Note.—On December 12, 1935, the District Court of Appeal, First Appellate District, handed down an opinion confirming the basic points included in previous California Superior Court actions in which the right of a corporation to practice medicine had been brought up for consideration. The present opinion on that point by a higher court, with its references to the activities of a corporation seeking approval of the Insurance Commissioner of the State of California of policy forms and thus to engage in the business of selling "health insurance policies" that presumably provide medical service and hospitalization benefits merits publication space among the original articles, in order to give it a place in the literature. The editor is indebted to Mr. Hartley F. Peart, general counsel of the California Medical Association for early proof sheets of the opinion. Mr. Peart appeared in the case at the direction of the Council, as one of the *amici curiae* for appellant (Samuel L. Carpenter, Jr., Insurance Commissioner), represented by Attorney-General U. S. Webb.

---

* A Superior Court opinion involving this principle appeared in the December, 1935, issue of California and Western Medicine, page 460.

The opinion of Justice Spence, concurred in by the other members of the court, Presiding Justice Nourse and Justice Sturtevant, follows:[*]

Civil No. 9875. First Appellate District, Division Two

December 12, 1935

Pacific Employers Insurance Company (a Corporation), Petitioner and Respondent, v. Samuel L. Carpenter, Jr., substituted for E. Forest Mitchell, as Insurance Commissioner of the State of California, Respondent and Appellant.

San Francisco County—John J. Van Nostrand, Judge.

For Appellant—U. S. Webb, Attorney-General; Neil Cunningham, Deputy Attorney-General.

For Respondent—F. Britton McConnell, Christopher M. Bradley.

Amici Curiae for Appellant—Hartley F. Peart, Howard Hassard, A. B. Bianchi, Anthony J. Kennedy.

PETITIONER A CORPORATION: ITS PLEA

Petitioner is an insurance corporation qualified under the laws of this state to engage in the business of accident and health insurance. In 1931, it obtained approval by the insurance commissioner of one of its policy forms designated as MSP-2. (See Stats. 1917, p. 957.) In 1934, it sought approval of its form designated as MSP-5. It is agreed that, with certain additions, this last-mentioned form was substantially the same as the form previously approved. The question of the legality of these forms was then raised and was decided by the insurance commissioner adversely to petitioner. Form MSP-5 was, therefore, disapproved by the insurance commissioner and the approval theretofore given of form MSP-2 was revoked. Thereupon petitioner filed his petition for a writ of mandate in the superior court seeking to compel the respondent insurance commissioner to approve said forms. Copies of said forms were attached to the petition. Respondent filed a demurrer to the petition, which demurrer was overruled and respondent was given time to answer. Respondent failed to answer and the trial court thereafter entered judgment directing the writ to issue as prayed. This appeal is taken from said judgment by the respondent insurance commissioner and, in order to avoid confusion, we will refer to the parties as petitioner and respondent throughout this opinion.

CONTENTIONS OF RESPONDENTS

The respondent commissioner and *amici curiae* contend that the action of the commissioner was justified, as the approval and issuance of the policies would result in petitioner's engaging in the unlawful practice of medicine and dentistry. Petitioner, on the other hand, contends that the issuance of these policies would not result in petitioner's engaging in the unlawful practice of medicine and dentistry. It claims that the policies are purely indemnity contracts containing all the "standard provisions" prescribed by statute (Stats. 1917, p. 957 and that the respondent commissioner "acted in an unjust, arbitrary manner and thus without lawful authority" in withholding approval of said policies. It therefore appears that the main question for consideration is whether the issuance of the policies would result in such unlawful practice as claimed by the respondent commissioner.

COURT'S CITATION OF AUTHORITIES ON ILLEGALITY OF PRACTICE OF MEDICINE BY A CORPORATION

Before setting forth the terms of the policies, it may be stated that it is well settled that neither a corporation nor any other unlicensed person or entity may engage, directly or indirectly, in the practice of certain learned professions including the legal, medical, and dental professions. (*Painless Parker v. Board of Dental Examiners,* 216 Cal. 285; *People* v. *Merchants' Protective Corporation,* 189 Cal. 531; *Pilger* v. *City of Paris Dry Goods Co.,* 86 Cal. App. 277; *People* v. *California Protective Corporation,* 76 Cal. App. 354; *In re Eastern Idaho Loan & Trust Co.,* 288 Pac. 157; *In re Otterness,* 232 N. W. 318; *People* v. *Association of Real Estate Taxpayers,* 187 N. E. 823; *Unger* v. *Landlords' Management Corporation,* 168 Atl. 229; *People* v. *John H. Woodbury Dermatological Institute,* 85 N. E. 697; *State* v. *Baker,* 235 N. W. 313; *Godfrey* v. *Medical Society of New York County,* 164 N. Y. S. 846; *People* v. *Painless Parker Dentist,* 275 Pac. 928; *State* v. *Bailey Dental Co.,* 234 N. W. 260; *State Board of Dental Examiners* v. *Savelle,* 8 Pac. [2d] 693; *State Board of Dental Examiners* v. *Miller,* 8 Pac. [2d] 699; *Hannon* v. *Siegel-Cooper* Co., 60 N. E. 597; *Winslow* v. *Kansas State Board of Dental Examiners,* 223 Pac. 308; *State* v. *Laylin,* 3 Ohio Nisi Prius [N. S.] 185, affirmed 76 N. E. 567; 6A Cal. Jur., p. 1260, Sec. 722; 14A Cor. Jur., pp. 296, 297, 298, Sec. 2145.) Under the foregoing authorities it is clearly declared unlawful for a corporation to indirectly practice any of said professions for profit by engaging professional men to perform professional services for those with whom the corporation contracts to furnish such services. In other words, said authorities declare that said professions are not open to commercial exploitation, as it is said to be against public policy to permit a "middleman" to intervene for profit in establishing the professional relationships between the members of said professions and the members of the public. (*Hightower* v. *Detroit Edison Co.,* 247 N. W. 97.)

In *Painless Parker* v. *Board of Dental Examiners,* 216 Cal. 285, the court said at page 298: "The practice of dentistry is not open to commercial exploitation. Such would be its fate if the methods adopted by petitioner should become general. That a corporation may not engage in the practice of law, medicine or dentistry is a settled question in this state. None of those professions which involves a relationship of a personal as well as a professional character, which has to do with personal privacy, can be placed in the same category as druggists, architects, or other vocations where no such relationship exists."

In *Pilger* v. *City of Paris Dry Goods Co.,* 86 Cal. App. 277, at pages 281 and 282, the court said: "A corporation can neither practice law nor hire lawyers to carry on the business of practicing law for it, any more than it can practice medicine or dentistry by hiring doctors or dentists to act for it."

The subject is treated in 6A California Jurisprudence, page 1260, as follows: "There are certain professional occupations which a corporation is functionally incapable of engaging in, such as the practice of law, medicine, and dentistry. A corporation is incapable of the relation of personal confidence and trust requisite to the attorney's relation to his client, and this is also true of the other professions in which there is a personal confidence. A corporation cannot evade these rules by hiring others to perform professional functions." The subject is also considered in 14A Corpus Juris on pages 296, 297 and 298, and after stating that there are statutes in many states which prohibit corporations from practicing said professions, it is declared that, "Such statutes are merely confirmatory of the already existing law."

PROVISIONS CONTAINED IN THE CORPORATION'S POLICIES

We now turn to a consideration of the policies before us. These policies are substantially the same for the purposes of this discussion, and we will confine our consideration to policy form MSP-5. Said policy was entitled "Medical Service Policy." It provided for "Aggregate Service Benefits $1,250" and for "Accidental Death Benefits $1,000," payable in the manner hereinafter described. No provision was made for the payment of any disability benefits. The material provisions of said policy were as follows:

> Pacific Employers Insurance Company . . . agrees . . . that (the insured) is entitled to, and the company agrees to pay for:

---

[*] Editor's Note.—The subheadings have been inserted by the editor.

Medical Services.—In the manner and to the extent herein provided in the event of disease or injury, which may have inception after the effective date hereof and while this policy is in force, and which does not arise out of the occupation of the insured so as to come within the provisions of any Workmen's Compensation Law, scheme or plan.

Aggregate Service Benefits $1,250.—The total amount of liability of the company payable for medical, surgical, hospital and other services combined, either consecutively or in the aggregate, shall in no event exceed the amount specified above as aggregate service benefits, during any twelve month period from the date of this policy or from any anniversary date thereof.

Service Conditions.—The company shall appoint a medical director who shall be a licensed physician and surgeon and the term "medical director" used herein shall mean only such physician and surgeon appointed by the company in writing and while such appointment is in effect and unrevoked.

The company or its medical director shall make written appointment of licensed physicians and surgeons to render services in accordance with the provisions hereof who shall be termed "designated physician." The company or its medical director shall also make written appointment of licensed dentists, oculists and optometrists to render service in accordance with the provisions hereof who shall be termed "designated specialist." The terms "designated physician" and/or * "designated specialist" used herein shall mean only such physicians, surgeons, dentists, oculists and optometrists so appointed and while such appointment is in effect and unrevoked.

Physicians and Surgeons, Hospital and Other Services Provided.—Medical or surgical treatment by the medical director or a designated physician and hospitalization and the services of consultants and specialists when authorized by the medical director as hereinafter provided:

Office.—The insured is entitled to office care for a period not exceeding fifty-two (52) weeks for any one disease or injury or complications thereof for the purpose of treatment of the insured therefor and may call at the offices of the medical director or any designated physician during office hours for physical examination, diagnosis and treatment which shall include:

Any recognized diagnostic, preventive and curative medical and surgical measure, also necessary drugs, dressings and other materials, when dispensed by the attending physician, x-rays, massage, diathermy, ultra violet and other physio-therapeutical treatments, microscopical and other laboratory tests and analyses.

Home.—The insured is entitled to care at his or her home, at any time, day or night, for a period not exceeding twenty-six (26) weeks for any one disease or injury or complications thereof by a designated physician and to the services of consultants and specialists when authorized by the medical director, when the insured is necessarily confined to bed or unable to call at the offices of the medical director or any designated physician.

Emergency Treatment.—In case of extreme emergency (where any delay may prove fatal or cause additional disability) the insured may call the nearest physician (M. D.) for first aid only. For such emergency treatment an allowance will be made to the attending physician in accordance with the schedule of fees adopted by the company, providing the total amount for such emergency service shall not exceed $25. All further treatments must be rendered by a physician or surgeon approved by the company.

Health Preservation and Life Extension Service.—The insured is entitled to annual complete physical examination at the office of the medical director or any designated physician and to consultation at such offices at any time while this policy is in force relative to proper health preservation and life extension measures.

Dental Service.—The insured is entitled to annual examination and cleaning of the teeth by designated specialists.

Oculist and Optometrist Service.—The insured is entitled to annual examination of the eyes with prescription for glasses, also treatment for acute eye disease and injuries by designated specialists.

Additional Provisions.—The insured is entitled to the medical service herein specified only when under the exclusive care and supervision of the medical director and/or designated physician and/or designated specialist. In the event that the insured places himself under the care of any person other than the medical director and/or a designated physician and/or a designated specialist, except as otherwise herein provided, the rights of the insured to all further benefits under this policy shall forthwith terminate.

With regard to payment of the benefits under the policy, the policy itself provided, "Indemnity for loss of life of the insured is payable to the beneficiary if surviving the insured, and otherwise to the estate of the insured. All other indemnities of this policy are payable to the insured." It should be noted, however, that the application form which was attached to and made a part of the policy, contained the following provision: "I hereby request and authorize the company to pay any indemnities due me under any policy issued upon this application directly to the physicians, institutions or agencies rendering services. This request and authority is revokable by written notice to the company at any time, but such notice shall not effect the above request and authority with respect to medical services for any condition or its complications having inception prior to such written notice."

COURT'S COMMENTS ON THE POLICY SUBMITTED

Taking the policy by its four corners and considering all of its provisions, including those above set forth, we cannot escape the conclusion that it is basically and primarily an agreement by petitioner, in consideration of the premium paid by the insured, to furnish the designated professional services through its appointed staff, consisting of its medical director, its designated physicians and its designated specialists. It necessarily follows that the issuance of such policies would result in petitioner's engaging in the unlawful practice of at least two of the learned professions, to wit, medicine and dentistry.

Petitioner takes the position that the policy constitutes a 'contract of indemnity between the insurer and the assured—nothing more," but this position may not be sustained. It is true that the policy contains certain provisions regarding the payment of indemnities as required in all standard form contracts, but the policy is more than a mere contract of indemnity. We believe petitioner's own designation of the policy as a "Medical Service Policy" more nearly describes the true nature of the agreement. It is essentially an agreement by petitioner to furnish medical services and other professional services through its own appointed staff of professional men rather than an agreement to indemnify petitioner against indebtedness incurred by the insured for such services with professional men of his own choosing.

CORPORATION'S APPOINTMENT OF A "MEDICAL DIRECTOR" AND OTHER "PHYSICIANS AND SPECIALISTS"

We believe that an examination of the various provisions of the policy fully sustain the conclusions above set forth. Throughout this "Medical Service Policy" it is specified that "the insured is entitled to" various professional services, including medical and dental services, under the terms and conditions set forth. One of the main headings of the policy reads, "Physicians and Surgeons, Hospital and Other Services Provided." It is provided that petitioner will appoint a medical director, designated physicians and designated specialists "to render services in accordance with the provisions" of the policy and that "The insured is entitled to the medical service herein specified only when under the exclusive care and supervisions of the medical director and/or designated physician and/or designated specialist." It is further provided that if "the insured places himself under the care of any person" other than those appointed by petitioner, "the rights of all further benefits under this policy shall forthwith terminate." The only exception made in this connection is for emergency treatment for first aid only, in which event "an allowance will be made to the attending physician in accordance with the schedule of fees adopted by the company, providing the total amount for such emergency treatment shall not exceed $25." The insured is further entitled to annual complete physical examination by petitioner's appointees and to office consultation at any time, to annual dental examination and cleaning of teeth by petitioner's appointees, and "to annual examination of the eyes with prescription for glasses, also treatment for acute eye diseases and injuries by designated specialists." It requires no further comment to show that the agreement was one by petitioner to furnish all the services mentioned other than first-aid treatment, through its own appointees.

---

*An article on a recent Wisconsin Supreme Court opinion on the use of the words "and/or" is printed in this issue, on page 71.

PETITIONER'S MUCH ADO ABOUT A TECHNICAL INSERTION (LEGALLY NECESSARY)

Petitioner makes much of the fact that the so-called indemnities are payable to the insured under the terms of the policy and to the further fact that the provision contained in the application authorizing petitioner to pay the so-called indemnities directly to its appointees may be revoked at any time by the insured. We attach but little significance to these considerations. The policy provision regarding the payment of indemnities to the insured was necessarily inserted because required by the Act (Stats. 1917, p. 957), and the provision in the application was no doubt inserted to modify the requirement of the Act as far as possible. It is apparent that the appointees of petitioner wer eto be compensated according to a schedule of fees adopted by petitioner and not be liable to its appointees for services rendered to the policyholders. The authorization of direct payment in the application was merely a convenient method of insuring payment to its appointees for services rendered to the policyholder and of avoiding the possibility of being required to pay both the policyholder and its appointees in the event that the policyholder failed to pay said appointees after receiving the so-called indemnities from the petitioner. It may be further noted that the notice of revocation by the insured was not to affect petitioner's authority with respect to services "for any condition or its complications having inception prior to such written notice."

PETITIONER CORPORATION'S OBJECTIONS TO USE OF WORD "EMPLOYEES" NOT VITAL

Petitioner also takes exception to the word "employees" as applied by respondent and *amici curiae* to petitioner's appointees. It may be true that a member of the learned professions may not be an "employee" of a corporation in the strict sense of the word, if that term is used to signify such right of control over the practitioner in the details of his work as to render the corporation liable under the doctrine of respondeat superior. (See *Pilger* v. *City of Paris*, supra.) But we need not quibble here over the use of terms as it is immaterial whether the appointed practitioners are termed employees, agents or appointees of the petitioner. The fact remains that petitioner's agreement was to furnish, in consideration of the premium paid by the insured, the services of doctors and dentists who were to be appointed, engaged, hired or employed by petitioner for the purpose of furnishing such services. Any such agreement is clearly condemned as unlawful and against public policy by the authorities above cited.

PETITIONER CORPORATION'S PLEA OF SOCIAL AND ECONOMIC NEED FOR HEALTH INSURANCE NOT LEGALLY SOUND

Petitioner discusses at some length the social and economic need for health insurance. We assume that petitioner refers to compulsory health insurance or some form of health insurance similar to that offered in petitioner's policy as health insurance policies are now provided for under the above-mentioned Act. It is a matter of common knowledge that the general subject of health insurance has provoked much discussion in recent years and it is also a matter of common knowledge that there is a great diversity of opinion concerning this subject. There are those who believe that the time has come when the rules so firmly established by the authorities above cited should be changed or modified in certain respects. We do not feel called upon, however, to discuss this question, for if the established rules are to be changed or modified, we deem it to be the province of the legislature rather than the courts to determine when, to what extent and under what conditions and restrictions, the change or modification should be made. In this connection it is of interest to note the legislative history of Senate Bill No. 471, introduced at the 1935 session of the legislature, as shown by the legislative journals of which we may take judicial notice. (*French* v. *Senate,* 146 Cal. 604.) Said bill was apparently introduced for the purpose of legalizing the type of insurance provided by the policy before us. In the *Assembly Journal* of May 23, 1935, at page 22, it appears that the assembly amended the bill to eliminate all reference to dentistry. In the *Assembly Journal* of June 12, 1935, at pages 42 to 46, it appears that the bill was amended to eliminate all reference to medicine and the following was added: "This chapter shall not authorize and nothing in this chapter shall be construed as authorizing any corporation or any insurer licensed hereunder or any person other than a holder of a valid and unrevoked physicians and surgeons certificate to practice medicine and surgery directly or indirectly or to furnish professional services of physicians and surgeons." The bill was thereafter permitted to die on the files without being brought up for final passage. It thus appears that the legislature was not yet prepared to change or modify the established rules prohibiting the corporate practice of medicine and dentistry.

PETITIONER CORPORATION'S CITATIONS OF AUTHORITIES NOT PERTINENT

Petitioner cites and relies upon *Physicians' Defense Co.* v. *Cooper,* 199 Fed. 576. There the company failed to comply with the insurance laws requiring an insurance company to file a bond and to obtain a certificate of authority. The company claimed the right to do business without complying with the requirements of the insurance laws and sought an injunction against the insurance commissioner. This was denied. On appeal the court stated, "But one question is presented on this appeal, which is whether the company is transacting an insurance business within the meaning of the statutes of California relating to the subject." The court decided that the company was transacting an insurance business and affirmed the judgment. That case is not in point as no question was raised concerning the legality of the company's contract and said question was not considered or determined by the court. Petitioner also relies upon the language of the court in *Pilger* v. *City of Paris Dry Goods Co.,* 86 Cal. App. 277, at page 283, where it is indicated that a corporation may undertake to furnish the services of a physician. It is sufficient to state that said language was not necessary to the decision but we may further state that if said language is to be construed as sustaining petitioner's position here, it is not in line with the great weight of authority.

COURT'S DECISION: PETITIONER CORPORATION NOT ENTITLED TO APPROVAL OF POLICY FORMS—JUDGMENT REVERSED

Upon oral argument, it was contended by petitioner that the power of the respondent insurance commissioner in determining whether the policy complied with the "requirements of law" was limited to a determination of whether the policy contained the standard provisions prescribed by the Act. (Stats. 1917, p. 957.) In other words, petitioner took the position that regardless of whether the approval and issuance of the policy would result in petitioner's engaging in the unlawful practice of medicine and dentistry, respondent was required to approve the policy if it contained the standard provisions prescribed by said Act. While we are of the opinion that this contention may not be sustained, we believe that in any event petitioner was not entitled to judgment directing the issuance of the writ of mandate. If the approval and issuance of petitioner's policy would result in petitioner's engaging in the unlawful practice of medicine and dentistry as above stated, then the writ should not issue to compel the approval of the policy as the writ should never issue to compel an act which will tend to aid an unlawful purpose. (16 Cal. Jur., p. 780.)

The judgment is reversed.

THE LURE OF MEDICAL HISTORY†

HISTORICAL GYNECOLOGY

By Clement H. Arnold, M.D.
San Francisco

Ever since man emerged from out the evolutional murk of time into the dim, crepuscular foreshadowings of his present form, his young born viviparous and altricial, the females of his species have been subject to all the same affliction as their mates. They have, however, in addition been forced to endure, as part of their sacrifice to the perpetuation of the race, immediate and remote misadventures of their birth tracts.

Practically all those anatomical and pathologic changes with which we are today familiar, barring the ravages of certain infections, existed then as now. Paleopathology has revealed the presence of degenerative diseases which have so often been puritanically relegated to our own sinful era when Bacchus, Vulcan, and Venus were supposed to be the reigning deities, and not in the "good old days," when virtue ruled unspotted and every prospect pleased.

These revelations are somewhat heartening to our pride of progress, rid us of an inferiority complex, and gild our hopes for the future.

EARLIEST WRITTEN RECORDS

In seeking material for some historical notes on ancient gynecology,[1] we must travel back to the sixteenth century, B. C., and examine the pages of the Papyrus Ebers. This papyrus is the oldest work on medicine which we possess, and its pages contain some real facts concerning gynecology; unfortunately the Hermetic Book, somewhat older, which was devoted to the consideration of the diseases of women, was not preserved.

Next we find two Hindu works, the "Charaka Veda" and the "Sushruta Veda," and since some portions date back to beyond 900 B. C., and as they contain passages in great number bearing on the diseases of women, they enable us to see the great antiquity of certain methods and therapeutic agents used in the treatment of gynecological cases at the present time; notably tampons, the cautery, pessaries, and astringent washes.

We then come to the Grecian period and to the genuine works of Hippocrates (460-377 B. C.), which, however, contain little of interest. On the other hand, among the works attributed to Hippocrates, but now considered spurious, we have several treatises on gynecology which contain a surprising number of accurate observations, and convince us that gynecology was a branch of medicine that had received a large share of attention among the Greeks.

From Greece we travel to Alexandria, third and fourth centuries, B. C.; but time has not preserved for us any of the many treatises which we have reason to believe were written on the diseases of women by those who studied in the schools of the Egyptian Athens.

THE ROMAN PERIOD

In the Roman period, next, the first of the writers was Celsus, 50 B. C. to 7 A. D., who lived in the reigns of Augustus and Tiberius, and who has left us, in his most gracefully written work on medicine, some observations on the anatomy of the uterus, and some descriptions of gynecological operations. Pliny, born in 23 A. D., and who perished in the eruption of Vesuvius, 79 A. D., has recorded, in his encyclopedic work on natural history, many therapeutic agents in use in the treatment of the diseases of women. Soranus of Ephesus, who flourished in the reigns of Trajan and Hadrian, has handed down a most brilliant and interesting work on gynecology and obstetrics; while Rufus, also of Ephesus, has given a catalogue of terms applied to the various parts of female organs of generation.

Traveling down the stream of time, we meet with Aretaeus of the first, and Dioscorides of the first or second century, and we find something of interest relative to gynecology in the works of both these writers. We next come to the illustrious Galen, born 130 A. D., whose monumental labors, however, have not enriched the field of gynecology, although we find among his genuine works an interesting treatise on the dissection of the female genital organs, as well as many observations on the physiology of these parts.

IN THE FAR EAST

Leaving Italy, we turn once more to the East. Under the Byzantine rule we find Oribasius, 326 to 403 A. D., compiling his vast encyclopedia of seventy volumes, from whose pages we are able to glean some facts about our subject. At the same Court, in the sixth century, Aetius composed his medical and surgical treatises in sixteen books (translated into Latin in 1542), the last of which is devoted to the diseases of women. This work is of the greatest importance; for, while it contains much that Soranus has given, it presents at the same time chapters from such authors as Archigenes and Philumenus, whose works have perished forever. We also notice the curious work of Moschion, which is now known to be only an abbreviation of Soranus.

Lastly we come to the seventh century and to the brilliant résumé of ancient medicine contained in the great work of Paulus Aegineta.

THE DARK AGES

Here our labors cease; for with the death of Paul the Dark Ages began, lasting almost 1,500 years, and the gynecology contained in the works of the Arabian authors is only a servile copy from the pages of those who had preceded them.

Hippocrates says that "if the mouth of the womb gapes in a manner contrary to nature, the menstrual periods become more abundant and viscid, they come on more frequently than normal, and the patient suffers from pain in the lower part of the abdomen and in the loins. The treatment should be by medicated pessaries and astringents."

---

† A Twenty-five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

Soranus states that an erosion which succeeds an ulceration may be the cause of menorrhagia and metrorrhagia.

Aetius tells us that fissures around the mouth of the womb are caused by difficult labors on account of the size of the child's head: in the treatment, be it observed, Aetius says that all surgical interference and medicines of an irritating nature are to be avoided, for such induce inflammation.

The descriptions given us by the author of the Hippocratic works on gynecology, of inflammation of the uterus, refer to both acute and chronic cervicitis and metritis; and the clinical pictures that he draws are most excellent and accurate.

Soranus has given us a most elaborate account of the several symptoms and signs which are to be found following inflammation of the various regions of the uterus and cervix. His descriptions embrace a consideration of parametritis and pelvic abscess. Aetius also deals at length with the same subjects.

It is interesting beyond measure that Hippocrates, Aetius, and Oribasius all mention the various degrees of cancer of the womb, stating that, when advanced, the disease is incurable. Hippocrates mentions its (*cancer's*) possible relationship to chronic irritation, yet he warns the surgeon against interference in a case of *"malignant thymus,"* and *"malignant polypus,"* of the womb; but Oribasius advises the use of the cautery in case of malignant thymus. He it was (325 A. D.), after making some lengthy remarks about the cervix uteri, who says that hardness of the cervix is a symptom of three different conditions: dryness, inflammation and scirrhus of the womb, the last of which, from his description, almost certainly includes carcinoma in some form.

GONORRHEA

The period at which gonorrhea first attacked the human race is not known. But since we recognize what an enormous factor this affection plays in the etiology of the diseases of women, it is necessary to examine those passages in ancient writers which apparently refer to the disease; for if gonorrhea then existed—and we believe that it did—the women in the past must have suffered, for certain, as the result of this disease, all those complications, such as tubal disease and acute metritis, with which we are familiar at the present day.

Moses, in the fifteenth chapter of Leviticus, says: "When a man hath a running issue out of his flesh, because of his issue he is unclean" (Verse 2). The septuagint version renders "Hazzab," the man with the issue, by ὁ γονοϱϱυής the man with a gonorrhea: with regard to the term ὁ γονοϱϱεύς, we find this term was used by Rufus, Aetius, and Paulus to express a condition of spermatorrhea, not of gonorrhea, as we now understand the term; and Galen ("de Locis Affect" Vi, 6) says that gonorrhea is an involuntary excretion of sperm and is derived from γονέ seed, and ϱέω, to run. But Moses does not mean that the issue mentioned in verse 2, is spermatorrhea, because that affection is mentioned in verse 16, and verse 32 says: "This is the law of him that hath an issue, and of him whose seed goeth from him, and he is defiled therewith."

In Deuteronomy (xxiv 1) it is stated that if a man should marry a woman, "and it come to pass that she find no favor in his eyes, because he hath found some uncleanness in her, let him write her a bill of divorcement."

Now if gonorrhea existed (and we have said above we have every good reason to prove that it did) it follows naturally that Bartholinian gland abscesses existed, as did also vaginitis, cervicitis, salpingitis, endometritis, and pyo-salpinx. There can be little doubt that some of these diseases were treated, and it is probable that the priest-physicians, if they lacked gynecological material from the modesty of the Egyptian women (though the revels of the feast of Bubastis in later years show us little modesty), could have obtained plenty of subjects among the prostitutes of the times, who were then a semireligious cult often sequestered in the temples, and would naturally be desirous of being cured of their complaints.

Halban[2] gives an account of the knowledge of gonorrhea and infections of the uterus and cervix among the ancient Jews.

Among the Romans, women who could not have intercourse, either on account of the menses or on account of disease of the genitals, were termed "ancunulentae," from "cunus," the vagina; and these prayed to Juno Fluonia, and were accustomed to use the "aster atticus." This plant is mentioned by Pliny as being a sovereign remedy for diseases of the groin. The Greeks termed it "Bubonion," while the Romans called it "Bubonium," and the word came to be used and applied to the disease for which it was given, whether in the case of male or female; this is the origin of our term, "bubo." The Romans said of a female, who communicated a disease to a man, "Haec te imbubinat." Strangely enough, among the Romans venereal disease did not appear to be so prevalent among prostitutes as among others. Parenthetically, Roman prostitutes were supposed to wear "yellow wigs," a possible origin for the color of the Board of Health flag, and an explanation as to *"Why gentlemen prefer blondes!"*

Roman doctors declined to treat "secret diseases," and, therefore, the rich were treated by their own slave doctors, while the poor were driven into seclusion; a custom, in fact, that prevailed among the children of Israel, who "were to put out of the camp every leper, and everyone that hath an issue." In 1497, James IV of Scotland, in consequence of the frightful prevalence of the venereal diseases in Edinburgh, issued the celebrated proclamation banishing the infected from the city. But it is probable that if the Roman doctors may have declined to attend patients afflicted with venereal diseases, the "archiatri," who acted somewhat after the fashion of the dispensary surgeon of the present day, treated those diseases embraced under the generic term, "morbus indecens," inasmuch as they were bound to treat the poor gratuitously, though they might charge the rich.

At subsequent periods this disease, gonorrhea, in men and women, and in many instances its complications of swelled testicle and cystitis were described with more or less detail by Mesus (904); by Ali Abbas, one of the Persian Magi (980); by Rhazes (852), and by Albacusis and others.

McKay states in conclusion: "Since writing the résumé on gonorrhea, we have been able to consult the Jerusalem Talmud, and the frequent references therein to gonorrhea confirms us in the opinion that this disease played an important part in the etiology of the diseases of women in ancient times."

Dr. Henry Harris of San Francisco has kindly called my attention to the fact that similar deductions may also be made from a study of passages in the Jewish Torah.

COMMENT

During the first two hundred years of the Byzantine period Pliny, Celsus, Dioscorides, Soranus, Caelius Aurelianus, Aertaeus, and Galen lived and wrote, and while the Roman power was at its zenith, during the Augustan period. Yet slowly and inevitably the power of Rome had begun to decline toward its nadir; and though the works of Galen represent the highest point to which medical science attained in ancient times, yet after his death (A. D. 200) we have a fall so abrupt that we may say without exaggeration that the works we encounter for the next more than fifteen hundred years are but shadows of those written by Galen and his predecessors, and show, in their language, as in their subject-matter, the rapid decline of intellectual vigor and original research.

From these early times through the more than ten slumberous centuries of darkness in all human progress, when arm-chair philosophy and disputative dialectics reigned in place of observation and experimentation, we at last reach the beginnings of the nineteenth century with but little change and no advance. Then, gradually, we commence to note the adumbrations of efforts and works dealing with inflammation of the uterus and generative organs.

BENNETT'S WORK

In 1842 appeared a charming, simple, naïve and altogether delightful volume, entitled "A Practical Treatise on the Inflammation of the Uterus, Its Cervix and Appendages and on Its Connexion with Internal Diseases" by John Henry Bennett, M. D., London.

Its deliberate sentences, orotund phraseology and cultured periods, remind us most forcibly of the classically educated and dignified country bedside practitioner of an older age. Among many other headings the author has gathered together, somewhat oracularly, the extant practical knowledge of what was known at the time as "cervical fungous endometritis."

The venerable doctor whose aegis of success was the relief of human suffering, and surcease from pain, began upon a somewhat false premise of anatomical lack of knowledge, and built up a bit didactically his thesis of the pathology and treatment of cervicitis; accepting what he thought was of value from the ancients, discarding what appeared to him as valueless, and leavened it with his own observation and experience. Though we may smile somewhat patronizingly from the Parnassian heights of our questionably superior intelligence, he has made a convincingly practical and excellent job of it.

"The presence of cellular tissue in the cervix," he says, "its greater vascularity as compared with the uterus, and the highly developed state of the mucous membrane lining it, are, in a pathological point of view, the most important anatomical peculiarities which it presents; generally speaking, both the mucous follicles and the vascular mucous network are simultaneously the seat of inflammation. The causes which give rise to inflammation of the cervix may be divided into 'predisposing and efficient.'"

He mentions that pains in the lower part of the back, in the hips and thighs, are also generally mistaken for indications of constitutional weakness. Thus, our Nestorian gynecologist proceeds through "Errors in Diagnosis," "Inflammation and Ulceration in the Virgin," "During Pregnancy," "Neck of the Uterus in Advanced Life," and so on; yet, despite what we know existed in the observations recorded in books which antedated him by centuries, we find practically no mention of gonorrhea; no evidence of microscopic examinations, and with no conception, even, to approach those of the ancient Rabbins in regard to septic invaders, nor of the relationship of chronic inflammation to malignancy; yet, and withal, as far as it goes, it is an excellent guide to the practical gynecology, its régime and treatment, of his years.

"The secretion of the ulcerated surfaces, wherever its seat, is necessarily purulent. The pus may be thick and 'of a healthy yellow color' (Laudable pus), or it may be thin, sanious or ichorous according to the state of the ulceration."

Doctor Bennett may be taken as the altogether admirable prototype of the better class gynecologist of his time. Despite their histological, bacteriological and pathological ignorance, these old gentlemen were well informed in a modern sense regarding the pains, disabilities, and available methods of practical treatment, the whole being complemented by a profound psychological knowledge of human nature.

"The pain occasioned by inflammation and ulceration of the uterine neck is seldom found behind the pubis, the anatomical seat of the diseased cervix, but in one or both of the ovarian regions, in the lower lumbar and upper sacral region. The uninterrupted persistence of one or all of these pains—is an important feature of their character."

After an exposition of local antiphlogistic measures, such as heat, hot milk and carbolized water injections, silver nitrate placed in the cervical canal, alum insufflations and other astringent washes of an almost inquisitorial nature, he concludes hopefully and benignly, "inflammatory ulceration of the cervix uteri, not being, *per se,* a fatal disease."

These men antedated by some decades the modern throes of gynecological rebirth, yet their case records demonstrate a pleasing number of probable cures, and a large number of relieved patients, for whom life was made more endurable; and more pleasing still, they were the recipients of vastly more gratitude and appreciative recognition than obtains in this age of hypersophistication.

THE MODERN PERIOD

Now the flickering torch of revivified knowledge in the modern phases of gynecology began to gleam. Lawson Tait, Sims, McDowell, and illustrious others, all infused increased energy into the shedding of light, and then Howard Kelly, in this country, gave it its greatest encouragement, impetus, and brilliance.

It is interesting and thought-provoking to observe that from even the earliest times down to our own, there appear to be cyclical swingings to and fro, hand in hand with all the succeeding advances in medical, chemical and biological science; now to that side which advocates the complete destruction and extirpation of tissue and its contained noxa, regardless of fact or function, then to the side of the chemical disinfectants directed chiefly against the bacterium itself. Then, ever and anon, "the still small voice" gains volume through the incisive, reverberations of surgical and semi-surgical argument, pleading, "Hold! why not give the tissues themselves a chance? Surely, Mother Nature, if relieved of some overburden and her intrinsic reparative ability abetted, can carry on." For a while the more moderate methods tending to increase local tissue resistance, rather than mutilative ablations, prevail; then, behold, some new, supposedly powerful germicide is "hozzanaed" forth under the all-puissant trade-mark of some grandiose pharmaceutical house, garnished in the flamboyant banners and gaudy clamant fustian of intemperate advertising; poor critique, combined with exaggerated claims of what it can do *in vitro,* presented in pseudoscientific reports, and the whole "devil's dance" whirls on again until the next generation, perhaps, fortified and informed by experimentation, tragic failures and numerous reliable clinical reports decides again for "common sense."

IN CONCLUSION

An historical and philosophical purview of this subject, similar to that of any other of life's activities, is always intriguing and enlightening. In the illumination of our present attitude, modern *modi operandi,* and following intimately the dictum of Huxley, "that science is organized common sense," leavened with knowledge, it is noteworthy and arresting that the same "natural" methods that we use today—heat, hyperemia, astringent applications, posture, hygiene, packs, pessaries, etc., were in use in the dim vistas of the Babylonian desert and on the uptilted escarpments of the Oxus River when civilization was germinating; and that when these men, too, used extreme measures their practice, in keeping with their more heroic age, was, perhaps, more drastic in degree but differing not at all in kind from ours.

CLINICAL NOTES AND CASE REPORTS

BREAST SUPPORT

By Harry S. Fist, M.D.
Los Angeles

An ideal breast binder would hold the breasts in the position which is normal in lower animals. In prehistoric days, when the human race walked on all-fours, breast binders were not needed. Now, because of the upright posture, the breasts drop against the chest, so that milk flow and lymph drainage are interrupted.

For years physicians have recognized the necessity for a breast support, especially during the period after childbirth, when breasts are engorged and painful, and secretion of milk begins.

The first breast binders were merely strips of cloth pinned around the chest, pressing on the breasts, interfering with axillary lymph drainage. Later, binders were shaped to the body more or less, but the first really satisfactory breast support was described in 1919 by Dr. Alfred C. Beck.[1] This binder originally consisted of a piece of old sheet about eighteen inches wide and fifty-four inches long. The middle portion covered the patient's back, and each end was brought across the breast of one side and over the opposite shoulder, where it was pinned to the top of the back portion of the cloth. A towel was used as a pad. The flaps were pinned together in front at top and bottom. This binder lifted the breasts

Fig. 4.—Second shoulder strap pinned to lower margin of opposite lower flap.

Fig. 5.—Upper flaps folded across and held with one pin through all thicknesses.

without undue pressure, but was bulky and uncomfortable in the back, especially at the spots where it was pinned.

Later, Doctor Beck improved this binder by dividing each end of the cloth into a longer lower flap and a shorter upper flap. By bringing the lower flaps up and pinning over the opposite shoulder, a support was formed which assumed the natural form of the breasts, holding them up without pressing them against the chest.

The author's binder utilizes the principles described by Beck, but adds the following changes: the back is shaped, and has long shoulder straps which permit pinning in the front so the patient may herself easily apply the binder. Bunching is avoided, and there are no lumps or safety pins in the back.

This binder, as illustrated (Fig. 1), has proved satisfactory in the maternity department of the Cedars of Lebanon Hospital for over three years, and is now in use in the Los Angeles General Hospital. It is satisfactory only when correctly applied. The author's method is as follows:

1. Place the binder around the body, with the large flat surface in back, and pin the lower flaps snugly together at the bottom to anchor the binder. (Fig. 2.)

2. Pin the lower edge of one lower flap to the shoulder strap of the opposite side, thus lifting one breast. (Fig. 3.)

3. Pin the lower edge of the other lower flap to the second shoulder strap, lifting the second breast. (Fig. 4.)

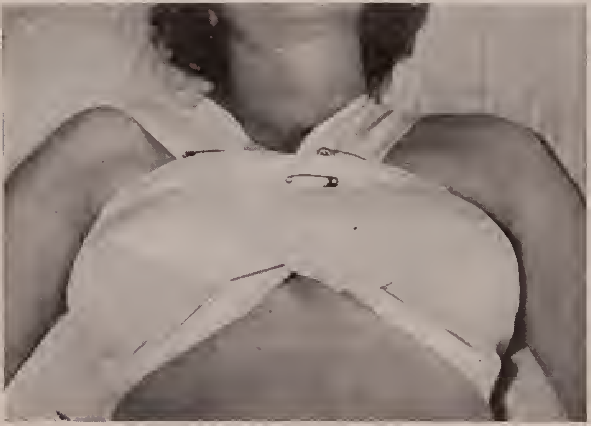

Fig. 6.—Photograph of binder as applied.

4. Fold both upper flaps across the upper portions of the breasts and pin in the middle through all layers of cloth. (Figs. 5 and 6.)

5. For nursing, simply unpin the upper flaps and that lower flap which supports the breast to be nursed. These two pins are easily replaced by the patient.

SUMMARY

This easily made binder, of unbleached muslin, is inexpensive, washable, adjustable, and comfortable, furnishing excellent breast support. It is especially useful for puerperal patients.*

1930 Wilshire Boulevard.

LIVER SUPPURATION

A SUMMARY: WITH CONCLUSIONS

By John W. Shuman, M.D.
Los Angeles

WHEN we see in a medical journal a lengthy article upon a subject that interests us, we turn to the end of it, and if there is a summary and a conclusion we read them; if not, we are apt to turn on. So herewith a summary:

SUMMARY

1. *Solitary Abscess.*

The single liver abscess is amebic in origin, and comes from the large intestine through the portal vein.

If we have a patient with a fever of unknown origin, who chills and sweats, has liver pains, dyspepsia and a loss of weight, amebic liver abscess should be thought of until we can prove otherwise. Looking through the fluoroscope in such a patient will show the right diaphragm higher and less movable than the left, if an abscess is present in the upper portion of the right lobe. The blood will show a leukocytosis in most instances. If, with the aid of a trocar, we can secure amebic pus, the diagnosis is made.

Surgical drainage should be instituted. Adequate emetin hydrochlorid in quantity sufficient is excellent medicine for amebic patients.

A large abscess causes the patient to lie on the right side or to insist upon being propped up; liver dullness is increased; there is rigidity of the upper right belly wall; and if the abscess is contacting the diaphragm there will be pleuritic symptoms.

---

* Credit is due Miss Minnie Eichenberger for valuable assistance in designing this binder.

The liver should not be punctured until leukocythemia, pernicious anemia and scurvy have been excluded. A solitary abscess may be endured for years until the liver is but a shell. It may be cured spontaneously by rupture and drainage through the diaphragm and respiratory tract, or into and through the alimentary tract.

2. *Multiple Abscesses (Three Types).*

Their path of infection varies:

(*a*) Suppurative cholangeitis comes from the bile ducts, with small abscesses in the smaller bile ducts. The primary infection is usually associated with gall-stones, but may be due to parasites. Recently a nervous woman was operated upon for gall-stones. Following the cholecystectomy, she had the typical septicopyemic course, with right diaphragmatic pleurisy and a tender liver. Clinical diagnosis: "Postoperative liver suppuration." She has gone Christian Science for the time being.

(*b*) General septicemia and pyemia: Infection is through the blood stream. The onset of hepatic symptoms is sudden chills, fever, sweats, a painful and tender enlarged liver with slight jaundice, first noted in the sclera. If the infection is overwhelming, there will be no leukocytosis. The course is invariably fatal.

(*c*) Suppurative pylephlebitis: The infection in this group is in the area drained by the portal vein. In more than 50 per cent of these cases the primary focus is in the appendix. Rarer sites are piles and other rectal ills.

Numerous minute abscesses are present which, as time goes on, may coalesce, to produce a honeycomb appearance.

Differential diagnosis:

1. With empyema of the gall-bladder, jaundice is more common. It appears earlier and is more pronounced than in abscess. Unless the belly is too fat and the wall too tense, the swollen gall-bladder can be easily felt.

2. In intermittent hepatic fever there are periods of attacks of chills, fever and sweats, alternating with periods of fair health.

3. In syphilis of the liver the left lobe, as well as the right, is enlarged, the organ is nodular. There is often the history of chancre, and a positive Wassermann; and last, but not least, the therapeutic test.

4. Hydatid cyst of liver: Suppuration may occur, and that is an abscess.

5. Acute yellow atrophy, which is an advanced necrosis of all the liver cells, is characterized by jaundice, nervous symptoms, toxemia, and a small liver in the late stage.

CONCLUSIONS

Liver suppuration:

May be single or multiple.

It is always metastatic.

It is rarely diagnosed.

If multiple, it is fatal.

If single, the treatment is medical as well as surgical.

If multiple, the treatment is only palliative.

CHEMICAL PERITONITIS

FOLLOWING INTRA-UTERINE INJECTION*

By E. M. Bingham, M.D.
Riverside
AND
O. I. Cutler, M.D.
Loma Linda

REPORT OF CASE

Mrs. H. B., a white woman of twenty-eight years with four children, was three days past her menstrual date. Upon the advice of a neighbor, she attempted to inject turpentine into the uterus, using a medicine dropper. The day before, she had tried turpentine on a tampon without any effect. The injection was followed immediately by severe pain in the right lower quadrant of the abdomen and low in the back. She used a plain water douche without relief, and in two hours the pain was so intense that a physician was called. He administered ether for one-half hour, gave morphine grain one-half, and called the ambulance.

The patient arrived at the Riverside County Hospital at 3 a. m., April 3, 1934. She was apparently suffering with severe pain in both lower quadrants of the abdomen, temperature 98.6 degrees, and pulse 128. There was marked abdominal tenderness and evidence of peritoneal irritation. There was no evidence of vaginal injury, but marked tenderness on bimanual examination. She was unable to void. At 8 a. m. she appeared to be more comfortable, following catheterization and application of ice to the lower abdomen. The urine showed a trace of albumen, and the blood count was 12,300 white cells, with 84 per cent polymorphonuclears. She was given sodium amytal grains six and slept for six hours, awakening with more severe pain and a temperature of 102 degrees. At that time there was some localization to the right side, beginning distention, and increasing polymorphonuclear leukocytosis. She was still unable to void. Expectant treatment was continued for another twenty-four hours, during which time all symptoms became more marked: pain uncontrolled by morphin; marked distention; a silent abdomen; restlessness; pulse, temperature, and leukocytes increasing, as indicated in Chart 1. There was no vomiting.

Faced with a patient in critical condition and an uncertain diagnosis, an exploratory laparotomy seemed indicated. This was done at 8:30 p. m., less than forty-eight hours after the onset, under spinal anesthesia. There was some preperitoneal edema and free fluid. The peritoneum was friable. The omentum showed some necrosis and was adhered to the pelvic organs by fresh adhesions. The abdominal cavity contained approximately a pint of serous fluid containing fibrin and some pus. There was a plastic exudate on the fundus of the uterus and both adnexa. The right fallopian tube was swollen twice the size of the left, and both were acutely inflamed. The uterus and cul-de-sac showed no evidence of trauma. The appendix was explored and found outside the inflammatory field. Both tubes and ovaries were removed and the abdomen closed with drains in the cul-de-sac.

The patient made an uneventful recovery, except for serous drainage during the first week. She was discharged in three weeks. Smears of the tissue removed showed no bacteria. Cultures of the abdominal fluid remained sterile. Urinalysis showed one gram of albumen with blood cells and casts on the first and second postoperative days, returning to normal at the end of a week.

An examination of the tissues removed showed that a corpus luteum in process of formation was present in one of the ovaries. The dilation noted in one of the fallopian tubes was due to exudate confined in it. This exudate was almost wholly serous. A light in-

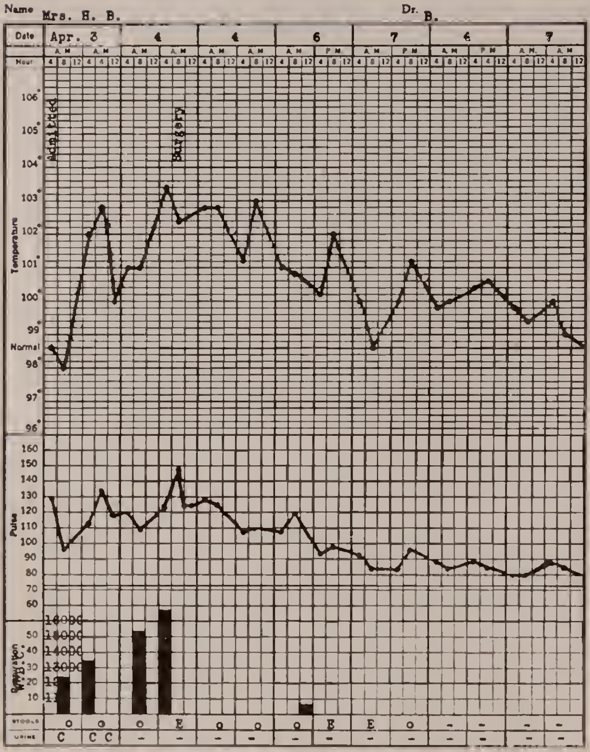

Chart. 1.—Pulse, temperature, and leucocyte record.

filtration of neutrophils and lymphocytes was present in the mucosa of the tube. A thin layer of very loose fibrinopurulent exudate was present on the external surfaces of the tubes and ovaries. The leukocytic content of this exudate was considerably less than is ordinarily seen in exudates when bacterial peritonitis is present. The exudate was undergoing organization, being already extensively invaded by fibroblasts.

COMMENT

The variety of methods used by the laity to produce abortion seem to be limited only by the number of agents in existence and the number of helpful neighbors. Upon admission, this patient appeared to be hysterical. Symptoms may have been masked by the large dose of morphin. As her condition became worse, chemical peritonitis was considered; but with the history of a small amount used, expectant treatment seemed advisable. A careful history appeared to eliminate the possibility of uterine or vaginal perforation. Acute salpingitis and ectopic pregnancy were considered because there was a history of an acute, transitory pain in the right side three days before. (What woman with four children in as many years does not have them?)

The diagnosis of chemical peritonitis may be debatable. A review of the literature shows that it is rarely made. The question of the patient's ability to inject anything into the cervix and uterus has been considered. The amount required to pass through the tubes into the abdominal cavity is small, known from radiographic procedures. Spasm of the uterus due to an irritant would reduce this amount. The onset and progress are compatible only with acute mechanical or chemical injury of a fallopian tube. The findings at operation and with the microscope were not those of septic peritonitis.

A search of the literature reveals no similar case. Peritonitis following intra-uterine injection of hypertonic saline to produce abortion is reported in the French literature by Bloch.[1] This patient recovered following total hysterectomy forty-eight hours later. No mention is made of bacteriology. The German literature[2] reports a second case which followed the use of soap solution, also with cure, following hysterectomy. Davis[3] mentions chemical irritants as an etiologic agent in producing aseptic peritonitis. He advises surgical intervention when symptoms are marked. Two cases, with death and chemical analysis at autopsy, are reported: one,[4] in 1869, followed the intra-uterine injection of "liquor ferri"; in the second,[5] in 1878, a solution of lead acetate was used.

CONCLUSIONS

The diagnosis of chemical, aseptic peritonitis in this case is based on: (*a*) Sudden, rapid onset of severe symptoms immediately following an attempt to inject turpentine into the uterus; (*b*) operative findings and pathology; (*c*) negative bacteriology; (*d*) prompt recovery, following surgical drainage.

Malpractice Protection.—The most cautious and conscientious doctor never knows when a disgruntled or scheming patient may sue him for malpractice. Although a doctor may be legally exonerated, his reputation inevitably suffers from the publicity. And the volume of such litigation, to the medical profession's alarm, constantly increases. Recently, in *Clinical Medicine and Surgery*, Dr. Isador Simon Trostler, Chicago roentgenologist, trotted out a few fundamental rules which, if scrupulously observed by doctors, he thought, might stem the tide of malpractice suits. Gist of his advice:

Never under any circumstances promise a cure or use language which might be construed as such a promise.

Be careful of diagnoses, and when there is doubt refrain from "affixing a label."

When calling a consultant select one who knows more than you do.

In surgical cases, in unfamiliar surroundings, see that a careful count of all sponges it kept all the time, and be sure that the count is verified before closing the incision.

If an operation is to be performed, have the patient, or his guardian, give consent in writing, or verbal consent in the presence of a witness.

Collect your fees when they are due. It is a well-recognized fact that many malpractice suits are started because physicians try to force payment from delinquent patients.

Do not become nervous. If things have gone wrong, do not inform the patient, his family or friends that an error has been committed. It is not necessary to misrepresent the condition, but it is easy to evade direct replies until you can determine the end-results.

Terminate your relations tactfully with patients who seem contentious or litigious.—*Time,* November 18, 1935.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

CANCER OF THE BREAST

RELATION OF CYSTIC DISEASE OF THE BREAST TO CANCER

Alson R. Kilgore, M. D. (490 Post Street, San Francisco).—A few years ago the precancerous potentialities of cystic disease in its various forms seemed well established. Although all types of cystic change present hyperplasia in the sense that the number of ducts and acini is increased, two great types may be distinguished on the basis of the behavior of the epithelial lining of individual gland units. In one the epithelium of the dilating cyst remains smooth, does not increase in thickness and in the larger cysts even disappears, leaving a bare fibrous wall. The second variety presents piling and folding of the epithelial lining (papillary single cysts, papillary cystadenoma, ducts filled with proliferated epithelium—Schimmelbusch's disease). The first may be regarded as nonhyperplastic, the second as hyperplastic, referring to the state of the epithelium and not to the number of gland units.

Since cancer comes only from epithelium, one would expect that nonhyperplastic cysts, with normal or diminished epithelium, would be unlikely to give rise to malignancy, while the hyperplastic cysts, with greatly increased and especially with abnormally growing epithelium, would be more often the site of cancer origin.

That these assumptions were true seemed not only reasonable but apparently borne out by experience reflected in surgical literature.

Recently, however, with the publication of an extensive monograph by Cheatle and Cutler [1] and of articles by Bloodgood,[2] Campbell,[3] and others, there has developed sharp difference of opinion. Cheatle and Cutler recognize the two types of cystic change mentioned above, but regard the hyperplastic type as always secondary to the nonhyperplastic, believe the latter to be strongly precancerous and so regard both types as at least potentially dangerous. They state that, in their experience, at least 20 per cent of all breast cancers arise out of cystic change.

Bloodgood and Campbell, on the other hand, are equally convinced that neither form of cystic change possesses any special tendency toward malignant degeneration. This presents a dilemma to the clinical surgeon. He must continue to deal with cystic disease and if the process is dangerous, amputate breasts; if harmless, avoid mutilation.

Campbell has offered a reasonable explanation of the development of this divergent opinion. Those who believe that cystic changes are precancerous do so because of the frequent finding of "cancer" in association with this process. Those who hold the condition harmless arrive at this conclusion because they find in follow-up studies that patients suffering from even hyperplastic cystic disease do not develop metastasis and do not die of cancer.

Of the two lines of evidence, we are inclined to regard that obtained from a study of what actually happens to patients as the more reliable. There are several possibilities of error in the microscopic determination that cancer has begun in benign cystic disease. The process presents a variety of curious histological pictures, some of which simulate cancer very closely, even to the point of apparent invasion of a few cells, as at the bases of large papillomata. The diagnosis of malignancy in epithelium still confined within duct boundaries is notoriously difficult. But if women presenting these pictures do not suffer metastasis and death, then the lesions are not cancer, as far as patients are concerned. And if, in some, a lump is removed by local excision, other similar areas being left in the breast, and still cancer deaths do not occur, the conclusion is justified that the lesions are not even precancerous. We believe it has been demonstrated that there is certainly much less danger of cancer development, even in the hyperplastic type of cystic disease, than was formerly supposed.

One finds, however, isolated cases in the literature, substantiated by reasonably clear photographic evidence, in which true metastasizing cancers have arisen in association with lumps of definitely benign hyperplastic cystic disease. Although it is impossible to collect accurate statistics from the literature, it seems that this happens a little oftener with hyperplastic cystic disease than with non-hyperplastic, in spite of the much less common incidence of the first type. (Perhaps the relationship is no more specific than that, with much increased epithelium, there are more cells exposed to the "accident" of cancer development.)

If these observations are correct, one must conclude that hyperplastic cystic disease may very occasionally have cancer associated with it, but that this association is a much less common one than was formerly supposed—so much less common, in fact, as to justify a fairly conservative surgical attitude toward it.

The following working rules seem reasonable:

1. The simple cyst (nonhyperplastic—"blue-domed" cyst) is harmless. When it composes a clinical lump, it requires exploration only for con-

firmation of diagnosis. Other smaller cysts may be left in the remaining breast without fear.

2. Papillomatous cysts and areas of papillary cystadenoma, when limited and presenting as clinical lumps, must be explored because they are lumps, but local excision is sufficient.

3. The diffuse process, involving one or both whole breasts, fortunately uncommon, presents the only real problem. If its benign character can be determined clinically (as Bloodgood believed) or by gross inspection of tissue, conservation of the breast appears to be safe and certainly desirable in younger women. In older women, past the age of likelihood of breast function and in the "cancer age," it is perhaps good surgery to remove all tissues involved.

4. Occasionally patients are seen in whom an advanced degree of hyperplastic cystic disease so changes the texture and gross appearance of breast tissue as to make it difficult or impossible to determine whether or not cancer is present. Since it is impossible to subject every area of a large breast mass to frozen section, one must occasionally do even a radical mastectomy without positive proof of the presence of cancer. In the hands of surgeons experienced in the gross pathology of breast tissue, the mistake of doing a radical operation in the absence of cancer or of failing to do one in its presence will be a very rare one.

TREATMENT

H. J. Ullmann, M. D. (1520 Chapala, Santa Barbara).—It is surprising how often physicians, faced with the care of a patient suffering from advanced cancer of the breast, will lose all interest or take a hopeless, pessimistic attitude toward the situation. These same physicians, faced with a severe myocarditis with its accompanying edema, shortness of breath, and perhaps ascites, will call upon all their experience and knowledge to see how much comfort they can bring to the sufferer. And yet, in neither, can they expect more than to obtain relief of suffering and a happier life during its short remaining term—to use a single word, palliation. A physician's duty is to relieve suffering, prolong life and, if possible, cure the disease. He is derelict in his duty if he neglects one because he cannot accomplish either of the others. It is not for these few that this is written, but for the larger number of true physicians who wish to accomplish everything possible for those patients who are their and their only responsibility.

First, a hopeful attitude, especially toward the patient. Why? Because mental suffering can be and often is greater than physical and because much can be done. Any patient is happier when something is being done for him even when he knows it is useless. Second, many things can be done that are both useful and beneficial, and these are the objects of this paper.

What I mean by "hopeless breast cancer" is only hopeless because there is no hope of the conventional five-year continual freedom from the disease, used as the criterion of cure in judging the relative value of one treatment as compared with another. The only true "hopeless" is the terminal, in whom death is only a few days or weeks away. The routine daily care of the patient and the relief of symptoms as they arrive are the most urgent and yet the most neglected phases of the problem. This is largely due to ignorance on the part of the physician. Most nurses are woefully untrained in the care of these patients and must look to the physician for both instruction and training. He must see that the nurse, as well as himself, maintains a cheerful, hopeful attitude as well as a sympathetic one. Sloughing ulcers should not simply be treated with petrolatum dressings and allowed to create a stench in the house or hospital, and I have seen such unintentional neglect even in a good hospital. These ulcers may be irrigated with warm Dobell's solution, one-half of one per cent chlorezene, peroxid, etc. At each visit the physician should remove such necrotic material as is ready to fall or may be cut away without entering living tissue. No more must be taken than can be without producing the slightest bleeding. Dressings should be gauze or lint that is not too coarse, and just enough petrolatum to prevent their adhering to the wound. This only if the wound must be covered. Exposure to air, if practicable, is better. In some instances, Dodd's wash or a thin calamin lotion is more comfortable for the patient than an ointment. If there is a dry dermatitis over the tumor instead of an ulcer, a protective ointment, such as zinc oxid, petrolatum (solid or liquid), or the above washes, may be used. The choice of dressings must be left to the judgment of the physician and the comfort of the patient.

The choice of drugs to relieve pain and discomfort is one that must be considered with care. It is easy to produce a tolerance requiring enormous doses by the injudicious use of morphin in the early stages. It is imperative that morphin be reserved until the last, and after all other methods and drugs have failed. A properly cared for wound will often render drugs unnecessary or effective in small amounts. It is important to judge between pure pain and discomfort. Aspirin will often relieve a large number of distressing discomforts that the patient may, unless carefully questioned, refer to as pain. It should always be tried before going to a stronger analgesic. The addition of acetphenetidin and, later, codein will be needed as the discomfort increases. It is a mistake to give analgesics for a wakeful night when a mild hypnotic will be effective. Amytal and sodium amytal are valuable. For more powerful effects, I have found a capsule containing aspirin—three grains, acetphenetidin—two grains and codein one-half grain, very useful except in the few cases where it causes the patient to perspire. The next step is the use of codein. This does not appear to produce a real tolerance, as does morphin, and I try to withhold morphin until such time as one grain of codein hypodermatically ceases to be effective. From this I proceed to morphin in not less than one-fourth grain hypodermatically, for I believe it is a great mistake where there is pain to give either codein or morphin in the smaller doses. They must be given more frequently and do not give the relief to which the sufferer is entitled. Codein in doses from one-half to one grain, and morphin in doses from one-fourth to one-half grain, will, unless tolerance is present, give greater relief for a smaller amount in the twenty-four hours than in doses of one-half to one-third of this given more often. I consider one-sixth grain of morphin useless, for if it gives relief the same relief could have been obtained by some other drug.

Fortunately, we have today other agents and methods to supplement or replace the ones just described. I refer to palliative surgery and radiation. Surgery has little to offer except the removal of a sloughing mass which, in a few instances, can afford great relief to both the patient and those who must care for her. Radiation in nearly all cases can offer not only great relief, but every now and then a supposed hopeless patient, especially in the aged, will have his tumor actually disappear under more or less continuous conservative radiation and pass the five-year period without recurrence—a so-called cure. Other radiologists and I have had patients under our care for from three to more than five years who, while still possessing tumors in their breasts, are perfectly free of any disability due to these tumors.

REPORT OF CASES

Case 1.—I have under my care a woman who, when she first came to me in July, 1930, was seventy-eight years of age. She had first noticed a tumor in her left breast three years before. There was no pain. At the time of seeing her, there was a four by five centimeter rock-like tumor two centimeters thick in the outer lower quadrant of the left breast, with one small gland in the axilla. She has had many courses of radiation, all conservative, and both radon and radium needle implants into the tumor and axillary gland, and now, nearly five years later, has a small hard nodule in the midline of the junction of the breast with the chest wall and a small hard axillary gland. The last roentgen irradiation was in March, 1935. It was given because of a slight enlargement of the axillary node. I again repeated my promise to her that, although I cannot free her of her tumor and that she must have treatment for the rest of her life, she will not die from it nor have any serious discomfort.

* * *

Case 2.—A woman of eighty-two, whom I first saw in November, 1932, had a four-centimeter tumor in the lower quadrant of the left breast, multiple smaller nodules in the upper quadrant and small clusters of axillary glands. The entire breast was swollen and tender, and the larger nodule, which was pushing up through the skin, was bluish with an erythematous apex and looked as though it were about to open and discharge. In October, 1933, at the last examination, she had a two-centimeter small, soft, flat, freely movable node in the breast with no palpable axillary nodule. In April, 1935, her physician told me that she was well and that the breast nodule could hardly be found.

* * *

Case 3.—In January, 1931, the third patient, who had passed ninety years, had a three-centimeter rock-like lump in the upper outer quadrant of the breast. This was attached to the skin and had the appearance of an old scar. There were palpable glands in the left axilla. I saw her last in February, 1935, eleven days after her ninety-fourth birthday. The growth was very slightly larger than when first seen, there was a two-centimeter clean ulcer in the center of a puckered mass, and the axillary nodes were enlarging. It is perfectly possible that this case would have grown as slowly without any treatment, but she was extremely worried about it and, as it shrunk immediately following each course of radiation, she at least was saved mental suffering. There is nothing more cruel than to tell a patient there is nothing to be done even if the physician himself knows that his efforts will produce no results.

The excruciating pain of bone metastases can be relieved for a greater or less time, and quite often permanently, by proper roentgen irradiation. In some instances, bone defects, as shown by roentgenograms, disappear or fill in with denser material. This procedure should never be neglected, as by its use relief may be obtained from the greatest suffering associated with breast cancer.

I may and probably shall be asked what technique or method of radiation should be used for such cases. The answer is radium in needles, radon in gold or platinum implants in a few, and the roentgen ray at 125 KVP to 225 KVP with filtration of from .25 millimeter to 2 millimeters of copper, depending on the case. Ports, size of dose, intervals between radiation, etc., is a matter of clinical judgment on the part of the radiologist and varies not only with the patient, but with the progress of the case. There can be no discussion of radiological technique in a paper such as this and there is no need of doing so, as such treatment can be given only by an experienced radiologist, and he is well aware of its possibilities and value.

Let me leave this message with all practitioners of medicine and surgery. No cancer of the breast, at any stage, is hopeless from the standpoint of relieving suffering and discomfort. Much can be done, and a physician is derelict in his duty if he does not avail himself of present knowledge and apply it in so far as he is able or the patient will permit.

* * *

CLINICAL PHASES AND TREATMENT

James F. Percy, M. D. (1030 South Alvarado Street, Los Angeles).—I know of nothing in the practice of medicine in which correct clinical diagnosis is more difficult than the determination of the nature of a lump in the breast of a man, woman, or child.

Our natural first inquiry today is, when one of these patients comes in to our office, is the tumor malignant, benign, or cystic? The latter may be a mixture of the former two. In this connection it is also well to keep in one's mind that curable palpable irregularities in the breast may be due to some form of hormonal or endocrine imbalance associated especially with the ovaries. I trust no reader of this article will ever be guilty of the often fatal advice sometimes given: "If it doesn't bother you, don't you bother it."

It is important not to confuse the endocrine physiologic cyclear congestion developing at the menstrual period, and in many women causing pain and enlargement of the breasts, to the chronic, non-painful, bilateral, lumpy, cystic breasts which Reclus described years ago.

I shall not describe the distinguishing aspects possible by transillumination of the breasts as an aid to the diagnosis of tumors therein.

We should remember, however, that mastitis (mazoplasia, Cheatle; mastoplasia, Whitehouse) carcinoma, fibro-adenoma, and cystic disease may exist simultaneously in the same breast. In addition, we may find tuberculosis, actinomycosis, Paget's disease, acute mastitis (even when not associated with lactation), fat necrosis and lipomas among our diagnostic problems.

Mass statistics on the frequency of benign or malignant growths of the breast are not helpful when we try to employ them to settle the nature of a lump in one of these organs of the new patient that we will probably see tomorrow. Within certain narrow limits, every search for the correct diagnosis as to the character of a breast tumor when first ventured, before a biopsy or its surgical removal, must, from the sort of a problem it usually is, be an enigmatical one. This remains so until its structure has been completely studied by a pathologist, and even then a negative microscopic report in an otherwise suspiciously malignant breast tumor is never conclusive as to its benignity. This is definitely so if the study and conclusions of the pathologist are based only on one or two slides from a rapidly frozen section.

If both breasts contain approximately an equal number of varying sized lumps or indefinite sensitive masses, the examiner can suspect a two-sided mastitis. It is also quite the rule in these bilateral lumpy breasts that the patient has recognized the trouble in but one. It should also be more generally known that cancer *in situ* gives a feeling of hardness or compactness to the experienced examining finger that is quite characteristic and rarely found in cystic disease of the breast, except it be thick-walled or fully distended. Likewise, statements about pain in one or both breasts by their possessor is important.

The more pain the less likelihood of the lumps being cancer. Reasonable handling of cancer anywhere in the body causes no response as expressed by wincing, unless it has become inflamed, while mastitis is always sensitive on manipulation.

It is surprising how many women who have lost a breast, or their ovaries or uterus, give a history of various phases of neurasthenia extending over a period of years. I sometimes wonder if the surgeon they first consulted had had a practical knowledge of some of the functional vagaries of the human nervous system, would his patient have been subjected to so much radical treatment? We should not forget that women are no exception to the possibility of their breast pain being due to an unstable nervous system, and their discomfort, therefore, a functional sensory problem rather than an organic one.

The doctor who believes, without adequate proof, the statements of any patient that he or she is suffering pain is skating on very thin diagnostic ice.

Every woman with a harassing breast that is not obviously diseased should be given a chance to clear up under medical treatment rather than as a routine make surgery the first method of choice.

If the abnormal mass is in the substance of one breast, and there is no similar lump in the opposite breast; and if it ranges in size from a ripe olive, or smaller, to that of a small orange, or larger, and is hard to the feel and not particularly sensitive, it is in all likelihood cancer.

If the patient has discovered the lump or lumps several months or even a year or two previously, and it has not appreciably grown, it is probably still in the benign class. It is very wise, however, for the reader to remember that the term "in all likelihood" employed above, and the additional one, "it is probably," are in no way diagnostic of anything, and, if depended upon in place of unimpeachable diagnostic evidence and methods as between mastitis and malignancy, the error may later cause great grief to the physician and to his patient, disaster.

No author so far as I know, except Jackson, has suggested coincident distant focal infections as etiologic factors in the persistence of what we are here generically calling chronic cystic mastitis.

The writer, ever since his attention was called to isolated focal areas as a fruitful source of this condition in the breast, has more than benefited a large percentage of patients by the following method:

First: Clean up the mouth, both from its dental and tonsil aspects and, as well, any other possible sources of infection outside of these two that may be found.

Second: Sagging or hanging breasts, unlike the gardens of Nebuchadnezzar, are never handsome or healthy. They should be maintained indefinitely, if necessary, in a position of anatomical normalcy, *i. e.*, straight back against the thorax by a well-fitting, but not tight, brassière.

Third: An important part of the treatment before the adjustment of the breasts in the brassière is the application of some form of alterative ointment which should be smeared over both breasts in a thin layer and covered with paraffin paper to hold it in place and to prevent soiling of the undergarments. The formula for the ointment for this purpose which has served me best for many years is the following:

℞
Pulv. phytolacca radix, dr. 3
(Sharpe & Dohme)
Lanolin
Ung't hydrarg. nitratis (U. S. P.) of each, dr. 4
(Citrine ointment)
Ung't petrolatum q. s. ad., oz. 3
M. Sig.:
Apply to the breasts every other day as directed.

Fourth: Two and one-half grains potassium iodid in a full glass of water three times a day.

How long should this treatment be continued in order to settle the diagnostic problem as between a mastitis and a malignancy? Two weeks. In this period of time the lumps due to a mastitis are distinctly smaller and less tender; in three to four weeks, if the treatment is continued, the breasts become essentially normal if the concurrent focal infections have been removed.

If many of the lumps disappear, but not all, leaving an isolated mass, it is either a thick-walled cyst containing fluid or a frank malignancy. Thick-walled cysts never entirely disappear under this treatment.

In this situation what should we do next? The answer: Make a liberal biopsy, *i. e.,* preferably the removal of the whole palpable mass under suspicion, and always with the actual cautery knife (not diathermy). The surface of the cavity remaining should then be infiltrated with heat from the ball-tipped cautery until its walls are like "horn or leather."

This insures the necessary heat penetration requisite to discourage a recurrence in the biopsied area should the laboratory pronounce it positive for cancer. To cut into a suspicious mass of tissue even with the cautery may result in a form of stimulation, should it be malignant, that may not be easily overcome by a radical removal later.

When should radical treatment for cancer following a positive laboratory report be instituted? *Immediately,* and by actual cautery knife excision and without pre- or postoperative radiotherapeutics. This advice also applies if the pathologist announces the specimen to be negative for cancer, but the condition for which the biopsy was done is extensive and clinically suspicious of carcinoma. It not infrequently happens that further research and study disclose cancer.

What shall we tell the patient about the necessity for a biopsy?

If the breasts clear under these preliminary therapeutic tests, or if this outcome follows the employment of the ovarian residue (Cheatle and Cutler) or Thelin (Whitehouse), the physician's statements to the patient as to the nature of her breast pathology can be encouragingly truthful. If, however, the masses do not clear, and if there remain one more or less definite firm tumor, the necessity for entire removal of the lump for purposes of study should be explained to the patient. If the biopsy, made with all precaution to prevent stimulation and dissemination of cancer cells proves positive, there are almost no exceptions in my experience to telling the patient that the laboratory reports her tumor cancer, and the urgency for the immediate radical removal of the breast.

If she then asks (as she most likely will), "Doctor, do you really think it is cancer?" he can and still should be enhearteningly loyal to scientific truth by not telling the victim she has no cancer, when she has, or calling it a tumor as a subterfuge for the real situation; because, not being the truth, such an answer is never completely satisfactory.

With the years, I have learned that a patient, when told that she probably has a fatal disease, rarely worries about dying longer than seventy-two hours. After that, the patient usually tires of the subject, dismisses it and becomes greatly interested and coöperative in attempting to find some method of escape from the "rendezvous with death." A hopeless prognosis usually drives these sufferers into the hands of medical frauds, including the religio-medical swindler, who can neither prevent nor moderate their suffering. No thoughtful or considerate physician will ever abandon these patients to such a fate when he has, to say the least, the wonderful resources of his own art in the way of medical palliation, and beyond this always the encouragement that comes from the hope of a possible cure.

Injection Treatment of Varicose Veins.—Colt and his collaborators found that the injection treatment of varicose veins with salicylate (40 per cent) saline (10 per cent) solution is safe and satisfactory in patients presenting a single varicosity, generally with a positive Trendelenburg sign, and a more extensive type of varicosity with a positive Trendelenburg sign and with a greater degree of deep reflux. Patients presenting a multiple spongework of small varicosities give poor results when treated in this manner. Although great amelioration takes place, a cure does not follow. It is as yet uncertain from the results published if more than amelioration can be obtained by operation, or by operation combined with injection, in this type of patient. In a small proportion of cases injection alone is not entirely successful, and ligation of the internal saphenous vein below its upper end is indicated as an adjuvant. No evidence sufficiently strong has yet been published to justify primary saphenous ligation in preference to primary injection with salicylate-saline solution. Almost all cases that have failed to react to other solutions can be successfully treated with salicylate-saline solution. The converse is not true, but sodium morrhuate appears to answer well in short lengths of vein when salicylate fails. Longer intervals than those commonly given between injections are evidently necessary if the accepted pathology of sclerosis is to be the guiding principle in treatment. Unna's paste bandage applied in the hydrostatic manner gives much better results than are obtained by the modern elastic-pressure applications.—*British Medical Journal.*

Traffic Accidents.—The Netherlands Central Bureau of Statistics has published for the first time a monograph giving detailed information on the causes of traffic accidents during 1932. All accidents on the public highways that caused substantial material damage and resulted in the death or injury of human beings are taken into consideration. The work reveals that in a total of 41,195 accidents the driver was responsible in 28,221 instances and the pedestrian was at fault in 2,975 cases. In 2,788 cases the bad condition of the road was the cause of the accident. In addition, there were 6,254 "diverse" causes. Collisions between bicycles or between a bicycle and other vehicle are most frequent, because of the large number of bicycles on the streets. To enumerate: There were 381 instances of a collision between a bicycle and a street car, 3,564 collisions between a bicycle and a truck, 7,336 with an automobile, 981 with a motorcycle, 2,928 with another bicycle, 145 with a pedestrian, 150 with a pushcart, and 559 with a horse-drawn vehicle.

Of collisions of an automobile with a street car there were 851 instances; with a truck, 3,215; with another automobile, 4,582; with a motorcycle, 1,067; with a bicycle, 7,336; with a pushcart, 556; with a horse-drawn vehicle, 835; and with a pedestrian, 1,441.

Of collisions of a truck with a street car there were 728 instances; with another truck, 1,617; with a motorcycle, 447; with a bicycle, 3,564; with a horse-drawn vehicle, 611; with a pushcart, 427; and with a pedestrian, 739. One should take account of the fact that 94 per cent of the vehicles were bicycles, 1.56 per cent were trucks, and 2.74 per cent were automobiles.

The source of information concerning the fate of persons seriously wounded is not reliable. Many communes have no infirmary. The wounded in that case are transported to the nearest city, where the consequences of the accident are often lost sight of.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section (Adv. pages 2, 4 and 6).

CALIFORNIA MEDICAL ASSOCIATION

ROBERT A. PEERS	President
EDWARD M. PALLETTE	President-Elect
FREDERICK C. WARNSHUIS	Secretary-Treasurer and Associate Editor for California

A NEW YEAR'S THOUGHT

The following is worth pondering over in these first days of a new year.

"All sciences are leading up to a better understanding of life and a consequent improvement of the physical, mental and moral powers of man. Medicine, preventive and curative, promises to do more and more for human welfare. If legislation and civil administration will keep up with science, if knowledge can be controlled by ethical standards and applied with temperance, if the organizations that we represent can be given support, encouragement and opportunity, there is no reason why the community of tomorrow may not be altogether free from most of the foes which in this and former generations have slain their tens of thousands."

And if the members of this Association will "capitalize on the opportunities which current pressures afford, building upon the foundations of sustained success already achieved, interpreting the dreams of the present for the dreamers of the future—thus we shall contribute to an ever richer understanding of the problems of human life, to the growing happiness of ourselves and those with whom we live and work, and shall see the results of our labors in a rising index of civilization."

In place of resolutions, often broken as soon as made, may the thought expressed serve as an inspiration during this year.

STATE AND COUNTY SOCIETY ACTIVITIES

COUNTY MEETINGS

President Peers and the State Secretary attended meetings of the following county units during December: San Joaquin, December 5; Merced, December 13; Stanislaus, December 13; Santa Clara, December 18; Kern, December 21; and Kings and Tulare, December 22 .

During January and February, engagements will be kept to meet with most all of the southern county societies.

* * *

ANNUAL CONFERENCE OF COUNTY SECRETARIES

On January 18, in the Sir Francis Drake Hotel in San Francisco, the annual conference of county secretaries with the officers and Council will be held. The following program has been arranged:

9:30 a. m.

Opening Statement—President Peers.
Value of Membership Affiliation—President-Elect Pallette.
Functions of the Council—Chairman T. Henshaw Kelly.
California and Western Medicine—Editor George H. Kress.
Legislation—Junius B. Harris.
Graduate Medicine—C. G. Toland.
Public Relations—C. A. Dukes.
Legal Services—Hartley F. Peart.
Luncheon.

1:30 p. m.

Round table: Questions and answers.
Membership Campaigns.
Secretary Reports.
Legislation.
Health Institutes.
County Programs.
Note: Secretaries are requested to send in questions.
Adjournment 4:30 p. m.

The Secretary is the most important county officer. The fundamental purpose of this conference is to enable each secretary to gain an intimate insight of the policies and functions of the State Association. In turn each secretary can transmit this knowledge to the members in his county.

The Council expects every county secretary to attend and also invites the presidents of county units to be present and join in the discussions. If you have any particular question you wish discussed, please send your question to the State Secretary.

* * *

1936 ANNUAL MEETING

The management of the Del Coronado Hotel reports that nearly all of their rooms have been reserved for our annual meeting the week of May 25. This indicates that the 1936 session will be the largest in the history of the Association. All room reservations must be made through the hotel management. Association officers do not hold any "block" reservations. Splendid hotel facilities remain in San Diego, twenty minutes from Coronado. Accommodations can be secured at these hotels: U. S. Grant Hotel, El Cortez Hotel, Pickwick Hotel, Hotel San Diego, Sandford Hotel, New Plaza Hotel, and Hotel St. James.

Section officers will meet in Los Angeles, January 12, to complete the final details of the scientific program. The program will be announced in the April journal.

Again it is urged that members write for their hotel reservations. This annual meeting will be well worth attending.

* * *

COUNCIL CONFERENCES

The Council is always seeking to conform to the wishes of the members and to the instructions of the House of Delegates. The Council invites and welcomes constructive recommendations. This has been evidenced in a large degree during the past year. During Council meetings conferences have been had with: Committee of Five; Legislative Committee; delegates from the Alameda, San Diego, and Sacramento county societies; representatives from the Dental Association; San Francisco Problems Group; individual Association members; Department of Health; Board of Medical Examiners; Attorney-General's office; members of the Legislature; and the State Bar.

The Council will always welcome a conference for the purpose of considering matters of vital interest to the Association. The same attitude is evidenced by all the officers and committees of the Association.

* * *

EXPRESSIONS OF OPINIONS

Postal Card Votes.—As imparted in the last issue, the Council directed that a postal-card expression and vote be obtained from members on a qualifying certificate (basic science) law and upon the question of health insurance. On November 19 a postal card (5,300 of them) was sent to every member to voice his personal expression in regard to a qualifying certificate law. The replies received were 2,049 for and 263 against such legislation.

On November 25 some 11,000 postal cards were sent to licensed physicians and surgeons in California requesting expressions by answering four questions on health insurance. Returns to date of January 2 are:

Against compulsory health insurance	2636
For compulsory health insurance	845
For voluntary health insurance	1615
Against any type of health insurance	1129

A more detailed study and tabulation of answers received will be made, and will be printed in the next issue. An effort will be made to tabulate the return by counties.

These personal expressions give a fairly representative picture of the profession's attitude toward these two questions, in addition to furnishing an insight to the personal opinions of medical men. See further report and comment in the February issue.

APPRECIATION OF CALIFORNIA'S PROFESSION

An eastern surgeon, a university regent, and a man who has visited many clinics and medical meetings, not only in this country but all over the world, wrote in a personal communication:

"After leaving San Francisco, Mrs. S. and I went to Southern California, gaining impressions of the country in general and medical conditions in particular. Incidentally, we met a great many old friends and had a thoroughly enjoyable and profitable time. I came home with renewed and fresh impressions of the excellence of the medical service performed by the good men of the profession out there. Certainly your standards are as high as any in the country and far better than in most parts of the country, and I think all of you there can be well satisfied with what you are doing. There is a certain newness and freshness, a tendency to break away from restricting traditions, and an enterprising spirit which is very apparent to one who visits California after a period of years."

If eastern men would do as this surgeon did, come and spend two or three weeks in California, see and mingle with our members and gain first-hand information—well, eyes would see the light and there would be a new and better understanding.

EXECUTIVE COMMITTEE*

Minutes of the Two Hundred and Twenty-Third Meeting of the Executive Committee of the California Medical Association

Held in the offices of the Association, Room 2004, Four Fifty Sutter Building, San Francisco, Sunday, December 1, 1935, at 9:45 a. m.

1. **Call to Order.**—The meeting was called to order by the chairman, Karl L. Schaupp, with the following members present: President Robert A. Peers, President-Elect Edward M. Pallette, Speaker W. W. Roblee, Chairman of Public Relations Charles A. Dukes, chairman of the Council T. Henshaw Kelly, chairman of the Auditing Committee Karl L. Schaupp, Editor George H. Kress, Secretary F. C. Warnshuis, and General Counsel Hartley F. Peart. Dr. Morton R. Gibbons and Emery Seeburt were also present.

2. **Board of Medical Examiners.** — On motion of President-Elect Pallette, seconded by Speaker Roblee, the following resolution was unanimously adopted:

WHEREAS, Since the year 1913, Dr. Charles B. Pinkham of San Mateo County, and a member of the San Francisco County Medical Society, acting as a member of the Board of Medical Examiners of the State of California and also secretary of that board, has for the last twenty-two years rendered most efficient service by protecting the citizens of the State of California from incompetent and illegal practitioners; and

WHEREAS, The term of office of Dr. C. B. Pinkham as a member of the Board will expire on January 15, 1936; now, therefore, be it

Resolved, That the California Medical Association, an organization of five thousand licensed doctors of medicine, through its Executive Committee, respectfully petition His Excellency, Governor Frank F. Merriam, asking him, at the proper time to reappoint Dr. Charles B. Pinkham as a member of the Board of Medical Examiners, so that his able work, which has received national and statewide recognition, be continued, to the benefit of the public health interests of California; and be it further

Resolved, That Dr. Robert A. Peers of Placer County, president of the California Medical Association, be authorized to present this resolution to His Excellency, Governor Frank F. Merriam.

The secretary was instructed to contact the county medical societies and request them to adopt similar resolutions and forward them to the Governor.

3. **San Diego Fair.**—The secretary reported that the San Diego Fair management had offered 20,000 square feet for a scientific medical exhibit under the auspices and control of the San Diego County Medical Society and the California Medical Association.

It was moved by Editor Kress, seconded by Speaker Roblee, that the Executive Committee endorse the project of a scientific exhibit at the San Diego Fair, as outlined by Secretary Warnshuis, and that President Peers be authorized to appoint a committee of five to represent the Association; and that there be no financial responsibility connected with the project on the part of the California Medical Association. Carried.

President Peers appointed as members of the Committee on the Exhibit for the San Diego Fair, Clarence G. Toland (chairman), E. M. Pallette, John C. Ruddock, Fred E. Clark, W. W. Roblee, C. O. Tanner; Robert A. Peers and F. C. Warnshuis, ex officio.

4. **Secretaries' Conference.**—It was moved by President Peers, seconded by President-Elect Pallette, that the secretary be instructed to write to each councilor urging him to encourage the attendance of county society secretaries or representatives from their individual districts at the County Secretaries' Conference on January 18, 1936. Carried.

5. **Clinical Laboratory Technologists and Technicians.**—The secretary presented a communication from the State Department of Public Health relating to the Attorney-General's opinion on an act relating to the conduct of clinical laboratory technologists and clinical laboratory technicians.

It was moved by Editor Kress, seconded by President Peers, that General Counsel Peart be requested to send a copy of the bill prepared on this subject to the secretary for transmittal to the Department of Public Relations of the California Medical Association and that the Department of Public Relations be requested to make a study of same, having in mind the protection of members of the Association specializing in clinical laboratory work; and further, that the Department of Public Relations, after consultation with Counselor Peart, send a copy of the revised draft to the California State Department of Health for the consideration of that body. Carried.

6. **Malpractice Insurance.** — Correspondence from the Los Angeles County Medical Association regarding group malpractice insurance was presented by the secretary, and discussed by the committee.

It was moved by Chairman of Public Relations Committee Dukes, seconded by Editor Kress, that the matter of malpractice insurance be referred to the Standing Committee on Medical Defense, of which Doctor Reinle is chairman, for study and report at the January 19 meeting of the Council; and that it be suggested to Doctor Reinle that Dr. Lowell Goin of Los Angeles be invited to confer with the Special Committee prior to the submission of the report. Carried.

7. **American Medical Association.**—The secretary read a letter addressed to the editor of *The Journal of the American Medical Association* regarding State Society news items, to which no reply had been received.

It was moved by President-Elect Pallette, seconded by Speaker Roblee, that the chairman of the Executive Committee be authorized to address a letter to the Board of Trustees of the American Medical Association calling their attention to the fact that various news items have been submitted to the editor of the *Journal*, which have not been published, and that other state secretaries have inquired and requested information as to activities in California. Carried.

---

* The minutes of the two hundred and twenty-second meeting of the Executive Committee of the California Medical Association were printed in the August, 1935, issue of CALIFORNIA AND WESTERN MEDICINE, page 164.

8. **Committee of Five.**—The secretary reported on the copyrighting of the report of the Committee of Five, and it was the sense of the committee that no action be taken at this time.

It was moved by Speaker Roblee, seconded by President-elect Pallette, that the secretary be instructed to request that all material collected by the Advisory Committee, the expense of which was defrayed with the funds advanced by the California Medical Association, be sent to the offices of the Association and that the secretary take such necessary steps as will secure possession of these records, graphs, and etchings. Carried.

9. **Referendums.**—The secretary presented a report on the votes on the Basic Science Act and health insurance problem, as of Saturday, November 30.

10. **Basic Science or Qualifying Certificate Act.**—Dr. Emery Seeburt of the San Francisco County Medical Problems Group addressed the Committee on the Qualifying Certificate Act, stating that it was the opinion of many groups and individuals in San Francisco that the Act should be sponsored by some organization other than the California Medical Association.

Chairman of Special Committee Kress reported that a meeting of the committee would be held this afternoon to prepare a tentative draft which will be presented to the secretary of the Association so that copies may be made and sent to all members of the Council and that the secretary would call a meeting of the committee for Saturday, December 14, at which time representatives of the Commonwealth Club, the Medical Problems Group, the Public Health League, the medical schools, and other interested bodies would be present; and that copies of the tentative draft will be presented and the subject opened for discussion, so that report thereon may be made at the meeting of the Council on January 19, 1936.

It was moved by Chairman of Public Relations Committee Dukes, seconded by President-Elect Pallette, that the report of the chairman be accepted and that a meeting of the Qualifying Certificate Act be held at the Sir Francis Drake Hotel on Saturday, December 14, 1936, at 9:30 a. m. Carried.

11. **Legal Department.**—The general counsel reported on the present status of the case of *Goodall* v. *Brite; Pacific Employers'* v. *Insurance Commissioner,* and *Francis* v. *Nelson.*

12. **Budget.**—The secretary presented the budget for the year 1936-1937, as submitted by the Auditing Committee, for approval by the Executive Committee.

It was moved by Chairman of Public Relations Committee Dukes, seconded by President Peers, that the budget be tentatively approved by the Executive Committee and copies be sent to each member of the Council for consideration prior to consideration by the Council at its January meeting. Carried.

13. **Taxes.**—It was moved by Chairman of Public Relations Dukes, seconded by President Peers, that we call to the attention of the American Medical Association its inactivity in protecting the profession against imposition of taxes. Carried.

14. **Adjournment.** — There being no further business the meeting adjourned at 12:30 p. m.

KARL L. SCHAUPP, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

COMPONENT COUNTY MEDICAL SOCIETIES

FRESNO COUNTY

The Fresno County Medical Society convened for its annual meeting on Tuesday evening, December 3, at the University Sequoia Club.

The meeting is especially worthy of comment, inasmuch as it not only marked the annual session of the Society with the election of officers, but it also served as the initial gathering for the proposed Woman's Auxiliary. Members and their wives attended in large numbers. Dinner was served to the mixed group, following which Mrs. William H. Sargent, state organizer of the Woman's Auxiliary, addressed the meeting, outlining the need and importance of the Auxiliary. Her remarks were particularly inspiring and heartily received. Following the dinner the women adjourned to attend their own organization meeting, the details of which appear elsewhere.

The regular order of business followed, with the reading of the minutes, reports of committees, and the announcement of three new applicants to the Society, namely, Drs. C. P. Doane, E. R. Cole, and M. M. Goldstein.

Election of officers followed, which resulted in the unanimous selection of the recommendation of the Nominating Committee, namely, Kenneth Staniford, president; J. M. Frawley, first vice-president; R. W. Dahlgren, second vice-president; Henry A. Randel, secretary-treasurer. Delegates: G. W. Walker, H. A. Randel, Neil Dau. Alternates: R. W. Dahlgren, K. Luechauer, E. R. Scarboro.

Dr. Walter Wiese, retiring president, addressed the assembly with a message of thanks to the entire membership, committees, and officers for their coöperation during the past year. Evidence of the membership's appreciation of Doctor Wiese for his untiring efforts was expressed by an enthusiastic applause.

The scientific program was devoted to a symposium on *Short-Wave Diathermy* delivered by Dr. John Severy Hibben of Pasadena and Doctor Breitweiser of the California Institute of Technology. The uses and abuses of this type of therapy were thoroughly discussed, as were the underlying physical principles of short wave. The program was thoroughly enjoyed by all those present. Demonstration of short-wave diathermy was made possible by the display of a machine of an approved make.

HENRY A. RANDEL, *Secretary.*

MONTEREY COUNTY

The regular meeting of the Monterey County Medical Society was held at the Forest Hill Hotel in Pacific Grove on Thursday evening, November 7. Dinner was served at 7 p. m., with twenty members present, after which President Davlin presided over the meeting which followed.

Election of officers for the ensuing year was held, with the following results: John Merrill of Monterey, president; Wiley Reeves of Salinas, vice-president; E. F. Kehr of Carmel, secretary-treasurer; Mast Wolfson of Monterey, delegate.

Councilor Alfred Phillips of Santa Cruz was present and gave a report on the special meeting of the Council and discussed the two proposed referendums. The clinical part of the meeting was presided over by Dr. Spencer Hoyt of Monterey, and was chiefly a symposium on the annual congress of the American College of Surgeons recently held in San Francisco, presented by Doctors Hoyt, Knox, Wolfson, and Lawler. Doctors Hoyt and Knox both illustrated their talk with lantern slides, Doctor Hoyt discussing chiefly *Diseases of the Genito-Urinary Tract* and Doctor Knox, *Deep X-Ray Therapy.* Doctor Wolfson took up several interesting medical subjects and Doctor Lawler reviewed the *Wax Collapse Treatment of Pulmonary Tuberculosis.* Doctor Mildick of Honolulu, a guest of Doctor Wolfson, gave an interesting talk on *Goiter in the Islands* and Doctor McPharlin gave a review of the *Stanford Rectal Clinic* of Doctor Scarborough, held last month.

* * *

The regular meeting of the Monterey County Medical Society was held Thursday evening, December 4, at San Lucia Inn, Salinas.

After the dinner President Davlin presided over a short business meeting, at which time Paul A. Lum of Carmel was voted in as a member, transferring from Merced County. Doctor Davlin then introduced the speakers of the evening, Ben H. Read, executive secretary of the Public Health League of California, Dr. Alson Kilgore and Dr. Glen Cushman of San Francisco. In a very interesting way they reviewed the work of the League during the past year and outlined somewhat the outlook for the coming year. The success of the meeting was well shown by the number that subscribed to the League and by the interest in the discussion which followed the talks.

William H. Lawler, *Secretary.*

⁂

ORANGE COUNTY

The regular meeting of the Orange County Medical Association was held in the chapel of the Orange County Hospital, December 3, at 8 p. m.

The election of officers was held, and as only one man was named for each office the secretary was instructed to cast a unanimous ballot in each case. The new officers are as follows: John Ball, president; W. S. Wehrly, vice-president; Glenn Curtis, secretary-treasurer; C. D. Ball, librarian; and L. Cameron, editor of the bulletin.

Dr. Calvert L. Emmons, the councilor for this district, spoke on *Compulsory Health Insurance and the Basic Science Law.*

Mr. Speed, manager of the Medical Bureau, gave an interesting report for this organization.

The meeting was then thrown open for a general discussion of any subject brought up for the good of the order.

Waldo S. Wehrly, *Secretary.*

⁂

SAN BERNARDINO COUNTY

The San Bernardino County Medical Society met on December 3, at the San Bernardino County Charity Hospital at 8 p. m. The meeting was called to order by the president.

There being no business to come before the Society the program of the evening was given as follows:

Case Report—*A Case of Purpura Hemorrhagica,* H. G. Gentry.

Symposium on Dermatology—*Unusual Cutaneous Manifestations of Syphilis,* Paul D. Foster; *Diagnosis and Treatment of Malignant Diseases of the Skin,* Nelson Paul Anderson; *Hypersensitive Dermatoses,* Samuel Ayres, Jr.

Officers for the coming year are: D. C. Mock, president; D. B. Williams, first vice-president; Gordon Helstrom, second vice-president; A. E. Varden, secretary-treasurer. Board of directors: K. L. Dole, R. C. Nichols, H. M. Walton, Walter Pritchard, and C. L. Emmons. Delegates: Walter Pritchard, H. M. Walton, and H. G. Gentry. Alternates: Carl M. Hadley, P. M. Lawler, and A. L. Weber.

A. E. Varden, *Secretary.*

⁂

SAN FRANCISCO COUNTY

At its regular meeting of December 9, the board of directors of the San Francisco County Medical Society endorsed the reappointment of Dr. Charles B. Pinkham to the secretaryship of the State Board of Medical Examiners.

The new officers and directors of the San Francisco County Medical Society, elected December 10, are as follows: Philip K. Gilman, president; Ethel D. Owen, first vice-president; H. Glenn Bell, second vice-president; Stanley H. Mentzer, secretary-treasurer; Frederick L. Reichert, librarian.

Directors for 1936-1938 are: Elbridge J. Best, Donald A. Carson, L. R. Chandler, G. D. Delprat, J. C. Geiger, Mary Jones-Mentzer, and Robert S. Stone.

Mary Jones Mentzer, *Secretary.*

⁂

SAN JOAQUIN COUNTY

The annual meeting of the San Joaquin County Medical Society was held at the new Basque Hotel, Stockton, December 5, Vice-President T. C. O'Connor presiding. The meeting was called to order at 7 p. m.

The first order of business was the reading of greetings from President C. A. Broaddus. The following resolution was presented by Dr. Dewey Powell, seconded by Dr. A. L. Van Meter, and carried:

"The members of the San Joaquin County Medical Society are deeply appreciative of the services rendered by their outgoing president, Dr. C. A. Broaddus. He has given generously of his time, his thought and his energy, and largely because of his personal leadership the Society has enjoyed a most successful year. The interest of the members, the excellence of the programs, and the conducting of a postgraduate course, attended by over one-half of the Society members, are all ample evidence that Doctor Broaddus has had a most outstanding year.

"The members of the Society regret that his illness of the past month has kept him from sharing in our annual meeting, and hearing personally the many deserved compliments that have been paid him. So we take this next best method of conveying by this resolution our appreciation of his untiring services in behalf of the Society, our sincere regret that his illness has prevented his presence tonight, and our hope that he will soon regain his health and be able to resume his many useful activities."

Dr. Neill Johnson reported on the activities of the Membership Committee. Dr. Dewey Powell, as chairman of the Public Relations Committee, presented the following resolution and moved that it be accepted. This was seconded by Doctor McGurk. The motion was carried.

Whereas, Dr. Nathan Barbour is conducting a heart clinic exclusively for the indigent sick abiding by the regulations set down in "A Standard of Clinics Organized for the Needy and Indigent," as published by the California Medical Association in January, 1932; and

Whereas, Doctor Barbour desires to offer one day each month to the personnel of the clinic and any interested member of this Society the postgraduate council of a teaching specialist; and

Whereas, It seems only fair and reasonable that such teaching specialist be paid a sum sufficient to cover his expenses and not to exceed $25; and

Whereas, Your Committee on Public Relations has investigated very carefully to determine whether this proposal violates the resolution of the council of the California Medical Association passed September 6, 1935; now, therefore, be it

Resolved, That the San Joaquin County Medical Society approve of the method of conducting a heart clinic for the indigent sick, including the securing of a teaching specialist one day each month; and be it further

Resolved, That this approval remain in force only as long as the clinic is conducted solely for the indigent sick, as now planned by Doctor Barbour.

Dr. Dewey Powell spoke about the immunization campaign of Doctor Sippy, and requested that the physicians as a whole coöperate with it. He also touched on the matter of the questionnaires which were recently submitted to the membership and requested that the membership respond. Doctor Sippy then spoke briefly on the immunization campaign that he was contemplating and reiterated Doctor Powell's request that the membership of the Society coöperate with the Health Center.

The transfer of Dr. O. E. Kuhn was acted on favorably by the Society. The application of Dr. John Rosasco for admission to the medical society was presented and read. This was ordered referred to the Admissions Committee.

Dr. Dewey Powell moved that the secretary be instructed to cast the ballot for the election of officers for the year of 1936. This was seconded by Doctor Dameron, and the motion was carried.

The question of the disposition of the old minutes of the San Joaquin County Medical Society was then taken up and, at the request of President Peers, Dr. Dewey Powell moved that all of the minutes, except for the last five years, be sent to the California Medical Association in San Francisco for storage and their files. This was seconded by Doctors Gallegos and Dameron, and the motion carried.

The annual report of the secretary on the activities of the medical society and the financial standing was then read and ordered filed by the president.

At the request of Doctor Schoff of Sacramento the following motion was presented by Dr. A. L. Van Meter:

Resolved, That the San Joaquin County Medical Society go on record and write Governor Merriam to that effect that they request the reappointment of Dr. Charles B. Pinkham to the Board of Medical Examiners on the expiration of his term of office January 15, 1936.

This was seconded by Doctor Sheldon, and the motion carried.

Dr. Axcel E. Anderson, councilor for the fourth district, spoke briefly on *State Medicine* and the activities of

20545

the various councilors of the California Medical Association and the activities of the Farm Bureau at their recent meeting in Santa Cruz.

Senator Dan Williams of Tuolumne County spoke briefly on the *Health Insurance Outlook for the State* and on the past activities of the Senate Interim on Social Insurance.

Doctors June B. Harris and Frederick F. Gundrum of Sacramento both spoke briefly on the various phases of the *Administration of the California Medical Association.*

President Peers' topic was *The Organization and Working of the California Medical Association.* This was a very entertaining and informative talk. Dr. Frederick Warnshuis, secretary of the California Medical Association, then gave the Society considerable information as to the *Internal Set-Up of the California Medical Association* and its responsibility to organized medicine. The topics presented by speakers of the evening led to lively discussion by Doctors Dewey Powell, Doughty, O'Donnell, Warnshuis, Dameron, Van Meter, and Peers.

G. H. ROHRBACHER, *Secretary.*

⁂

SAN LUIS OBISPO COUNTY

The October meeting of the San Luis Obispo County Medical Society was held on October 19 at Mulholland's Grill. Twenty-six doctors and six visitors (lay) were present. Dr. Junius B. Harris and Mr. Ben Read were the speakers of the evening, they discussing legislative procedures and problems which were considered by the last California Legislature and which will undoubtedly be considered by succeeding legislatures. They stated that it was very necessary that all members of the medical profession and allied and interested organizations would have to be on their toes and be ready to act, respectively, when those in constant contact with the legislators demanded it. Mr. Read encouraged everyone who had been members of the Public Health League in the past to pay their dues for next year, and also to attempt to get new members for the League. The local officers of the Public Health League were reëlected for next year.

* * *

The November meeting of the San Luis Obispo County Medical Society was held on November 16 at Mulholland's Grill. Sixteen members of the Society were present. The address of the evening was delivered by Dr. Morton Gibbons, he discussing some of the problems of industrial practice in California.

The membership application of Dr. Vernon L. Evans, a transfer from Los Angeles County, was submitted; also that of Dr. Justin A. Frank of Pismo, he having been elected to the Society in August.

F. W. YOCOM, *Secretary.*

⁂

SOLANO COUNTY

A regular meeting of the Solano County Medical Society was held Tuesday evening, December 10. At this meeting the new officers took up the work of the Society, Dr. Arvil Chappell succeeding Dr. Ambrose Ryan as president, and Dr. John W. Green succeeding Doctor Chappell as secretary-treasurer.

After routine business was transacted the Society heard a very interesting report of the work of the Public Health League, given by Mr. Ben Read. Doctor McGavack of San Francisco also spoke on behalf of the Public Health League, stressing the need of new members for the League. The president of the Solano County Medical Society appointed a committee of Society members to work with the Public Health League in Solano County.

JOHN W. GREEN, *Secretary.*

⁂

SONOMA COUNTY

At the regular annual meeting of the Sonoma County Medical Society, held on December 12, at which time, in addition to transacting routine business, reports of committees and officers for the year 1935 were received. Reports showed a membership of fifty-four members, a balance of $75.52 in the bank, and a very successful year's work for the Society.

The following officers were unanimously elected to serve the Society for the coming year: Paul T. Quarry of Santa Rosa, president; C. B. Andrews of Sonoma, vice-president; C. M. Carlson of Santa Rosa, secretary; L. W. Hines of Santa Rosa, treasurer. Dr. Chester Marsh of Sebastopol was elected to succeed himself on the board of censors for a three-year term, beginning January 1, 1936. A very interesting talk on hospitalization insurance was given by Mr. W. M. Bowman of Sacramento. Committees will be appointed by the incoming president.

W. C. SHIPLEY, *Secretary.*

⁂

STANISLAUS COUNTY

The regular monthly meeting of the Stanislaus County Medical Society was held at the Hotel Hughson, Modesto, on November 8 at 7:30 p. m. There were twelve members present.

Discussion on the matter of a postgraduate course, previously submitted for consideration, was postponed until the next meeting.

Election of officers was conducted, with the following men elected unanimously: Hans Hartman, president; J. K. Morris, vice-president; E. F. Hagedorn, secretary; D. L. Robertson, delegate.

The election of a censor was postponed until the next meeting to permit investigation of the provisions of the by-laws, with reference to this office.

The members were entertained by viewing a series of interesting and instructive films depicting the *Technique of Thoracoplasty.* These pictures were presented through the courtesy of Eli Lilly & Co.

E. F. HAGEDORN, *Secretary.*

⁂

TULARE COUNTY

The October meeting of the Tulare County Medical Society was held at Motley's Café, in Visalia, on October 20.

The following members and guests were in attendance: Doctors E. R. Zumwalt, McClure, Melvin, Annie Bond, P. D. Miller, Weiss, Cronemiller, Rosson, Ginsberg, Beck, Barber, Watke, Preston, Austin Miller, Guido, Fillmore, Dr. Hellbaum of Dinuba and Dr. Carl D. Benninghoven of Oakland.

Various communications were read. Dr. E. R. Zumwalt advised us of the availability of a trained physiotherapist for our residual poliomyelitis cases. He also stated that there were available limited amounts of Brodie vaccine.

Dr. J. Tracy Melvin gave an interesting informal report of his visit in South America, with particular reference to the hospital facilities found.

X-ray and radium therapy in relationship to surgery and the treatment of malignancy was the topic of the evening's paper, presented by Dr. Carl D. Benninghoven, radiologist of Oakland. Lantern slides were used to illustrate this interesting talk. KARL F. WEISS, *Secrtary.*

⁂

VENTURA COUNTY

The November meeting of the Ventura County Medical Society was held on Tuesday the 12th at the Ventura County Country Club at Saticoy.

There were twenty members and two guests present. The guests were: Doctors Phil Shumaker of Los Angeles and Henry J. Ullmann of Santa Barbara.

Following the dinner, Doctor Ullmann addressed the Society in regard to the Qualifying Certificate Act and Assembly Bill 246.

Dr. Harry E. Barker was unanimously elected to membership in the Society.

A discussion was held on the advisability of formulating a plan for hospital insurance, but since there is no apparent demand for such insurance in this county at the present time, no action was taken.

Communication in regard to the postgraduate courses was read. It was suggested that the secretary get in touch with the Santa Barbara and San Luis Obispo Societies and attempt to arrange for a joint meeting with them.

Doctor Strong then introduced Dr. Phil Shumaker, who delivered a paper on *Bronchoscopy and Its Relation to the General Practitioner*. This was followed by slides and a display of some of the various objects which he had removed.

* * *

The Ventura County Medical Society held its annual banquet and election of officers at the Saticoy Country Club on Tuesday, December 10.

Following the dinner the meeting was called to order by President Strong.

Communication in regard to Dr. Charles B. Pinkham was read. Doctor Osborn offered a resolution urging his reappointment by Governor Merriam. The resolution was seconded by Doctor Stoll, and unanimously carried.

The following officers, having no opposition, were unanimously elected for the coming year: Fred A. Shore of Ventura, president; F. R. Hendricks of Ventura, vice-president; A. A. Morrison of Santa Paula, secretary-treasurer. Alternate delegate, A. A. Morrison.

Dr. G. C. Coffey's term as delegate does not expire until next year at this time.

Discussion was held in regard to establishing a minimum fee schedule for the county. It was decided to collect such schedules as are available and attempt to formulate a satisfactory plan at a later meeting.

A. A. Morrison, *Secretary*.

⁂

YOLO-COLUSA-GLENN COUNTIES

The Yolo-Colusa-Glenn County Medical Society met in regular session in the Hotel Riverside at Colusa on December 3.

During the dinner Dr. Charles E. Schoff talked on matters pertaining to this councilor district, stressing the importance of keeping alert to political moves affecting public health and the practice of medicine in general.

The minutes of the previous meeting were read and corrected to state that Dr. Ney Salter of Williams was a member present at the previous meeting instead of a guest.

The board of censors voted favorably on admitting Dr. H. G. Potter to membership and receiving Dr. Joseph Tillotson by transfer from Sacramento County.

The following officers were elected: T. E. Cooper of Davis, president; Charles Roller of Colusa, vice-president; Ray E. Nichols of Woodland, secretary-treasurer. Delegate to state convention for two years, C. A. Poage of Colusa. Alternate delegate, Thomas Brown of Orland.

The secretary was instructed to send a letter to Governor Frank F. Merriam asking for retention of Dr. Charles B. Pinkham on the Board of Medical Examiners.

The following resolution was adopted in regard to the Superior California Hospital Association.

Whereas, the Superior California Hospital Association is a nonprofit organization; and

Whereas, Its sole purpose is to relieve the burdensome and usually the sudden large expense of hospitalization; and

Whereas, It had already been recommended and approved by the Sacramento County Medical Society and other northern California county medical societies; now be it

Resolved, That the Yolo-Colusa-Glenn County Medical Society endorse and approve the Superior California Hospital Association in its efforts to solve the problem of hospital cost and that such endorsement and approval be spread upon the minutes.

Dr. H. C. Bush of Alameda gave an interesting and practical talk on *Diagnosis and Treatment of Both Juvenile and Adult Tuberculosis.*

Ben Read gave a short talk on the *Political Activities of the Public Health League.*

A discussion of postgraduate courses was held, and because only nine members of the Society were present the secretary was instructed to write to all members and nonmembers, describing the course and to obtain a reaction from them so that plans could be made if sufficient interest were shown.

Dr. J. H. Woolsey was appointed as a committee of one to plan for the course if it is desired.

CHANGES IN MEMBERSHIP

New Members (10)

Kern County.—Chester I. Mead.

Los Angeles County.—Walter F. Kittle, John F. Plane, J. M. de los Reyes.

Riverside County.—Edward Keith Reekie.

San Francisco.—William Harrison, Robert C. McNaught, Robert P. Quirmbach, Frances A. Torrey.

Stanislaus County.—Ludwig H. Wolfsen.

Transferred (3)

Homer R. Evans, from San Bernardino County to Kern County.

Harrison W. Jones, from Stanislaus County to Kern County.

E. W. Henderson, from San Francisco County to Alameda County.

Resigned (1)

W. D. Martin, from Los Angeles County.

In Memoriam

Adler, Herman Morris. Died at Berkeley, December 6, 1935, age 59. Graduate of Columbia University College of Physicians and Surgeons, New York, 1901. Licensed in California in 1930. Doctor Adler was a member of the Alameda County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✣

Burbank, William Winston. Died at Long Beach, November 29, 1935, age 29. Graduate of Stanford University School of Medicine, San Francisco, 1931, and licensed in California the same year. Doctor Burbank was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✣

Dunlap, Florence Mary. Died at Los Angeles, November 13, 1935, age 47. Graduate of the University of Colorado School of Medicine, Denver, 1927. Licensed in California in 1931. Doctor Dunlap was a member of the Imperial County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✣

Johnson, Carl Arthur. Died at Napa, November 20, 1935, age 47. Graduate of the University of Illinois College of Medicine, Chicago, 1914. Licensed in California in 1923. Doctor Johnson was a member of the Napa County Medical Society, the California Medical Association, and the American Medical Association.

✣

Smith, Rea Everett. Died November 29, 1935, age 59. Graduate of the University of Pennsylvania School of Medicine, Philadelphia, 1902. Licensed in California in 1902. Doctor Smith was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✣

Wells, William Burdick. Died at Riverside, November 1, 1935, age 60. Graduate of the University of Illinois College of Medicine, Chicago, 1901, and licensed in California the same year. Doctor Wells was a member of the Riverside County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Membership Certificates

Upon payment of annual dues each member receives a certificate of membership. These certificates should be framed and displayed in the members' reception room. Such display will serve to acquaint your patients and friends with the fact that there is a county and state medical organization and that you are a member.

During the year the central office receives many lay inquiries on various subjects related to health and medical care. In the replies sent reference is always made to the county society and its members. The fact that you are a member is a valued asset, and your patients should be so informed. Pay your dues promptly, and frame and display your membership certificate. By doing so you may also induce some nonmember to apply for membership.

* * *

San Diego Fair

The San Diego Fair will reopen January 15th and continue through September 9. The Fair management has requested the San Diego County Medical Society and the California Medical Association to sponsor, direct, supervise and censor a scientific medical exhibit. A separate building, having 20,000 square feet of exhibit space, has been placed at our disposal. There will be no financial obligation or responsibility to the Association.

The Executive Committee, on December 1, authorized President Peers to appoint the following committee, which with a similar committee from San Diego, of which Dr. Lyle Kinney of San Diego is chairman, will be in charge of this Hall of Medical Science. The Association's committee consists of the following members: C. G. Toland (chairman), Edward M. Pallette, C. O. Tanner, John C. Ruddock, W. W. Roblee, and Fred B. Clarke.

* * *

Malpractice Insurance

An insurance company has sent out an announcement that on January 1 its rates will be increased 20 per cent. This increase is necessary, it is stated, because of increasing number of suits and larger judgments.

There are several factors that induce suits for which physicians are responsible. The number of suits will be reduced and premium rates will be lowered if physicians would observe the following recommendations:

1. Secure x-ray diagnosis by a roentgenologist in all cases of fracture or suspected fracture.
2. Demand and obtain competent consultations.
3. Keep accurate case records.
4. Be guarded in prognosis.
5. Do not prescribe over the telephone.
6. Refrain from making adverse comments or criticism of another physician's or surgeon's services.
7. Decline to make affidavits.
8. Decline to testify against another physician. You never know when you may be sued.
9. Do not sue for your services until the period of limitation has expired.
10. Do not discuss a case with an attorney or render an opinion.

Observance of these precautions will reduce malpractice suits.

* * *

How to Get Automobile Tax Exemption

The new tax levy on motor vehicles of 1.75 per cent of the market value of the vehicle, is effective January 1. Attorney-General Webb has ruled that veterans are exempt under the tax-exemption law and can apply their exemption to their automobiles if they desire.

It will be necessary, however, in order to obtain this exemption for the veteran to submit to the Motor Vehicle Department his discharge, or a copy of it, and must make affidavit of exemption. This will not exempt him from the usual $3 tax for license plates. For exemption on his other property he must submit similar proof and make affidavit before the county and city assessors.

* * *

Alameda County Health Institute

On November 4 and 5 the first Public Health Institute was conducted in Oakland, under the joint auspices of the Alameda County Auxiliary, Alameda County Medical Association, and the California Medical Association. Other organizations coöperating were the local and State Dental Associations, Anti-Tuberculosis Society, Parent-Teachers, Red Cross, Department of Health, and several other local organizations.

The institute was held in the Civic Auditorium. Some forty-five booths of visual education on health disease prevention and medical care occupied two-thirds of the auditorium. The institute was open to the public from 10 a. m. to 10 p. m. At stated hours during the day members of the Alameda County Medical Association gave demonstrations on some medical subject. A health lecture was given in the evening. Some ten thousand people attended the institute.

* * *

Taxes for Social Security

As far as we have been able to ascertain, this new federal and state tax on wages paid employees does not affect employers who have less than eight persons in their employ. There is some conflict because a state act says "four employes." We may expect a ruling on this conflict.

The following are exempted: agriculture, domestic service, casual labor, crew of a vessel, government employees, and employees of nonprofit organizations, employees of scientific organizations whose members do not receive profit financial dividends. Earnings of proprietors and partners.

It is stated that rules and regulations will be promulgated.

Members are cautioned not to consult local collectors lest a precedent be established. Once a ruling is made it is almost impossible to secure rescinding. If you are in doubt as to whether you come under this tax law, or if certain of your employees are affected by this law, send a statement of facts to the director of public relations. A ruling will be obtained from Counsel and you will be advised.

* * *

Diphtheria Immunization Campaign by the Alameda County Health Department

November 1 to November 15, 1935

For the campaign of immunization against diphtheria, the Alameda County Health Department this year determined to follow the plan suggested by the Public Health Committee of the California Medical Association as published in the September issue of California and Western Medicine.

On October 10 the county health officer held a meeting for the purpose of making preliminary plans with the five district health officers of the department. Letters were then sent out to the practicing physicians within the rural section of the county asking if they would be willing to administer toxoid for $1 per child in their offices if the campaign be limited to a short period, all materials to be furnished by the County Health Department. The physicians of the area were practically unanimous in their agreement to coöperate.

The plan was then submitted to the County Medical Association, and a letter was received by the health officer to the effect that the County Medical Association had given its approval for such a campaign. Approval was also obtained from the county superintendent of schools for the program to be carried on in connection with the rural schools.

Immediately thereafter the nurses of the County Health Department were provided with literature to be distributed in the schools. Information relative to the seriousness of diphtheria, the procedure for immunization and the plan of directing everyone to his own family physician was sent to all the papers, to churches, parent-teacher associations, service clubs, and civic groups. In the schools, new leaflets and additional information were circulated every few days so that probably no home in the county lacked information relative to the campaign.

---

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

This program of education led to a period of two weeks, from November 1 to November 15, during which time the physicians were to provide the treatment in their offices at the reduced fee. The County Health Department provided each physician with alum precipitated toxoid, in return for which the physician agreed to provide the Health Department with a list of those immunized, and also to immuniz free those who were certified by the nurse as being unable to pay.

The period of the campaign has now passed and, while the returns are not complete, it is apparent that approximately two thousand children have been immunized. The general reaction on the part of the physicians is one of enthusiasm for the campaign managed in this way. In previous years the physicians have usually donated their time to go to schools and immunize groups of children. Under this plan, while returns may not have been large, the physicians have received some remuneration for the work they have done.

The furnishing of toxoid by the Health Department has been appreciated by the physicians and by the people of the community, and this, we feel, is a legitimate expenditure for the Health Department. It is felt that a good piece of public health education has been accomplished, first by way of providing information about a specific disease, and second because many people have been taught to think in terms of going to their own physician's office for preventive service.

* * *

Hospital Insurance

The following action of the Council establishes the Association's policy and position in regard to hospital insurance.

10. *Hospital Insurance.*—Dr. Daniel Crosby, representative of the Alameda County Medical Society on the proposed hospital insurance plan in Alameda, stated that it was the desire of Alameda County to have the sanction and approval of the Council for the proposed hospital insurance plan in Alameda County.

As chairman of the Committee on Hospitals, Dispensaries, and Clinics, Doctor Crosby then presented the following recommendations to the Council on behalf of Dr. C. A. Dukes, chairman of the Committee on Public Relations:

"Pursuant to Council action, the Committee on Public Relations and the Committee on Hospitals, Dispensaries and Clinics, at a joint meeting held October 13, 1935, considered Assembly Bill 246. The following recommendations are made to the Council:

"1. The California Medical Association reaffirms its interest and its desire to coöperate with all other agencies looking forward toward the provision of hospital services for the people on the periodical payment plan.

"2. The California Medical Association believes that it is the duty of this organization and an obligation to assume leadership in this movement and make available and proffer advisory counsel to all agencies that propose to supply hospitalization facilities by means of an insurance plan as outlined and provided for in Assembly Bill 246 that was passed by the 1935 session of the Legislature and become a law on September 15, 1935.

"3. For the purpose of preventing untoward conditions and practices, the California Medical Association formulates the following governing policies that must be accepted and observed in every nonprofit corporation writing hospital insurance under Assembly Bill 246 in order that such corporation may secure the approval and endorsement of the California Medical Association.

GOVERNING PRINCIPLES

"1. Hospital services that are provided by nonprofit corporations shall not include medical services or medical care as these have been defined by official action of the House of Delegates of the American Medical Association.

"2. In all such propositions or plans that seek to provide hospital care, the individual shall be accorded a free choice of entering any approved hospital.

"3. The conditions or terms of any policy that provides for hospitalization shall not create an interference with the patient-physician relationship and shall give to the individual the right of free choice of a licensed physician and surgeon.

"Recommendation No. 1. Your committee recommends that the Council delegate to the Department of Public Relations the responsibility of approving the nonprofit corporation policies that are written for the purpose of providing hospital insurance.

"Recommendation No. 2. That the Council delegate to the Committee on Public Relations the authority to act in an advisory capacity to all hospitals, nonprofit corporations and county medical societies that purpose to issue hospital insurance policies.

C. A. Dukes
Daniel Crosby"

It was moved by President-Elect Pallette, seconded by Councilor Ullmann, that the report of the chairman of the Committee on Public Relations be adopted. Carried.

After discussion of the practice of pathology and radiology, on motion of Ullmann, seconded by Kress, the matter was referred to the Committee on Public Relations for the formulation of a resolution and report to the Council at its next meeting. Carried.

Several inquiries have been received and answered by the following letter:

December 12, 1935.

Dear Doctor:—Your recent communication addressed to Doctor Dukes on the question of policy in regard to hospital insurance was referred by him to this office for reply.

May I respectfully refer you to the December, 1935, issue of CALIFORNIA AND WESTERN MEDICINE, page 447, Item 10, of the Council Minutes on "Hospital Insurance"?

By that report you will gain insight as to the Association's policy. The Association through its Department of Public Relations is eager and ready to be of helpful assistance to every hospital or group of hospitals that plan to form a hospital insurance plan.

The Association, however, cannot at this time endorse any plan that includes the practice of medicine or corporate practice of medicine.

This department will be very willing to coöperate in an advisory capacity with any hospital considering insurance plans, but again by precedent and ruling, such requests and plans should first be referred to the proper officials of the county medical society for review and expression of opinion and, having done that, approach to this Association should be made through this department.

In developing a plan and solving features, I am sure you will find helpful suggestions by consulting the plan adopted by the Alameda County Medical Society, known as the "Alameda Plan."

Thanking you for your letter and assuring you of our ever readiness to be helpful, I am

Sincerely,
F. C. Warnshuis, *Secretary.*

This department stands ready to lend its services to the development of plans in order that the best interests of the public, the hospitals, and the profession are conserved. Just as hospitals are surveyed and approved by the College of Surgeons, so does the California Medical Association propose to function in regard to hospitalization insurance plans. When the Association approves a plan in any given location the public will know that the plan is a safe one and not a "racket."

THE WOMEN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. THOMAS J. CLARK ....President
MRS. ELMER BELT......Editor and Chairman of Publicity

County Auxiliary Reports

Los Angeles County.—The Pasadena members entertained the Woman's Auxiliary to the Los Angeles County Medical Association at a delightful luncheon held at the Pasadena Athletic Club on November 26, Mrs. John V. Barrow, the county president, presiding over the first part of the meeting. The spirit of the holiday season pervaded in the luxuriant decorations of flowers and fruits arranged by Mrs. Roy Miller, chairman of program, assisted by Mrs. Morris B. Lerned and Mrs. A. T. Newcomb. The meeting was honored by the presence of Mrs. Thomas J. Clark of Oakland, the state president, who spoke a few words in praise of the loyal support of the members of her board. Mrs. Barrow then presented the gavel to Mrs. Philip Schuyler Doane of Pasadena, who presided during the rest of the program. Mrs. Doane introduced several of the guests at the speakers' table, including Mrs. N. N. Brown of Bakersfield, the Kern County president; Mrs. Frank Andrews of Chicago, and Mrs. James F. Percy, recently returned from an eastern trip and bringing greetings from the State Auxiliary of Pennsylvania, whose meeting she attended.

---

† As county auxiliaries to the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Elmer Belt, chairman of the Publicity and Publications Committee, 2200 Live Oak Drive, Los Angeles. Brief reports of county auxiliary meetings will be welcomed by Mrs. Belt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the editor to allocate two pages in every issue for Woman's Auxiliary notes.

Mrs. Dale Park of the Home Consumers' Educational Bureau, and a representative of the Parent-Teachers' Association, briefly discussed group hospitalization and consumer education in the field of medical care. A file of the complete state membership of the Auxiliary with names and addresses listed by counties, which had been prepared by Mrs. Edgar Earwood of Hollywood, chairman of the State Mailing Committee, for the use of the state president, was presented to Mrs. Clark as a friendly tribute from the members of the Los Angeles County group.

The afternoon closed with an excellent musical program, which gave evidence of the talent and versatility of the Pasadena members. Mrs. William Arthur Clark sponsored the program, and the following artists participated: Mrs. Clark, violinist; Mrs. Schuyler Dunlap, cellist; Miss Gladys Howson, pianist; and Mrs. Clayton C. Snyder and Mrs. R. I. L. Smith, each of whom gave a group of delightful songs.

During the month the Harbor Branch of the county held their regular dinner meeting on the 22d, with Mrs. F. B. Settle presiding. The evening was given over to a discussion by the members of the Speakers' Bureau of the Woodrow Wilson Junior High School on the subject of the responsibility of scientific medicine to the community.

Another out-of-town group, the Glendale members, gave a dinner dance under the direction of Mrs. W. O. Leach. This was held on the 26th, and attended by eighty doctors and their wives at the Oakmount Country Club. During the after-dinner meetings, Mrs. John V. Barrow addressed the women, while Doctors Barrow and Malcolm Hill led the discussion in the men's group. After the business of the evening was dispensed, music, dancing, and cards were provided for the amusement of the guests.

The Huntington Park members entertained the county board and other guests at a very beautiful tea on December 3 at the home of Mrs. P. A. Gallant, Mrs. Clinton D. Hubbard acting as co-hostess. At the conclusion of a musical program and a talk by Mrs. Barrow, a social hour followed. These active suburban groups have aimed to interest eligible members, and as a result of their social endeavors the mailing list has been increased by about one hundred names this month.

Mrs. Harold E. Crowe, *Corresponding Secretary.*

* * *

Orange County.—The December meeting of the Woman's Auxiliary to the Orange County Medical Association, held on Tuesday, the third, at the home of Dr. and Mrs. H. A. Johnston in Anaheim, was an occasion of complete and satisfying beauty. Besides a large number of members, many guests eligible to membership were present. After a short business meeting, with Mrs. Ray C. Green in the chair, and a charming talk by Mrs. Johnston on increasing our membership, the afternoon was devoted to the rendition of the "Kreutzer Sonata" by well-known and well-loved Orange County artists. Mrs. Ernest Crozier Phillips interpreted Tolstoy's version, and Ollimae Matthews, violinist, and Earl Fraser, pianist, played two movements of Beethoven's "Kreutzer Sonata." The sonata, rendered in such warmly beautiful surroundings, was profoundly moving. Hostesses who aided Mrs. Johnston in serving the tea, which suggested the feeling of Christmas in its every detail, were Mesdames F. E. Coulter, C. A. Neighbors, H. D. Newkirk, C. S. O'Toole, George Paige, W. S. Wallace, and J. A. Wood.

In lieu of a separate meeting next month, the Auxiliary will join with the Medical Association in its regular installation banquet early in January.

Jessie Q. Raitt, *Publicity Chairman.*

* * *

Sacramento County.—The regular meeting of the Woman's Auxiliary to the Sacramento Society for Medical Improvement was held Tuesday evening, November 19, at the home of Dr. Burt Howard, with the president, Mrs. F. N. Scatena, presiding. In compliance with the Executive Board's wishes, Mrs. Scatena and the treasurer, Mrs. T. Binkley, reported that they had mailed letters to all members who were behind with their dues and that several had mailed in their checks at once. Mrs. Binkley reported seventy-six paid-up members. It was moved by Mrs. George Briggs, and seconded by Mrs. E. S. Babcock, that we donate our usual $5 to the Red Cross. Mrs. Scatena reported that Dr. O. S. Cook, president of the Sacramento Society for Medical Improvement, had appealed to her for workers to collect Red Cross memberships from the doctors. She appointed a team of six and, traveling in pairs, they canvassed the offices and reported a complete success in their drive. It was announced that the Christmas meeting will be held at the home of the president, Mrs. Scatena, with the Executive Board members as hostesses.

The business meeting adjourned, and the members enjoyed two piano selections by Miss Boyd ad a splendid review of the book, "Road to War" by Mellis, which was given by Mr. F. Melvyn Lawson of the History Department of the Sacramento High School. Doctor Howard's sister, Miss Nina Howard, presided as hostess and she was assisted by the following: Mesdames George J. Hall, E. Pitts, L. L. Mullin, Samuel Wells, H. Beauchamp, Harlan Smith of Fair Oaks, and Hugo Childress of Ione. Delicious refreshments were served during the social hour following the program.

Sarah L. Brendel, *Corresponding Secretary.*

* * *

San Diego County.—The regular meeting of the Woman's Auxiliary to the San Diego County Medical Society was held on November 12 at the San Diego Club. The honor guest was Mrs. Thomas J. Clark of Oakland, our state president. The luncheon tables were decorated with flowers and tapers in autumn shades of orange and yellow. Reports were given by the chairmen of the various committees in order to give Mrs. Clark a glimpse of the progress of the Auxiliary here.

Mrs. Charles Rees gave a refreshing survey of current medical topics, including the highlights from the recent convention in San Francisco. She stressed the importance of a basic science law and the desirability of having only one State Board of Examiners in order to prohibit the reckless granting of licenses to incompetent men.

Mrs. Clark graciously complimented the Auxiliary on its enthusiasm and interest. She feels that it is the duty of doctors' wives to join the Auxiliary as one means of showing genuine interest in the work of their husbands' profession. The organization was not formed for sociability alone, though that is also an important phase of the Auxiliary's endeavor. Mrs. Clark spoke in glowing terms of the Health Institute held in Oakland on November 4 and 5, and hopes that each Auxiliary will ultimately hold one.

Lucille Newton, *Secretary.*

* * *

San Francisco County.—In the summer of 1935 a number of the wives of physicians who belong to the San Francisco County Medical Society, realizing that their county medical society was one of the few organized groups in the State which were without a Woman's Auxiliary, became founders of such an organization by paying in advance a portion of their annual dues, such dues to be used toward defraying the expenses of organization. These founders were Mesdames Edward C. Bull, Henry H. Searls, Loren R. Chandler, Karl L. Schaupp, George S. Johnson, Rea E. Ashley, Dohrmann K. Pischel, Ludwig A. Emge, Gunther W. Nagel, Carleton Mathewson, Ralph Soto-Hall, Lewis Michelson, Albert V. Pettit, Harry E. Alderson, Donald E. King, and Harry J. Pruett. The first meeting was held September 10 in the rooms of the San Francisco County Medical Society.

The purpose and objects of this Auxiliary are to bring its members into more active affiliation with organized medicine, to coöperate with the San Francisco County Medical Society to conserve and protect public health, and to promote the betterment of the medical profession, to coöperate with organizations of like purposes in all desirable public health work and social welfare, and to become a component part of the Woman's Auxiliary to the California Medical Association. The very large number of doctors' wives who responded convinced the founders they had started an organization in the community which was to fulfill a long-desired want.

The following officers *pro tem* were elected to carry on the business of the Auxiliary until such time as a constitution, by-laws, and regular election of officers should be effected: President *pro tem,* Mrs. A. S. Musante; secretary-treasurer *pro tem,* Mrs. J. C. Geiger, together with the following chairmen of standing committees: Admissions, Mrs. T. H. McGavack; Membership, Mrs. Harry R. Oliver; Publicity, Mrs. Howard B. Dixson; Telephone, Mrs. Morrell E. Vecki; and Transportation, Mrs. Zura O. Waters. Since the first meeting on September 10 there have been three others on Tuesdays at 1:30 o'clock, and this has been voted the regular meeting time. The following additional committees have been appointed by the chair: Mrs. J. B. Herring and Mrs. Coleman A. Block, to act jointly, report on and then purchase the files, minute-book, and printed stationery for the Auxiliary; and a committee from the Auxiliary to help in any way needed during the clinical congress of the American College of Surgeons held in San Francisco the last of October. It consisted of the following: Mrs. Howard W. Fleming (chairman), Mrs. J. C. Geiger, Mrs. Z. O. Waters, Mrs. Edmund Butler, and Mrs. Rodney A. Yoell.

The Auxiliary is growing rapidly. Every mail brings in new applications for membership and an expressed desire to help the Auxiliary in any way possible. The Auxiliary in San Francisco attributes its rapid growth to the great assistance of the Woman's Auxiliary to the California Medical Association and to the help of the San Francisco County Medical Society. Wives, mothers, adult sisters and adult daughters of the physicians who are members of the California Medical Association are eligible for membership. We wish especially to thank Doctor Geiger, Dr. Mary Jones-Mentzer, and Dr. Dunlop Strickler, who have given of their time and wisdom to help us build a strong and an enduring Auxiliary.

Dr. J. C. Geiger, president of the San Francisco County Medical Society and Director of Public Health of San Francisco, was our first speaker, and Dr. T. Henshaw Kelly, chairman of the Council of the California Medical Association, was the second speaker. Both talked on public health legislation. Dr. Chauncey Leake, professor of pharmacology at the University of California, was the third speaker and chose as his subject, *Quacks and Quackery.* He urged the women of the Auxiliary to acquaint themselves with the policies of the medical profession regarding nostrums and quackery and to assist in spreading correct information to lay groups.

At the meeting on Tuesday, November 26, the Nominating Committee will propose a slate of officers. At that time it is also in order to have nominations from the floor, and it is hoped that all members of the Auxiliary will bear this in mind. Four members of the Nominating Committee were nominated and elected from the membership at large during the meeting of October 22; two members were elected by the *pro tem* officers and chairmen of standing committees at a called executive session. They are: Mesdames A. Lincoln Brown (chairman), Emmet Rixford, Thomas McGavack, S. R. Mettier, Z. O. Waters, and Coleman A. Block.

In closing this first report of the Auxiliary to the California Medical Association for their department in California and Western Medicine, we wish to express our thanks to that Auxiliary for its help during our organization and assure them we shall try to do our part as a component unit of the state organization.

Mrs. H. B. Dixon, *Publicity Chairman Pro Tem.*

NEVADA STATE MEDICAL ASSOCIATION

R. O. SCHOFIELD, Boulder City............................President
C. E. SECOR, Elko..President-Elect
HARRY W. SAWYER, Fallon..............First Vice-President
W. H. FROLICH, East Ely..................Second Vice-President
HORACE J. BROWN, Reno..
......Secretary-Treasurer and Associate Editor for Nevada

MINUTES OF THIRTY-SECOND ANNUAL SESSION

Proceedings of the First Day

The thirty-second annual meeting of the Nevada State Medical Association was called to order in the Elks' Hall of Elko, on October, 25, 1935, by President E. E. Hamer at 9:55 a. m. The president's address welcomed those present, and voiced his wish that the meeting would prove both pleasant and profitable. The scientific session was then taken up.

SCIENTIFIC SESSION

A. D. Pranger of Rochester, Minnesota, read a paper on *The Cross-Eyed Child.* No discussion.

John A. Fuller of Reno read a paper on *Common Eye Affections.* Discussed by H. Earl Belnap, A. D. Pranger, and R. Pendleton. The discussion was closed by John A. Fuller.

Eliot Snow of Salt Lake City, Utah, read a paper on *Branchial Cysts and Lateral Cervical Fistulae.* Discussed by R. A. Bowdle, Richard O. Schofield, E. F. Root, and Doctor Snow.

* * *

The meeting was then adjourned, and the members went to Smith's Restaurant, where an excellent luncheon was served.

* * *

Following luncheon, the scientific program was immediately resumed.

Edward S. Pomeroy of Salt Lake City, Utah, read a very interesting paper on *The True Status of Electro-Removal of the Prostate with the Endoscope.* Discussed by J. P. Tuttle, W. G. Schulte, C. W. Mayo, Eliot Snow, and Doctor Pomeroy.

C. W. Mayo of Rochester, Minnesota, read an interesting paper on *Unilateral and Bilateral Hernia: A Comparative Study of Postoperative Complications and the Factors Concerned.* Discussed by R. P. Roantree, R. A. Bowdle, R. Pendleton, and Doctor Mayo.

Nadina Kavinoky of Los Angeles, California, read a paper on *Birth Control.* No discussion.

BUSINESS MEETING

Upon completion of Doctor Kavinoky's talk, F. H. Harrison read a prepared resolution which purported to be in accordance with a resolution of the American Medical Association, also asking support of a bill now in Congress to permit the selling of birth control literature through the mails to physicians only. The motion was seconded by L. S. Bambauer. R. O. Schofield spoke in support of the first part of the resolution, as against the second part; and then offered an amendment providing that the matter be referred to the Judiciary Committee. Seconded by R. A. Bowdle, and carried.

The resolution was as follows:

Whereas, A condition of ill health and a number of deaths in the United States have resulted because of a lack of knowledge of scientific means of contraception; and

Whereas, It is against federal laws for physicians to secure information and supplies by mail, in order to properly advise their patients;

Resolved, We hereby memorialize the American Medical Association by commendation of the action taken by that body in the appointment of a committee to study legislation to permit physicians the legal use of mails for the purpose of securing scientific information and supplies for contraception. Also to urge a recommendation from that committee of favorable action on such legislation now pending in Congress.

The reading of the minutes of the preceding meeting was dispensed with on motion of O. Hovenden. Seconded by R. A. Bowdle.

The Report of the Delegate to the American Medical Association.—The delegate reported that he was unable to attend the annual meeting and was unable to find anyone who could go from this state. E. E. Hamer reported that he attended the special meeting held in February, 1935, as substitute for the delegate, and gave a report of the proceedings of that meeting.

NEW MEMBERS

New members were elected as follows: W. T. Burton, Albert G. Clark, H. B. Elkins, E. J. Garrison, Stanley L. Hardy, R. F. Jaekle, Frank J. Janssen, Walter C. Klein, J. R. McDaniel, William Nethery, Thomas G. O'Dell, F. M. Poulson, Hale B. Slavin, Ferris Summerbell, H. K. Wilson, George S. Weiss, and C. W. Woodbury.

NECROLOGY

The Necrology Committee reported the deaths of Dr. Thomas W. Bath and Dr. Noah Rouse. The committee offered a suitable memorial for Doctor Bath, which was accepted on motion of R. A. Bowdle and seconded by A. J. Hood. Following is the memorial:

Thomas W. Bath

Dr. Thomas W. Bath answered his last call on August 11, 1935. He was an outstanding surgeon in the community. He was an ardent student, sincere, and fearless of criticism when he knew he was in the right. A large part of his life was spent in public service. His untimely death leaves a gap that will be hard to fill.

Doctor Bath was born in Turfields, Wales, and came to Illinois when a little child, where he grew up and received his preliminary education. His medical degree was received from the College of Physicians and Surgeons of St. Louis in the year 1889.

He served in the United States Army in the war with Spain, also in the Philippines and in Cuba. In the World War he was commander of a base hospital in Southampton, England, and at the close of the war was retired with the rank of lieutenant-colonel, an honor of which he was justly proud.

Doctor Bath was a Fellow of the American College of Surgeons, Fellow of the American Medical Association, and a member of the Nevada State and Washoe County Medical Associations, being our faithful and earnest secretary for several years up to the time of his death. He was a member of the staff of both the St. Mary's and Washoe General hospitals.

It is the sense of this committee that the Nevada State Medical Association endorse these sentiments, and extend to the bereaved family our heartfelt sympathy; that a copy of this report be placed among the permanent records of the Society, and a copy be sent to his widow, Mrs. Lulu H. Bath.

HONORARY MEMBERSHIP

On motion of R. A. Bowdle, seconded by R. O. Schofield, the following were admitted to honorary membership: D. L. Alexander, Twin Falls, Idaho; Mrs. Nell Wells Alexander, Washington; John D. Ball, Santa Ana, California; A. W. Adson, Charles W. Mayo, and A. D. Prangon of Rochester, Minnesota; George Cochran, H. P. Kirtley, Edwin M. Neher, Edward S. Pomeroy, Eliot Snow, and R. Pendleton of Salt Lake City, Utah; Stella Hostetler, R. N., and C. E. Whitesides of Elko; Nadina R. Kavinoky, Los Angeles, California; Winifred W. Bambauer, R.N., Fernley; Thomas Lee, Sacramento, California; Beth McDermott, R. N., Wells; R. H. Travers, San Francisco; Lindsay B. Troxler of Philip Morris & Co., San Francisco.

AMENDMENT TO BY-LAWS

R. O. Schofield moved, seconded by A. C. Olmsted, the adoption of the amendment to the by-laws proposed at the last annual meeting. This provides that the first vice-president shall be advanced to president-elect; and the president-elect be advanced to president each year without a vote. Motion carried.

ELECTION OF OFFICERS

The following officers were elected to serve for the ensuing year, with the exception of the delegate to the American Medical Association, whose term is for two years, while the trustee is elected for three years: Second vice-president, W. H. Frolich of East Ely; secretary-treasurer, Horace J. Brown of Reno; trustee, D. A. Turner of Reno; delegate to the American Medical Association, Horace J. Brown; alternate, A. J. Hood of Elko.

ANNUAL SESSION FOR 1936

Moved by R. A. Bowdle, seconded by R. P. Roantree, that the next annual meeting be held at Bower's Mansion, Reno. Motion carried. R. A. Bowdle extended an invitation for the Association to hold its meeting in Ely in 1937.

Moved by O. Hovenden, seconded by R. A. Bowdle, that the secretary be instructed to write letters of thanks to the Elko County Medical Society, the Elko Chamber of Commerce, and the Elko Lodge of Elks. Carried.

FEDERAL RELIEF

Moved by R. A. Bowdle, seconded by O. Hovenden, that it be the consensus of opinion of the Nevada State Medical Association that the Army fee schedule shall be the minimum fee demanded for any service rendered anyone whose bill is to be paid by any Government relief agency. Motion carried. The secretary was instructed to send a copy of the Army fee schedule to each member of the Association, and to issue a bulletin containing the above resolution.

* * *

Proceedings of the Second Day

The meeting was called to order in the Elks' Hall at 9:20 a.m. on October 26, 1935, by President E. E. Hamer, and the scientific session was then resumed as follows:

A. W. Adson of Rochester, Minnesota, read a paper on *The Treatment of Dysmenorrhea and Hirschsprung's Disease by Sympathectomy.* Discussed by E. F. Root and Doctor Adson.

George Cochran of Salt Lake City, Utah, read a paper on *The Medical Management of Peptic Ulcer.* Discussed by L. S. Bambauer, A. C. Olmsted, J. P. Kerby, C. W. Mayo, R. Pendleton, E. S. Kilgore, and Doctor Cochran.

R. Pendleton of Salt Lake City, Utah, read a paper on *Treatment of Major Burns,* which was discussed by R. A. Bowdle, C. W. Mayo, R. O. Schofield, and Doctor Pendleton.

This completed the scientific program.

* * *

The following members were in attendance at various times during the meeting: Horace J. Brown, Lloyd S. Bambauer, Ralph A. Bowdle, H. Earl Belnap, John A. Fuller, O. Hovenden, D. J. Hurley, E. E. Hamer, Fleet H. Harrison, A. C. Olmsted, R. P. Roantree, R. O. Schofield, C. E. Secor, J. P. Tuttle, and J. E. Worden.

The following honorary members and visitors were also present at various times during the meeting: D. L. Alexander, Mrs. Nell Wells Alexander, A. W. Adson, John D. Ball, Winifred W. Bambauer, R. N., George Cochran, R. R. Hampton, Stella Hostetler, R. N., James P. Kerby, E. S. Kilgore, Nadina R. Kavinoky, H. P. Kirtley, Thomas Lee, Charles W. Mayo, Beth McDermott, R. N., Edwin M. Neher, R. E. Pendleton, A. D. Pranger, Edward S. Pomeroy, F. Poulson, E. F. Root, W. G. Schulte, Eliot Snow, R. H. Travers, C. E. Whitesides, R. T. Woolsey.

* * *

Dr. Richard O. Schofield of Boulder City was presented and seated as president for the incoming year by the outgoing president, E. E. Hamer of Carson City. Doctor Schofield made a very pleasing speech of acceptance, which was well received.

There being no further business the meeting was adjourned.

Horace J. Brown, *Secretary-Treasurer.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, Kansas City, Missouri, May 11-15, 1936. Olin West, M. D., 535 North Dearborn Street, Chicago, Illinois, Secretary.

California Medical Association, Coronado, May 25-28, 1936. Frederick C. Warnshuis, M. D., 450 Sutter Street, San Francisco, Secretary.

Western Section, American Laryngological, Rhinological and Otological Society, Del Monte, California, February 1-2, 1936. Carroll Smith, M. D., Paulsen Building, Spokane, Washington, Chairman.

Medical Broadcasts*

The American Medical Association broadcasts over the blue network and certain additional stations of the National Broadcasting Company at 5 p. m., eastern standard time (4 p. m. central standard time, 3 p. m., mountain time, 2 p. m. Pacific time), each Tuesday, presenting a dramatized program with incidental music under the general theme of "Medical Emergencies and How They Are Met." The title of the program is "Your Health." The program is recognizable by a musical salutation through which the voice of the announcer offers a toast: "Ladies and Gentlemen, Your Health!" The theme of the program is repeated each week in the opening announcement, which informs the listener that the same medical knowledge and the same doctors that are mobilized for the meeting of grave medical emergencies are available in every community, day and night, for the promotion of the health of the people. Each program will include a brief talk dealing with the central theme of the individual broadcast.

This program is broadcast also on the short waves through KDKA, Pittsburgh, over station W8XK, 11.870 and 12.210 kilocycles.

* * *

San Francisco County Medical Society. — The radio broadcast program for the San Francisco County Medical Society for the month of January is as follows:

Tuesday, January 7—KYA, 6 p. m.
Tuesday, January 14—KYA, 6 p. m.
Tuesday, January 21—KYA, 6 p. m.
Tuesday, January 28—KYA, 6 p. m.

* * *

Los Angeles County Medical Association.—The radio broadcast program for the Los Angeles County Medical Association for the month of January is as follows:

Saturday, January 4—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, January 4—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, January 7—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, January 11—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, January 11—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, January 14—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, January 18—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, January 18—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, January 21—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, January 25—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, January 25—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, January 28—KECA, 11:15 a. m. Subject: The Highway of Life.

Examination of Laboratory Technicians.—More than one hundred candidates for certificates enabling them to hold positions in the health service were just given examinations on the Los Angeles campus of the University of California. They came from all over the southern portion of California. They were attempting to qualify for positions as medical technicians or as clinical laboratory technicians. The examinations were given under the supervision of Dr. W. H. Kellogg, director of the State Board of Health Laboratories, on the Berkeley campus of the State University; Dr. R. V. Stone, director of the Los Angeles County Board of Health Laboratories; and Dr. T. D. Beckwith, professor of bacteriology, on the Los Angeles campus of the State University.

Heart Committee.—The Heart Committee of the San Francisco County Medical Society held its sixth annual symposium on heart disease on November 20-21. The program was arranged by Dr. William J. Kerr and Dr. Arthur Bloomfield. Sessions were held at the University of California, Stanford University, and San Francisco hospitals, and at the Department of Public Health. One hundred and eighty-one doctors registered for the course, representing fifty cities of California. The total attendance numbered 675.

The annual meeting of the Heart Committee was held on November 21 at the County Medical Society. The following officers were elected for the year 1936: J. Marion Read, chairman; John P. Strickler, vice-chairman; Amos U. Christie, secretary.

La Vina Sanatorium.—The La Vina Sanatorium will be rebuilt on the site of buildings which were destroyed with a $125,000 loss in the recent Altadena fire, Dr. Walter A. Hodges, medical director, announced recently.

Doctor Hodges revealed a portion of the loss was not covered by insurance and that the board of directors is accepting donations already toward the construction of the new and modern sanatorium. . . .

"The work at La Vina started twenty-five years ago and, while it is regrettable that the buildings erected by Doctor Stehman's friends and the memories that are attached to these buildings have been destroyed, we are very grateful that all patients were unharmed and safely removed; also that the hospital records were saved. During this period almost three thousand patients were treated at La Vina and many were restored to complete health and are now numbered among our useful citizens.

"While the fire loss is indeed regrettable, it is felt that with newly constructed buildings the splendid work of La Vina will be carried on to greater advantage than ever before. The good work of La Vina is evidenced by inquiries, interest, and sympathy of restored patients and friends who have called in large numbers.

"La Vina is a nonprofit institution under the supervision of a board of directors comprised of the following citizens of Pasadena: Dr. E. P. Clapp, president; J. E. Clifford, vice-president; S. Hazard Halstead, secretary; H. I. Stuart, treasurer; A. L. Rowland, Mrs. H. B. Stehman, General Charles S. Farnsworth, A. H. Fleming, and Dr. J. H. Breyer.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to California and Western Medicine, 450 Sutter Street, San Francisco, for inclusion in this column.

Federal Dole Figures.—Press dispatches from Washington give this information:

STATES MUST AID OWN UNEMPLOYED

U. S. Dole Ends; Nine Millions Allotted to California

Washington, November 29.—(Universal Service.)—Relief Administrator Hopkins announced tonight the federal dole has been abolished, and from now on every state in the Union will have to provide for its own needy unemployed.

The end of the dole was accomplished by arranging final grants to twenty-two states, including approximately nine million dollars for California, in the last few days. Some of the money these states received may be used during next month, officials admitted.

The dole this year cost the federal government $1,179,477,336, up to October 1. The bill from January 1, 1933, to last October 1 aggregated $2,725,907,904.

The "Dole" in Los Angeles County.—News items on this subject of December 6 in the Los Angeles *Examiner* follow:

"Los Angeles County families received $48,433,912 in federal funds as dole payments and as wages for work on relief projects during the last twelve months, according to figures released by the county relief administration.

"This huge sum, it was explained, does not take into account state or local funds expended for relief or expenditures for administrative costs, purchase of materials for projects and project personnel on full time.

"During the twelve months' period, the average number of relief cases has been in the neighborhood of 100,000. The highest case load of 110,065 was in April of this year.

* * *

Charity Recipients Demand Cash Dole

"Substitutions of a direct cash dole for the present arrangement of issuing food baskets to recipients of county charity was demanded by a group appearing yesterday before the County Supervisors.

"Representatives of various organizations whose membership extends among unemployed and charity recipients voiced the demand, and spread out before the Supervisors the purported contents of the standard food package for the officials' inspection.

"In a report read to the Supervisors from the county efficiency bureau, it was stated that to grant the dole request would increase food costs by 42 per cent, since the county buys by wholesale, whereas individuals would buy at retail.

"County Charities Superintendent Rex Thomson and the efficiency bureau were directed by the Supervisors, after the hearing, to make a survey of the situation, especially of those indigents who claim the need of special diets."

Philadelphia Proposed for 1936 American Medical Association Annual Session.—A letter from the Philadelphia County Medical Society states:

"The year 1937 will commemorate the one hundred and fiftieth anniversary of the signing of the Constitution of the United States of America. Two physicians, Dr. James McHenry of Maryland and Dr. Hugh Williamson of North Carolina, were among the signers.

"The American Medical Association was founded in Philadelphia in 1847. Philadelphia will be the pivot of all activities throughout the Union with respect to the celebration of this anniversary. It would be entirely fitting to have the American Medical Association commemorate its ninetieth birthday in its native environment.

"Philadelphia entertained the American Medical Association in 1931, the sentiment of that occasion speaking for itself.

"There has been started in Philadelphia a movement looking toward extending an invitation to the American Medical Association to hold its meetings in Philadelphia in 1937.

"The Philadelphia County Medical Society has adopted appropriate resolutions which were endorsed and heartily approved by the House of Delegates of the Medical Society of the State of Pennsylvania which met in Harrisburg in early October.

"We are asking you to press this invitation on your members and to your delegates to the American Medical Association. We hope the memory of our last meeting in Philadelphia will be such as will enable you to grant this favorable help."

American Board of Ophthalmology.—The 1936 examinations will be held in Kansas City, May 11, (at time of meeting of the American Medical Association) and in New York City in October (at time of meeting of the American Academy). All applications and case reports must be filed at least sixty days before date of examination. For information, syllabuses and application forms, please write to Dr. Thomas D. Allen, assistant secretary, 122 South Michigan Avenue, Chicago, Illinois.

A Martyr to Science: Woman Technician Dies in Study of Meningitis.—The Public Health Service on December 26 recorded on its special honor roll the first woman laboratory technician to die in line of disease-research duty—Anna Pabst, 39. Her life was the sixth sacrificed to scientific endeavor in the service in the last decade.

An animal Miss Pabst was injecting with meningitis serum, in the National Institute of Health Laboratories, December 17, squirmed suddenly, causing some of the culture to squirt in her eye. She was stricken with meningitis while Christmas shopping December 21 and died Christmas night.

War on Infantile Paralysis.—Discovery at the Rockefeller Institute of a nose wash, made from either tannic acid or sodium alum, which protects monkeys from infantile paralysis and is now ready "for trial in man," was reported to the Society of American Bacteriologists on December 26.

A second, entirely different sort of infantile paralysis preventive, found in Vitamin C, the vitamin from oranges, lemons, tomatoes, spinach, cabbage, and lettuce, was reported from Columbia University. The vitamin at Columbia prevented infantile paralysis in monkeys, but under circumstances so peculiar that the vitamin is not ready for trial on children.

News Dispatch: Vaccination with Serums Ordered Stopped by United States Public Health Service.—Vaccination of children against infantile paralysis with either of two widely used experimental serums has been stopped because of a warning by the United States Public Health Bureau that the vaccines are "dangerous," Dr. William H. Park, co-developer of one of the serums, disclosed in New York recently, after nine thousand children already had been vaccinated.

Dr. J. P. Leake, Director of the United States Health Bureau, in his warning to physicians to give up the serums, cited twelve instances in which children inoculated with the vaccines later became infected with paralysis. Six of these died.

First International Conference on Fever Therapy.—The first international meeting on fever therapy will be held in New York City, September, 1936. The use of fever induced by physical and other agencies as a therapeutic procedure has received universal attention in the past few years. Therapeutic, physiological and pathological phases of fever will be discussed.

The suggestion for this conference originated with a group of interested European physicians. Five national conferences have been held in the United States of America. The first three sessions met at Rochester University Medical School in 1931, 1932, and 1933. The fourth assembled at Columbia University College of Physicians and Surgeons in 1934. The fifth was held in 1935 at Miami Valley Hospital, Dayton, Ohio.

It is planned to translate abstracts of all the papers into French, English, and German. In order to make the printed copies of the transactions available for the conference, it is necessary that manuscripts and abstracts be sent in not later than June 1, 1936. Those interested in participating are requested to make early application.

Further information concerning the conference may be obtained from the secretary, Dr. William Bierman, 471 Park Avenue, New York City.

American College of Surgeons Places Los Angeles County Hospital on Approved List.—After years of whys and wherefores concerning the medical unit of the Los Angeles County "General" Hospital (the medical unit is now the Los Angeles County Hospital), the American College of Surgeons at its recent San Francisco session announced in its October Bulletin (Vol. 20, No. 3-A) that the Los Angeles County Hospital was on its approved list, a decision pleasing to the County Hospital authorities and to the more than one hundred Fellows of the College who are on the attending staff of the institution.

A New Problem in Alameda County: Social Medicine on the Ballot.—On December 13, the San Francisco *News* printed the following. (The item did not state whether funds were on hand to carry out the project!):

> Social Medicine to Go on Ballot
>
> East Bay local of the Socialist Party unanimously voted today to place before the electors of Alameda County in the November election an ordinance establishing a system of socialized medicine and dentistry. The ordinance will provide for complete medical and dental service, including hospitalization, for the entire population.

Recent Court of Appeal Decision.—The full opinion of the Court of Appeal mentioned below, printed on page 36 of this issue, is the ruling referred to in the clipping from the Los Angeles *Times*, which follows:

> Medical Aid Policy Void
>
> *Court Declares Insurance Company Cannot Practice Learned Professions*
>
> San Francisco, December 12.—(AP)—The State District Court of Appeal held medical service insurance policies are unlawful in California in a decision today which reversed that of a San Francisco Superior Court.
>
> The Pacific Employers' Insurance Company had obtained a writ of mandate in Superior Court ordering Samuel L. Carpenter, State Insurance Commissioner, to permit the policy to go on the market. The Appellate Court granted Carpenter's appeal, stating the company could not legally engage in "medicine and dentistry."
>
> The policy would have offered to pay hospital, medical and dental expenses for holders.

Cost to Public of Modern-Day Football.—Apropos of the subject, "Cost of Medical Care," the Los Angeles *Herald* of December 11 printed the following item on the "Cost of Modern Day Football":

> Bare College Grid Receipts at Coliseum
>
> The University of Southern California collected in its first six football games at the Coliseum this year a total of $243,940, according to a report of Roy A. Knox, director of the Municipal Bureau of the Budget, on file today. Figures on its last two games were not available.
>
> The University of California at Los Angeles took in at seven football games this year a total of $181,500. The biggest crowd—a $100,000 one—was the one attending the U. C. L. A.-California game.
>
> The preceding figures are gross receipts. Out of the sums collected the universities paid a proportion as rent to the city and county as operators of the Coliseum. This amounts to 20 per cent of the first $10,000 and 10 per cent of the rest.
>
> Total rental paid for the use of the Coliseum by both universities so far this year was $53,187—by U. S. C. $30,387 and by U. C. L. A. $22,800.
>
> Gate receipts for the U. S. C. games were estimated as follows: Montana, $12,110; College of the Pacific, $15,850; University of Illinois, $79,650; Oregon State, $23,330; Stanford, $93,000; and Washington State, $20,000.
>
> At the U. C. L. A. games these estimated sums were taken in: Utah State, $5,000; University of Oregon, $20,000; University of California, $100,000; Southern Methodist University, $45,000; University of Hawaii, $3,250; Loyola, $5,000; and University of Idaho, $3,250.
>
> Visiting teams are paid half of the gross receipts, out of which they pay traveling expenses. The home team pays the rental of the Coliseum out of its share and also the expenses of gatekeepers, watchmen, and incidental charges.
>
> The universities' share of Coliseum gate receipts is used to pay the expenses of baseball, track, rowing, ice skating, tennis, swimming, and other sports, besides expenses of the athletic administrator.

Third International Congress of Oto-Rhino-Laryngologists.—The third international congress of Oto-Rhino-Laryngologists is scheduled to be held in Berlin on August 17 to 22, 1936, immediately following the closing of the Olympic Games.

Doctor von Eicken, general secretary of the Organizing Committee, states that a large delegation is expected from the United States and Canada, and to this end a general invitation is being issued to all members of the American Ophthalmological, Otolaryngological, Laryngological, and Rhinological associations and societies.

Dr. John S. Hickman of Jamestown, New York, has just returned from Berlin and reports that the Organizing Committee is making elaborate plans for the congress, which will be one of the outstanding medical meetings in Europe in 1936.

Popular Medical Lectures.—The Stanford University School of Medicine announces the fifty-fourth course of popular medical lectures (illustrated) to be given at Lane Hall, north side of Sacramento Street, near Webster, on alternate Friday evenings at eight o'clock sharp.

The following lists the speakers and their subjects:

January 3—"Sinusitis, Allergy, and the Common Cold," Edward C. Sewall, M. D.

January 17—"Public, Patient, Physician, and Health Insurance," T. Henshaw Kelly, M. D.

January 31—"Superstitions, Facts, and Theories of Menstruation," C. Frederic Fluhmann, M. D.

February 14—"Success of Control of Communicable Diseases in San Francisco," George H. Becker, M. D.

February 28—"Value and Limitations of Plastic Operative Procedures," Albert D. Davis, D. D. S., M. D.

March 13—"Present Conceptions of the Nature of Mind," Thomas G. Inman, M. D.

"Bounty" Microscope One of Treasures at University of California Medical School.—Textbooks from which the old-time surgeon read while he conducted his operations, so that he would minimize the possibility of a mistake, a microscope taken from the effects of Captain William Bligh of the famous mutiny ship *Bounty* and many other interesting items are included in the exhibits of the recently opened Crummer Room at the University of California Medical School. The room has been named in honor of Dr. LeRoy Crummer (1874-1934), who inaugurated systematic instruction in medical history in the School.

A field medical kit used during the Franco-Prussian War, a set of instruments used by Dr. Beverly Cole, one of the founders of the Medical School, and two other microscopes dating from the seventeenth century, are among the actual surgical devices shown. In the collection of books are ten incunabula or "cradle books" printed before 1500. The oldest book in the collection is a Gerson of 1472, one of the earliest medical classics.

There are several copies of such important medical classics as Hippocrates, Galen, Paulus, Aegineta, Mesue, Vesalius, Phrysius, Harvey, Aselli, Malpighi, and others. There is a copy, in English, of the sixteenth century works of Ambrose Pare, famed Parisian surgeon, prepared by the same publisher who produced the first folio of Shakespeare's works. The bandages used by Hippocrates, "Father of Medicine," are shown in another ancient volume, while not the least important item of the interesting exhibit is a set of unique Ceylonese manuscripts.

Early American medicine is represented in the sere and yellowed classics of Waterhouse and Webster and many other volumes dealing with both early American and early California medicine are included in the collection.

The exhibit shows how completely the old practitioners mastered the fundamentals of medical science, as illustrated by their writings, and the technique of surgical instrument making.

The exhibit was made possible through the generosity of Mrs. Myrtle Crummer Ingram, widow of Doctor Crummer, who has placed his extensive library at the disposal of the School, and through donations made by a number of members of the medical profession.

State Medical Journals Using Copyright.—Last year California and Western Medicine copyrighted its contents. In the last few months several other state journals have taken similar action. The following letter from Secretary Crownhart of the State Medical Society of Wisconsin explains the general reasons:

> "Effective with the December issue of the *Wisconsin Medical Journal,* our society will copyright all editions. I take this first opportunity to advise you that we waive all copyright restrictions for bulletins or journals which are the official publications of any of the constituent state medical associations. Please feel free to make use of any material in our Journal at any time in event that you wish to quote it in part or in whole in your own official publications. In event of long quotations, however, we will appreciate your referring to the fact that it is copyright material.
>
> "The purpose of the copyright is to prevent misuse of material in our Journal by nonofficial publications and misstatements by those in the field of medical economics who are actively opposing the objectives of organized medicine."

New York Polyclinic Medical School and Hospital. At a meeting of the Clinical Society of the New York Polyclinic Medical School and Hospital held on November 4, the following program was presented: 1. "Contributory Causes of Coronary Thrombosis," Cadis Phipps of Tufts University. The discussion was opened by T. Stuart Hart and Louis Gross. 2. "Endothelial Tumors," Dean Lewis of Johns Hopkins University. The discussion was opened by Fred Waldorf Stewart, Nathan Chandler Foot, and David M. Bosworth.

At the December 2 meeting, the two contributions were: 1. "Changing Methods in Radiation Therapy in Malignant Diseases of the Uterus," William P. Healy of Memorial Hospital. The discussion was opened by Maurice Lenz, William Cameron, Malcolm Campbell. 2. "Surgery of the Pancreas," Allen O. Whipple. Discussion was opened by William Barclay Parsons, Ralph Colp, and Edward L. Kellogg.

Dr. Russell L. Cecil gave an afternoon lecture on Wednesday, November 20, on "The Types of Pneumonia."

The National Formulary, Sixth Edition.—The American Pharmaceutical Association announces that its council had officially approved December 16, 1935, as the date when the new National Formulary, sixth edition, was released for sale in all parts of the country, and has also approved June 1, 1936, as the date when the National Formulary, sixth edition, will become official and will supersede the National Formulary, fifth edition.

As previously announced, the National Formulary, sixth edition, will be distributed for the Association by the Mack Printing Company of Easton, Pennsylvania.

The new National Formulary represents a complete and thorough revision of National Formulary, fifth edition. Admissions and deletions are based on information obtained in the U. S. P.-N. F. Prescription Ingredient Survey. This survey was made to determine the materials prescribed and the extent of their use throughout the country. The National Formulary, sixth edition, therefore supplements the scope of the Pharmacopoeia and supplies additional information on samples, formulas, diagnostic reagents, and standards required by the pharmacist in the practice of his profession.

Of the 689 monographs in the National Formulary, sixth edition, 208 are drug or chemical monographs, and 481 are monographs of pharmaceutical preparations. The more important additions have been in the monographs for ampoules, tablets, fluidextracts, syrups, tinctures, and ointments.

Unsatisfactory Terms for Cause of Death. — From the standpoint of vital statistics the following terms are unsatisfactory:

Acute Indigestion—Give the cause.

Burns—State if burning building involved, also nature of burns, scalded or fire.

Bronchopneumonia—Under ten years always give contributory cause.

Cancer—Was the growth benign or malignant?

Childbirth—State fully as to actual cause.

Heart—Cardiorenal; state disease of heart and kidney fully.

Injury—What was the nature of the injury, and was it accidental, suicidal or homicidal?

Lung Trouble — Was it pulmonary tuberculosis? Was it lobar or bronchopneumonia?

Malignant Disease—Was it scarlet fever, diphtheria, cancer, or other disease, to which the very indefinite adjective "malignant" may be applied?

Malignant Sore Throat—Was not this diphtheria?

Malnutrition—What disease caused the malnutrition?

Marasmus—What disease caused the "marasmus"? Was it due to tuberculosis, syphilis, or cholera infantum? State fully, as this return in itself is practically worthless for compilation.

Meningitis—Was it epidemic cerebrospinal meningitis? If so, write exactly in this form, being particular not to omit the word "epidemic." Did it follow scarlet fever, pneumonia, or some acute infection? If so, name the primary disease. Was it traumatic? If so, state the nature of the violence which caused the meningitis. Was it tuberculosis meningitis?

Natural Causes—Name the disease causing death. The statement "natural causes" is entirely worthless, although frequently reported by coroners.

Nephritis—Was it acute or chronic, parenchymatous or interstitial? If acute, occurring in the course of some disease, name the disease causing death.

Paralysis—Give cause of paralysis, if known, or state definite form, as paralysis agitans, infantile paralysis, etc. Did the paralysis follow cerebral hemorrhage? Give the primary cause.

Paralysis of Heart—This is usually a mere synonym of "heart failure" and should never be used or accepted. See "heart failure."

Peritonitis—Give cause of peritonitis. Was it puerperal or traumatic? In the latter case, state mode of injury.

Pneumonia—Lobar or broncho.

Pulmonary Hemorrhage—Was it not due to pulmonary tuberculosis?

Pyemia—What caused the pyemia? Was it puerperal or traumatic? If traumatic, state nature of accident.

Rheumatism—State whether acute or chronic. If chronic, note any organic disease of the heart or other organs resulting therefrom.

Septicemia—See blood poisoning.

Spinal Trouble—Was this a disease of the spinal cord or of the spine and, in either case, what was the disease? Was it Pott's disease of the spine?

Stillborn—Never report a child as stillborn unless dead at birth. If the child survived any time whatever, the cause of death should be stated.

Stomach Trouble—Was it cancer, round ulcer, or other definite disease of stomach? State fully, as this, alone, is very indefinite and unsatisfactory.

Strangulation—Was this strangulation from disease (diphtheria), choking or hanging? If from disease, state fully. If from hanging, state whether suicidal or legal execution.

Suffocation—State very precisely the cause of the suffocation, as this term, returned alone, is very indefinite. See asphyxia.

Teething—Name disease affecting the teething child.

Tonsillitis—Was death not due to diphtheria? This is a suspicious return.

Toxemia—Was this acute or chronic poisoning due to some external agent? Was it autointoxication, due to poisons generated in the body by disease? If so, state the name of the disease.

Tuberculosis—State organ affected. Do not fail to state as pulmonary tuberculosis if lungs were affected.

Tumor—Was it a cancer? Whether a cancer or tumor, do not fail to specify organ or part of the body affected.

Ulcer—State location and cause.

Uremia or Uremic Poisoning—State cause of uremia. If due to an acute disease, the latter should be named as the cause of death. If in Bright's or other organic disease, state fully. Was it puerperal?

Violence—State form of violence and whether accidental, suicidal or homicidal.

LETTERS

Concerning constitutionality of law governing clinical laboratories.*

State of California
Legal Department: U. S. Webb, Attorney-General
San Francisco,
November 19, 1935.

Department of Public Health,
State of California,
State Building,
San Francisco, California.

Gentlemen:—Under date of August 16, 1935, there were presented to this office certain proposed regulations of the State Board of Health concerning clinical laboratories. The regulations purport to be those prepared pursuant to Chapter 638 of the Statutes of 1935, such chapter being entitled:

"An act relating to the conduct of clinical laboratory technologists and clinical laboratory technicians and the issuance of permits to physicians and surgeons conducting clinical laboratories for the purpose of protecting the public health and to provide penalties for the violation of the provisions of this act."

Since that time very careful consideration has been given to the proposed regulations as well as to the Act itself. Certain opinions concerning the Act have heretofore been rendered to you. These opinions dealt with specific questions, but did not touch the constitutionality of the Act.

The consideration given the proposed regulations has disclosed a situation, however, which causes us to conclude that the entire Act is unconstitutional and hence without force or effect.

Section 1 of the Act provides in effect that it shall be unlawful for any person in a clinical laboratory to make any test or examination requiring the application of one or more of the fundamental sciences therein named "unless said person possesses an unrevoked certificate issued one year from and after the date this Act becomes effective." This refers to technicians. The same section makes it unlawful for any person to make any test or examination requiring the application of one or more of such fundamental sciences unless such person "possesses an unrevoked certificate as a clinical laboratory technologist issued ninety days from and after the date this Act becomes effective."

Section 4 of the Act makes it the duty of the State Board of Public Health to issue a certificate of licensure within ninety days "to each person who shall within sixty days after this Act become effective, show proof of having complied with the qualifications of a clinical laboratory technologist as herein defined."

The same section also provides that it shall be unlawful for any person to act as a clinical laboratory technologist without certification as such from and after ninety days of the going into effect of this Act. It is also provided that it shall be unlawful for any laboratory or technologist or physician and surgeon conducting, maintaining or operating a laboratory to employ any technician except such technician be certified as provided in Section 1 of the Act.

You will note that the law does not provide for the issuance by the Board of a certificate of licensure to anyone who does not within sixty days from the effective date thereof show proof of having complied with the qualifications of a technologist.

You will also note that it is the duty of the Board to issue certificates of licensure to technicians found to be properly qualified; but you will likewise note that, according to Section 1, a technician must possess a certificate issued one year from and after the effective date of the Act and a technologist must possess a license issued ninety days from and after the effective date of the Act.

According to the established rules of statutory interpretation, the language "from and after," as used in Section 1, must be interpreted to mean within one year from and after in the first instance and within ninety days in the second instance. This must logically be so because according to Section 4 it is unlawful for a person to act as a technologist without having been certified within ninety days from and after the effective date of this Act.

It is likewise unlawful for any laboratory or person to employ a technician after one year from the date of enactment of the Act into law unless he be licensed. It must hence follow that only those persons can under this law be licensed who come within the purview of Section 3 of the Act as to technologists, and Sections 1 and 4 of the Act as to technicians. Consequently, all technologists must be issued a certificate of licensure within ninety days of the effective date of the Act and all technicians must be issued certificates of licensure within one year from and after the effective date of the Act.

We are forced to the conclusion that unless a person within these respective time limits qualifies for a license he can never receive one and that persons may not hereafter qualify as technologists or technicians because of the limiting language of the Act. This results in a discrimination without a reasonable basis for classification.

Aaroe v. *Crosby*, 48 Cal. App. 424.

There must be a reasonable and just relation to the things in respect to which a classification is imposed.

Barbier v. *Connelly*, 113 U. S. 27.

The statute would, therefore, appear to be unreasonable and arbitrary for the reason that it does not accord equal protection of the laws to all persons possessing the same qualifications as to education. The time when a person possesses certain qualifications is not a recognized method of regulating a business or profession. I am inclined to the view that the Supreme Court would hold that the legislature could not "under the guise of protecting the public, arbitrarily interfere with private business or prohibit lawful occupations or impose unreasonable and unnecessary restrictions upon them."

Liggett Co. v. *Baldridge*, 278 U. S. 105.

It is held in the case of *Louisiana State Board of Medical Examiners* v. *Fyfe*, 111 So. 58, that the State may regulate *within reasonable bounds* the practice of medicine and surgery. It is doubtful if it would be reasonable to permit licensure to those with certain qualifications on a given date and at the same time prohibit licensure to persons having superior qualifications at a subsequent date.

Very truly yours,

U. S. Webb, *Attorney-General.*
By Lionel Browne, *Deputy.*

Concerning baking soda-sodium fluoride poisonings in San Francisco.*

December 13, 1935.

To the Editor:—You have, no doubt, read of the recent deaths in San Francisco of some persons from accidental poisoning by sodium fluoride.

These cases are more remarkable in that there is so little in our medical literature relating to their occurrence. Herzog Medical Jurisprudence mentions cases in not recent accidental and suicidal poisonings in New York and Chicago. We have, in my experience in the San Francisco coroner's office, had two deaths, suicidal, one by ant paste, a white person; another by ant powder, a Chinese.

This is one of a variety of cases in the experience of a coroner's office where deaths happen from some cause where the occurrence, if anticipated, might have been prevented by necessary laws.

A somewhat similar case occurred in San Francisco some years ago, where a concern manufacturing oxygen and hydrogen gas put out, accidentally, a highly explosive mixture of oxygen and hydrogen, which, being used for welding purposes, caused an explosion. The coroner's office immediately examined samples of gas under the same serial number, and finding it to be explosive, by telegram and otherwise, called in all tanks of that serial number, but not before another explosion occurred at a distant point. At the inquest following, the company concerned, through its chemists, was about to prove the explosion to have been an "act of God" when two laborers in the works, suddenly called in by the coroner, testified that in their work of cleaning the batteries they had accidentally disconnected some of the wires and had evidently misplaced them, disarranging the poles. The accident was evidently due to the fact that a young man had been elevated to the position of superintendent of the concern who had not the education in chemistry necessary to direct such important work.

---

* See also editorial comment, page 3.

* See also news item printed in December California and Western Medicine, page 455.

We have also had a variety of cases of food poisoning, for example, the *Promethius* disaster where, at the launching of said vessel, a San Francisco caterer supplied a cold luncheon and the potato salad was contaminated, some deaths ensuing, and scores of people made ill. A variety of ptomain poisoning was demonstrated.

We have also had cases where numerous people were infected with trichinosis from eating sausage made of meats not properly inspected.

These events in the life of a coroner crop up at unexpected intervals. All accidents might have been prevented if the cause had been anticipated and necessary legislation enacted. It seems too bad that most of our safety laws, laws for the conservation of human life, must be based upon and follow the death of martyrs to the cause.

In these cases concerned the accident was caused, evidently, by lack of necessary legislation or regulations regarding the distribution or sale of commercial poisons to salvage companies. A barrel of sodium fluoride, part of a large consignment of sodium fluoride shipped through a steamship company to a firm in San Francisco, was damaged in transit and evidently sold to a local salvage company, where it remained on the floor for a considerable length of time.

The purchaser for a large advertising grocery concern, on visiting the salvage company's place of business, saw an unopened barrel of Arm and Hammer brand soda. Inquiring of the salvage people if they had more on hand, and being answered in the affirmative, he told them to send out to his concern all they had. Part of the materials on hand were damaged cases of Arm and Hammer brand in their labeled cartons. These were opened and dumped into barrels. The warehouse man making up the consignment searched through the building for other barrels of soda, and inadvertently included in his collection this damaged barrel of sodium fluoride, which, with some five other open barrels of supposed soda, he delivered to the grocery concern. The contents of only one barrel was tested by this man, this by taste and feel.

These were received by an employee of the grocery store without check or examination and placed on sale, part of which was made into one-pound paper packages marked, in lead pencil, "baking soda." The rest, in open barrels, was scooped out to the individual purchaser in two, three, or five-pound lots, as purchaser desired.

As the barrels became partly depleted, they were, for sales purposes, kept refilled from other barrels. Packages of sodium fluoride without soda were sold as baking soda. Other packages contained mixed soda and fluoride.

Arsenic was found by the chemist of the Department of Public Health in a preliminary test of packages as the major poison, the coroner's chemist finding fluoride as the major poison, also arsenic present in small but variable nontoxic quantities. The presence of sodium fluoride and arsenic at first led to the possibility of insecticide being the source of the trouble. From an authoritative source it was reported that arsenic is present as an impurity in commercial sodium fluoride. Inspectors George Engler and Allan McGinn of the San Francisco Police Department, who were detailed on the case, taking this as a cue began a search for commercial sodium fluoride, which they eventually found and traced from its source to the warehouse, grocery store, and consumer. The finding of our city chemist of the variable presence of arsenic in nontoxic quantities in samples examined was not completely in accord with the theory of arsenic as an impurity of commercial sodium fluoride. A check by the chemist of the U. S. Food and Drug Administration at San Francisco, Mr. Alfred K. Klein, found that the reaction for arsenic was due to the action of hydrofluoric acid upon arsenic contaminated glass bottles used in the test for sodium fluoride. This finding was communicated to the director of our local Board of Health and to the coroner.

Mr. G. J. Morton, chief of the U. S. Food and Drug Administration at San Francisco, has been most accommodating in extending the services of his corps of chemists and well-equipped laboratory, and is conducting further research into the possible presence of arsenic in commercial sodium fluoride.

From a recent book on toxicology the dose to cause toxic symptoms was determined to be 5 grams (77 grains), roughly, one and one-sixth teaspoonfuls; the lethal dose, 10 grams (154 grains) roughly, two and one-half teaspoonfuls. The large lethal dose possibly prevented other deaths.

Three deaths were caused, evidently by the poisonous sodium fluoride, although in two cases the hearts were diseased and the poisons may have been only contributory, and a few people were made ill. The wide publicity immediately given through press and radio saved other lives. About 375 packages are still unaccounted for.

Sodium fluoride melts at 982 degrees centigrade or 1799 degrees Fahrenheit. Acid vapors are evolved at 128 degrees centigrade or 262 degrees Fahrenheit, a possible menace to firemen when quantities are stored in a burning warehouse.

The menace of aged canned and other food materials offered at sales to unsuspecting purchasers was brought out.

The jury's verdict and recommendation follows:

> We, the jury, find that Mary Catherine Ogle, Bessie M. Shufelt, and Albert F. Perry came to their deaths after using baking soda with a mixture of sodium fluoride purchased from Rosenthal's Department Store.
>
> We, the jury, charge both Manno Salvage Company and Rosenthal's Department Store with criminal negligence in the careless handling of the above mixture which resulted in the foregoing deaths.
>
> We, the jury, recommend that the Director of Public Health make a survey of the situation resulting in these deaths and draw up necessary legislation or regulations to prevent a recurrence of this tragedy; and further recommend to the Board of Supervisors that this legislation recommended by the Director of Public Health be passed and appropriate funds be furnished for carrying out this legislation.

Already the necessary steps have been taken to pass legislation governing the control of the purchase and sale of industrial poisons and foodstuffs by salvage companies, this by national, state, and local agencies.

Trusting that this will afford you material for necessary comment which may lead to the further safeguarding of lives of our citizens in the line of food and drug consumption, I remain

Very sincerely,
THOMAS W. B. LELAND, M. D.,
Coroner, City and County of San Francisco.

Concerning the practice of obstetrics.

STATE OF CALIFORNIA
Legal Department
San Francisco,
November 19, 1935.

Dr. C. B. Pinkham,
Secretary-Treasurer,
Board of Medical Examiners,
State Building Annex,
San Francisco, California.

Dear Sir:—In your communication of October 28, 1935, you enclosed a copy of a birth certificate filed with the registrar at Ontario, California, under date of October 17, 1935. You ask whether a chiropractor has the right to do obstetrics and point out that the child in this instance was attended by such a licentiate.

In reply permit me to state that a chiropractor has no right to hold himself out as being entitled to do obstetrics. This office has on many occasions expressed its view that a chiropractic license, which is, according to Section 7 of the Act, a license to practice chiropractic, authorizes the holder thereof to practice chiropractic and that obstetrics is not included in the field of chiropractic.

I may call to your attention, however, the provisions of Section 22 of the Medical Practice Act, which provides that "nothing in this act shall be construed to prohibit service in the case of emergency." Your letter does not indicate whether the chiropractor in question was rendering an emergency service or otherwise. Such is a question of fact which should be determined before any action is taken by or on behalf of the Board.

Section 13 of the Vital Statistics Registration Law, Statutes of 1915, p. 378, as amended, requires in part, with reference to the obligation of certain persons to file birth certificates:

"In case no physician was in attendance it shall be the duty of the midwife or person acting as midwife to file such certificate."

It would, hence, seem to be the obligation of a chiropractor to file a certificate where he attended the birth of a child, and there is nothing in the state law to prohibit his using the suffix "D. C." in carrying out the obligation imposed upon him pursuant to said law.

Very truly yours,
U. S. Webb, *Attorney-General.*
By (Signed) Lionel Browne, *Deputy.*

* * *

Honorable U. S. Webb, Attorney-General,
State Building,
San Francisco, California.

Yours of November 19, re: Chiropractors practicing obstetrics, Opinion No. 10357.

Attention: Lionel Browne, Deputy

Dear Sir:—Many thanks for your opinion (No. 10357) reiterating prior opinions that a licensed chiropractor "has no right to hold himself out as being entitled to do obstetrics," said opinion answering ours of October 28, 1935, to which was attached a birth certificate signed Walter F. Wright, D. C., which certificate was not returned as requested in our letter.

Your opinion indicates that although a chiropractor "has no right to hold himself out as being entitled to do obstetrics," yet because of the phraseology of Section 13 of the Vital Statistics Registration Law, Statutes of 1915, page 378, as amended, a chiropractor may do obstetrics.

This appears to be an instance where the law controlling one commission prohibits a certain thing, whereas the law controlling another state department permits it.

At your convenience, would appreciate the return of the birth certificate issued in the name of Barbara Ann Sarason signed Walter F. Wright, D. C., mentioned in the last paragraph of ours of October 28, 1935.

Very truly yours,
C. B. Pinkham, M. D.,
Secretary-Treasurer.

Concerning publicity given to Red Cross Christmas seal.

To the Editor:—Please allow me to express to you, in behalf of our national officers, our very sincere appreciation for the generous contribution of space which you gave to the American Red Cross in California and Western Medicine. It is only through the splendid coöperation which you and others give to us each November that we are enabled to extend a universal invitation to all Americans everywhere to participate in Red Cross work through individual memberships.

Cordially yours,
Douglas Griesemer,
Director of Roll Call.

Concerning resignation from hospital.

December 7, 1935.

To the Editor:—May I ask you to put in an appropriate place, as a news item, in the Journal something to the following effect:

"Dr. Alfred C. Reed has resigned from the board of directors and staff of Mary's Help Hospital in San Francisco."

Very truly yours,
Alfred C. Reed.

Concerning prize awards for essays on goiter problem.

American Association for the Study of Goiter

To the Editor: — The American Association for the Study of Goiter again offers the Van Meter prize award of $300 and two honorable mentions for the best essays submitted on the goiter problem. This award will be made at the discretion of the society at its next annual meeting to be held in Chicago, Illinois, on June 8, 9, and 10, 1936.

The competing manuscripts, which should not exceed three thousand words in length, must be presented in English and a typewritten double-spaced copy sent to the corresponding secretary, Dr. W. Blair Mosser, 133 Biddle Street, Kane, Pennsylvania, not later than March 1, 1936. Manuscripts received after this date will be held for competition the next year or returned at the author's request. . . .

Very truly yours,
W. Blair Mosser.

SPECIAL ARTICLES

CALIFORNIA CITIES MAINTAIN LOWEST INFANT MORTALITY RATES

California cities again score in the maintenance of the lowest infant mortality rates for cities in the various classifications of population. Among cities having populations of 250,000 and over, San Francisco in 1934 had an infant mortality rate of thirty-three, the lowest of any cities having similar populations throughout the United States. Portland, Oregon, with a rate of thirty-six, secured the second lowest such rate in this classification of population, and Oakland, with a rate of forty, had the third lowest infant mortality rate among large cities of the United States.

Among cities having populations of 100,000 to 250,000, Long Beach with a rate of thirty-one had the lowest infant mortality rate of all cities in this classification of population. The next lowest rates among such cities were secured by Lynn, Massachusetts, and New Haven, Connecticut.

Among cities having populations between 50,000 and 100,000, San Jose, with a rate of nineteen, had the lowest infant mortality rate of all cities having similar populations. New Rochelle, New York, and Evanston, Illinois, with rates of twenty-four and twenty-one, respectively, followed San Jose in maintaining the lowest such rates among cities having similar populations.

No comparisons have been made for cities with populations of less than 50,000 since many cities reported too few births in 1934 to yield reliable annual rates.

These remarkable records of California cities have been maintained over a considerable period of years. Until this year, northwestern cities have maintained the lowest records among large cities of the United States, but now San Francisco, with the low rate of thirty-three, makes the most favorable record of any large city in the country.

The people of San Francisco, Oakland, Long Beach, and San Jose may well be proud of this remarkable record. It is doubtful that any other index to general health conditions can be comparable to that provided by the infant mortality rate. If conditions that are favorable toward the saving of infant lives prevail in any community, it may be regarded, generally, that health conditions for individuals of all ages are equally favorable.

The figures as given in this article, were released by the American Child Health Association of New York City, which issues a statistical report of infant mortality annually. The 1934 report referred to covered 985 cities of the United States.

The urban infant mortality rate for 1934 represents an interruption in the almost constant downward trend in infant mortality throughout the municipalities of the United States. The 1933 rate was exactly one point lower than the 1934 rate. It would appear that in those cities where increased rates are found in 1934, lower rates have prevailed during preceding years. The American Child Health Association comments as follows: "Public health should not slacken its efforts once a low rate has been achieved. Constant vigilance is essential if the low rate rate is to be maintained."—*Weekly Bulletin, California Department of Public Health.*

WILSHIRE MEDICAL BUILDING IN LOS ANGELES

Erected on Property Owned by the Los Angeles County Medical Association

Under the captions, "Plans Completed for Lofty New Structure" and "Thirteen-Story Project and Large Parking-Space Building Slated for Construction," the Los Angeles *Times* of December 8 printed the following article. The relation of this office building to the Los Angeles County Medical Association is commented upon in this issue (page 4). The newspaper item follows:

Powerfully evidencing Los Angeles' recent greatly increasing construction activity and the general improvement in the Southland real estate situation, a new height-limit structure is to be built here—in the form of an addition to the $1,000,000, thirteen-story, height-limit Wilshire Medical Building, situated at the southeast corner of Wilshire Boulevard and Westlake Avenue. The addition, to rise at the south end of the present building's Westlake Avenue frontage, will make the parent structure about one-third larger than it now is. And its size and importance will make the addition the equivalent of many an individual structure of major magnitude.

Together with a large two-story parking structure to be constructed in conjunction with this addition, this construction program will represent a new investment of around $500,000 by the Los Angeles County Medical Holding Corporation, builder and owner of the present building. The addition itself is estimated to cost in the neighborhood of $350,000. The parent building was built in 1928.

The plans call for a Westlake Avenue frontage of about fifty-eight feet, four inches, which will give the entire structure a frontage of slightly more than 125 feet on the avenue. The building's Wilshire Boulevard frontage is 150 feet. The new wing's equipment will include preparation for future air-conditioning installation.

Ground for the addition will he broken early next spring.

A significant fact pointed out by the manager of the building, is that the complete occupancy of the present structure and the demand for space there prompted the new project. A considerable amount of space in the planned addition already has been engaged.

The new construction materially will further the magnitude and importance of that immediate locality as one of the West's most extensive medical centers. On the northwest corner of Wilshire Boulevard and Westlake Avenue stands the eight-story Westlake Professional Building. At the southeast corner of the same boulevard and avenue, and directly opposite the Wilshire Medical Building, is the library and auditorium building of the Los Angeles County Medical Association.

The Belt Medical Building recently was completed at the northeast corner of the boulevard and Bonnie Brae Street.

Contract has been awarded for construction of a medical office building on a site on the east side of Westlake Avenue, between Wilshire Boulevard and Seventh Street, for Dr. George Piness. The project represents an investment of more than $20,000.

Plans for other large construction of medical-center character is contemplated for the area in which these buildings' sites are situated.

BELT MEDICAL BUILDING
MEDICAL BUILDING

Fig. 1.—Showing location of Headquarters Building of the Los Angeles County Medical Association at 1925 Wilshire Boulevard and its relation to other buildings in this new medical center.

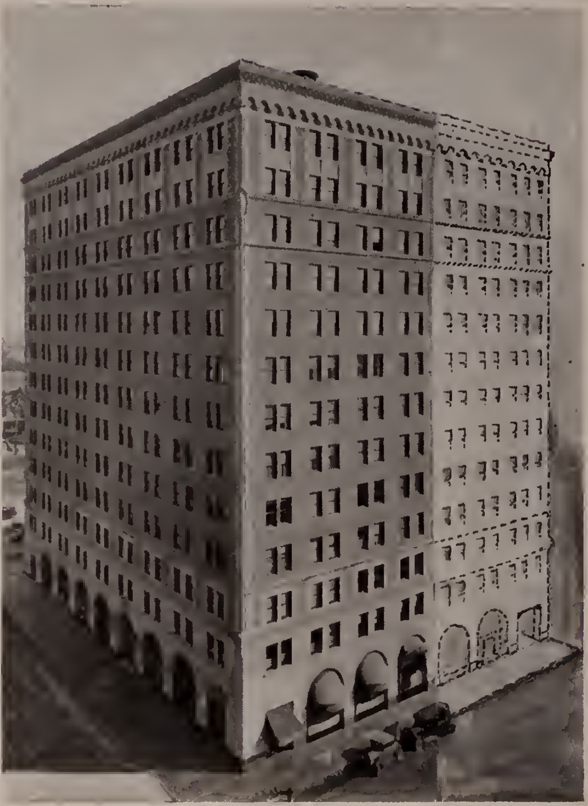

Fig. 2.—Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles. (Proposed addition, fronting on Westlake Avenue, is in lighter detail.)

The parking building, to be constructed by the owning corporation of the Wilshire Medical Building, not only will afford ample free parking space for patrons of that building, but also will be a unique and attractive architectural development in that locality. Work on it will be started within two weeks. It will occupy a site on the west side of Bonnie Brae and about 100 feet south of Wilshire Boulevard. Its street frontage will be 100 feet and its westerly depth 150 feet.

Because of the ground slope there, its roof on the Bonnie Brae side will be level with the street and, while the roof will afford parking facilities, it will be so ornamented as to present a landscaped appearance. The west two-story side of this structure will front on the lane there and the area between it, and access to the medical building will be entirely paved. An ornamental doorway will open from the medical building to this area.

MICHIGAN STATE MEDICAL SOCIETY'S REPORT ON "A. M. A. SPANKINGS"

The *Journal of the Michigan State Medical Society* (on page 709 of the November, 1935, issue) printed the "Report of the Delegates to the American Medical Association" (June, 1935, Atlantic City session).

The August issue of California and Western Medicine (page 105) gave expression to California's reaction on certain events which took place in Atlantic City. Wherefore, the point of view of the delegates from Michigan may be of sufficient interest to be incorporated into the record (referring in that connection, particularly, to those official representatives of the American Medical Association who, directly or indirectly, inspired or permitted the "spanking" news items to be distributed by the national press associations).

Excerpts from the Michigan report follow:

Report of Delegates to the American Medical Association

Because of no previous opportunity to report on the special session, your delegates present herewith a combined report of the special meeting of the House of Delegates of the American Medical Association and the regular meeting held at Atlantic City in June. . . .

The Atlantic City Session

The 1935 Atlantic City session of the American Medical Association House of Delegates held June 11 to 15 was somewhat apathetic as compared with previous sessions in recent years. This was perhaps due to the fact that the action taken at Chicago had deprived the membership of much argument and debate on a subject of vital interest to all.

A curtain of gloom somewhat overshadowed the otherwise peppy atmosphere of the opening session of the House by the announcement that Speaker Warnshuis had unexpectedly suffered the loss of his oldest son. This necessitated his absence until the second session on Tuesday morning.

Despite the apathetic atmosphere there were, however, some interesting things presented of interest to the entire profession. . . .

An interesting sidelight to an otherwise apathetic house was the query by the "stand pat" Republicans of Massachusetts through their good-natured bewhiskered delegate, Dr. C. E. Mongan, who requested that the representatives of the California State Medical Association explain its action relative to health insurance. Doctor Kelly, chairman of the Council of the California State Medical Association, gave a very able and clear explanation. It appeared from his talk that the action of the California State Medical Association was a political expedient, necessitated by the situation that exists in California. His explanation was apparently well received by the House, but subsequent transactions made it appear that California was spanked for its actions. Doctor Kelly's explanation was not published in the transactions of the executive session, but copy and a complete explanation of California's actions have been prepared by the California State Medical Association in the form of a reprint and can be had upon request by addressing Secretary Warnshuis at San Francisco.

Dr. G. R. Leland, Director of Bureau of Medical Economics, presented a special report which was referred to the Reference Committee on Medical Economics without reading. Copies of this report were distributed to the membership and contain recommendations to state and county societies on sickness insurance. It was recommended as a final action of the House that counties, attempting to develop plans, do so with the utmost care and study and that plans be submitted to their respective state organizations for approval before instigation.

The election of officers presented on the surface no excitement, yet one of the most significant changes in more than a decade occurred when Michigan's former secretary, Dr. F. C. Warnshuis, was defeated for the office of speaker by Dr. Nathan B. Van Etten of New York by a vote of 80 to 71. Doctor Van Etten, like his predecessor, is a cultured gentleman of Dutch descent, was vice-speaker for three years and upon various occasions has evidenced able qualifications for this important post.

From the figures you will note that the victory was not so overwhelming, Doctor Van Etten being the victor by but nine votes. It was generally conceded that Doctor Warnshuis' defeat was not due to inability or impartiality, but rather to political expediency. It has been suggested that because of California's action on sickness insurance he might have been reëlected had he remained in Michigan. Yet this argument is quite out of harmony with other events during the election of officers. You are aware that Michigan had a candidate for member of the Board of Trustees in the person of Carl F. Moll, than whom no finer man could be found in any state to grace the dignified table of the Board of Trustees. His fairness, ability, and adherence to the sound principles of organized medicine stamp him as timber without a flaw. Although Doctor Moll was not elected to the Board, Doctor Moll in person was not defeated. Apparently he was, as has been suggested in our Journal editorially, simply the goat for an undeserved but effective chastisement to Michigan for its action in presenting certain resolutions at the Cleveland meeting in 1934. Although we were disappointed in defeat we hold no ill will toward the House membership, being convinced that misunderstanding and incorrect opinions will some day be replaced by confidence and consequent vindication. . . .

"AND/OR"*†

Most intelligent laymen regard the jargon of lawyers as an obvious trade trick, a professional pig-Latin calculated to obscure otherwise simple matters and impress clients with the indispensability of their services. Fortunately, most of their pompous verbal mumbo-jumbo is harmless tautology. But at least one legal usage—"and/or"—is dangerous nonsense.

Many a suit at law has hinged on the interpretation of an "and/or." Usually the decision has gone against the drafter who slipped that literary what-not into his contract. An early instance is a case decided in a British court on February 8, 1855. A shipper named Cumming had accepted from a shipowner named Cuthbert a contract to provide one complete cargo of "sugar, molasses and/or other lawful products." After Shipper Cumming had loaded on every puncheon of sugar and molasses the ship would hold, some odd space remained. He left it empty. Owner Cuthbert claimed he should have filled it with "other lawful products," brought suit for £139, 8*s*., 3 *d*. damages. The trial judge ruled that the ambiguous "and/or" in Owner Cuthbert's contract had rightfully entitled Shipper Cumming to do as he pleased about odd space.

Last winter Virginia's Carter Glass, as chairman of the Senate Appropriations Committee, found the Relief bill shot through with such befuddling phrases as "The President is authorized . . . to make grants and/or loans and/or contracts." Flying into a fine rage, the peppery little Virginian marched out on the Senate floor, successfully defended his action in striking out "the idiotic expression 'and/or'" wherever it appeared in the bill. To his support Senator Glass summoned an impressive battery of opinion against "and/or."

"It is a bastard," said Lawyer John W. Davis, "sired by Indolence (he by Ignorance) out of Dubiety. Against such let all honest men protest."

"I am delighted," wrote one-time Attorney-General G. W. Wickersham, "that you have taken up the removal of this inaccurate monstrosity of expression from laws passed by the Congress of the United States."

"The expression 'and/or' is a split personality, a grammatical psychopath," declared a Baltimore *Sun* editorial entitled "Grand 'And/Or' Old Carter." "If Senator Carter Glass can succeed in removing it at least from our federal legislation, he will deserve the thanks of a confused and/or harassed populace."

Last week lovers of verbal clarity placed the eldest of the Wisconsin Supreme Court's seven justices on a pedestal beside Senator Glass. Up for decision had been a complex case involving an insurance company which insured "C. D. Brower, Jr., and/or the Sturgeon Bay Company," against liability for accidents except "to any employee of the assured. . . ." Brower was a trucker who had contracted to do a job for Sturgeon. When a Sturgeon employee was injured in a collision with a Brower employee the insurance company tried to wiggle out of paying Brower's damages by arguing that the policy ran jointly and its "and/or" had really meant simple "and."

The decision was written by Justice Chester Almeron Fowler, a handsome, upstanding, straight-thinking gentleman who golfs, fishes, camps, walks two and one-half miles to his office every day and will probably celebrate his seventy-third birthday this week by a brisk game of curling. Famed for his verbal vigor, old Justice Fowler growled in his insurance case decision:

"It is manifest that we are confronted with the task of first construing 'and/or,' that befuddling, nameless thing, that Janus-faced verbal monstrosity, neither word nor phrase, the child of a brain of someone too lazy or too dull to express his precise meaning, or too dull to know what he did mean, nor commonly used by lawyers in drafting legal documents, through carelessness or ignorance or as a cunning device to concel rather than express meaning with view to furthering the interest of their clients. We have ever observed the 'thing' in statutes, in the opinions of courts, and in statements in briefs of counsel, some learned and some not."

Ruling flatly against the insurance company, Justice Fowler declared: "If the construction given [by the Court] differs from the meaning actually entertained and intended to be conveyed by the company when it issued its policy, the company has only itself . . . to blame, and it is justly penalized for attempting to express—or perhaps to conceal—the meaning intended by the use of a mere mark on paper."

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. IX, No. 1, January, 1911

From Some Editorial Notes:

The New Year.—A new year and a new volume of the *Journal*; three hundred and sixty-five blank days with their unknown happenings-to-be and about as many blank pages to contain unknown chroniclings of as yet unhappened things. How stale and flat life would be if one knew a year ahead just what was going to happen; to awake every morning with a knowledge of every incident of the day ahead! Why, it would almost be enough to make one fool the fates and quit!

* * *

Just Lies.—It is difficult to imagine anyone with sense enough in his head to be the manager or editor of a magazine of any sort, kind or description, really believing that there never was a case of plague in California and that the whole "plague scare" was merely a deep-laid plot of the Marine Hospital Service. Of course it is *possible* that some such idiot may be alive and may be running a magazine and may really believe that tommyrot; "all things are possible, but some of them are darn scarce." When the *Twentieth Century Magazine* publishes that sort of article and sends slips broadcast over the country calling attention to it, it is a good deal easier to believe that the magazine has been "influenced" to publish the article and that someone has paid for it and paid for advertising it. The slip in question says that "the writer shows up the reasons for declaring San Francisco an infected port, and says that no alleged case of bubonic plague in San Francisco was ever diagnosed as such by the attending physician, while the victim was alive or after death." That is just a plain lie. . . .

* * *

Division of Fees. — A committee of the Los Angeles County Association has prepared some resolutions on the subject of the division of fees between physician and surgeon, without the knowledge or consent of the patient, that are most timely; they will be found in full on another page of the *Journal*. . . .

* * *

Medical Expert Testimony.—It is hoped the profession will give their earnest support to this bill, which will be presented at Sacramento this winter. California should take pride in the effort to be the first state in the Union to accomplish a radical reform in respect to medical expert testimony. The bill as it will be presented will have the unanimous endorsement of committees from the Los Angeles and San Francisco County Medical Societies and Bar Associations, and probably from the State Bar Association. . . .

* * *

Venereal Diseases.—Under date of October 1, the State Board of Health sends out a notice to the effect that beginning January 1, 1911, syphilis and gonorrhea shall be reportable to the health authorities as infectious diseases. It will be a very difficult thing to enforce this rule and the board has wisely decided that cases may be reported by office numbers and not by the names of the patients. . . .

* * *

Scientific Program.—The Committee on Scientific Program for the State meeting at Santa Barbara is arranging a program which it trusts will meet with the cordial approval and support of the profession of the entire State. It has seemed to the committee that a fewer number of

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

News

"Guarantees to insurance policyholders of medical and dental services by the company's staff constitute unlawful practice, it was ruled by the State District Court of Appeal yesterday in the case of the *Pacific Employers' Insurance Company* vs. *Samuel L. Carpenter, Jr., State Insurance Commissioner.* E. Forrest Mitchell, Carpenter's predecessor, refused approval of such insurance policies in 1934. The San Francisco County Superior Court issued a writ of mandate compelling the insurance commissioner to approve the policies. Yesterday's decision reversed the Superior Court judgment on the ground that it is unlawful for a 'middleman' to make profit from learned professional services. Insurance companies which merely promise to pay the policyholder's expenses in the event of illness are not affected by the ruling, it was said." (San Francisco *Examiner*, December 13, 1935.)

"Inventor Fred W. Reed must cease shining his health-ray machine on people, and Naturopaths Arthur O. Borland, Ray Borland, and Jack Borland, all of Hawthorne, must cease naturopathing. Federal Judge Leon R. Yankwich today had dismissed their petitions seeking injunctions to restrain the State Board of Medical Examiners from interfering with their business." (Los Angeles *Post-Recorder*, December 10, 1935.) (Previous entry, December, 1928; May and December, 1935.)

"Dr. St. Louis Estes, nationally known lecturer, unexpectedly pleaded guilty today to two counts of a four-count federal indictment charging him with misuse of the mails. Estes' plea was entered after his case was set for trial before Federal Judge William P. James. The court referred the case to the probation officer, and set January 20 for sentence. The plea was entered after attorneys for the lecturer had conferred with United States Attorney Peirson M. Hall, who agreed to dismiss two of the counts to save the Government the expense of a trial. By the compromise, a charge against Estes' wife was dismissed. In the indictment, Doctor Estes was charged with having defrauded persons throughout the country by taking subscriptions for a book, 'How to Live 150 Years.' The book never was published." (Los Angeles *Post-Recorder*, December 10, 1935.)

"Immediately after final arguments had been concluded in the trial of Dr. H. N. Tatem on a charge of practicing medicine without a license, the chiropractor was placed on trial in Municipal Judge Leo Aggler's court yesterday on a second charge of violating the Chiropractic Practice Act. Judge Aggler continued the instruction of the jury in the first case until this morning, and also will instruct the second jury at that time. Principal witnesses against Doctor Tatem were Mr. and Mrs. Walter Taylor, who, with Jerry Bellevue, are facing trial in Superior Court on charges of attempting to extort $1,400 from Doctor Tatem by making him pose at gunpoint in his underwear while photographs were taken. The Taylors testified in the present trial that Doctor Tatem performed an illegal operation upon Mrs. Taylor." (Los Angeles *Illustrated Daily News*, December 11, 1935.)

"E. B. Hartman, San Bernardino chiropractor, whose conviction on charges of violating the State Medical Prac-

VACOLITER
VACOLITER 1136
6% ACACIA

6% Acacia Solution

A Substitute for Blood Transfusion in the Treatment of Acute Hemorrhage or Shock.

in the VACOLITER

Administered as Readily and Simply as Intravenous Dextrose.

- In restoring and sustaining dangerously depleted blood volume, Baxter's Acacia Solutions offer proved therapeutic value with . . . instant availability . . . compatibility with all blood groups . . . freedom from harmful reactions . . . simplicity of administration . . . economy.

- The literature on intravenous acacia stresses the necessity for proper preparation of the solution. Baxter's Acacia is carefully prepared with the established Vacoliter technique and sterilized in the sealed Vacoliter. Before release to the profession, each lot must satisfy the exacting requirements of the chemical, bacteriological, and biological tests applied to every Vacoliter solution—your final assurance of complete safety.

6% Acacia in Physiological Sodium Chloride Solution, Plain or with 5%, 10%, or 20% Dextrose, is available in 1000 cc. and 500 cc. Vacoliters. "Acacia Intravenously" with bibliography sent at your request.

"Gentlemen, it is with pride in our profession that I tell you of my difficulty in getting clinical material to illustrate our discussion of rickets today. Twenty years ago . . . "

THE above picture was suggested by a situation arising at a recent medical meeting attended by thousands of physicians. Their comments revealed a country-wide decrease in the incidence and severity of rickets, the result of clinical application of modern developments in the science of nutrition.

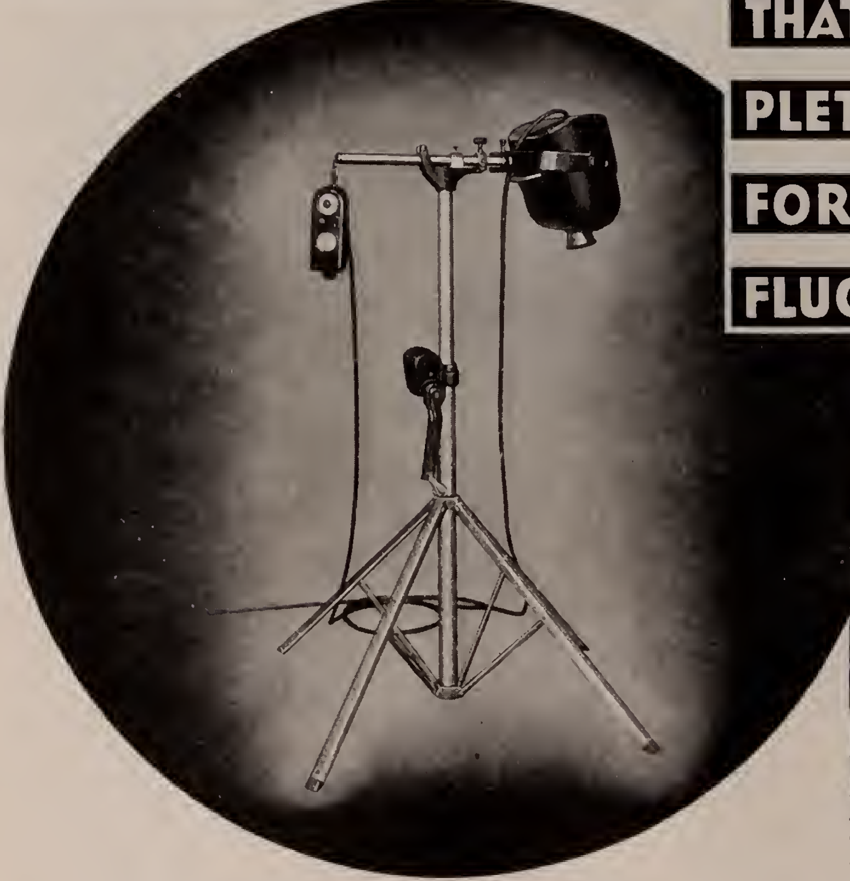
Three minims of Haliver Oil with Viosterol, in a tasteless gelatin capsule, or delivered from a dropper, provide at least as much vitamin A and vitamin D as four teaspoonfuls of Cod-Liver Oil (minimum standards U. S. P. X revised 1934).

Parke-Davis Haliver Oil with Viosterol has a vitamin A activity of not less than 50,000 U. S. P. (1934 Revision) units per gram; and vitamin D activity of not less than 10,000 U. S. P. (1934 Revision) units per gram.

Parke-Davis Haliver Oil with Viosterol is available in 5-cc. and 50-cc. amber bottles with dropper, and in boxes of 25, 100, and 250 three-minim gelatin capsules.

PARKE, DAVIS & COMPANY • *Detroit, Michigan*

Now... A PORTABLE X-RAY UNIT THAT PROVIDES COMPLETE ANGULATION FOR RADIOGRAPHIC & FLUOROSCOPIC WORK



Packed in its two zipper-type, featherweight cases, the entire Keleket Portable takes up no more room than your golfing equipment.

FACILITY in every day use is a most vital factor in Portable equipment. That is why all requirements for complete angulation, positioning, carrying, and safety have been stressed in the design of the Keleket Shock-proof Portable.

Such facilities as stereoscopic shifting mechanism, and other features usually found only on the most elaborate diagnostic equipment, are included in its design. Entirely exclusive to Keleket is the compact elevating device which provides flawless up and down movement. The collapsible tube stand folds quickly and easily for carrying.

The Keleket Shock-proof Portable stands supreme as a brilliant example of traditional Keleket ruggedness, simplicity, and capacity. Write for complete catalog and demonstration.

HOLDING THE MIRROR UP TO NATURE

"To hold, as 'twere, the mirror up to Nature"
—Hamlet, Act III, Sc. 2

Because physicians agree that Nature's breast milk is ideal, S. M. A. is made to resemble breast milk in many* ways. We have undertaken "to hold, as 'twere, the mirror up to Nature," by making S. M. A. as similar to breast milk as possible.

When diluted according to directions, S.M.A. resembles breast milk not only in percentages of carbohydrate, protein, fat and total salts (ash) content, but also in the chemical and physical constants of the fat, in the kind of carbohydrate present, and in the correlation of the constituents.

This similarity makes it easy to start the infant on supplementary feedings of S. M. A., gradually shifting over to complete feedings of S.M.A. The physician finds S.M.A. simple to prescribe and the mother gratefully finds it simple to prepare. The antirachitic factor is included and there is no extra Vitamin D to buy.

Moreover, the liberal provision of Vitamin A activity is constant and uniform in S.M.A. throughout all seasons of the year, whereas this factor is variable in cows' milk, fresh or evaporated.

Samples and literature available to physicians on request.

* S.M.A. is a food for infants—derived from tuberculin tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is *essentially similar to human milk* in percentages of protein, fat, carbohydrates and ash, in chemical constants of the fat and in physical properties.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 34)

appeared several days ago at her home at 348 Union Street to inquire if anything was wrong. Mrs. Munoz replied she had plenty of aches and pains. 'Doctor Karolina' informed Mrs. Munoz that hiding money would cure her. He returned yesterday with a large bowl of sand. Mrs. Munoz dug up $60 in currency and hid the bills carefully in the sand while 'Doctor Karolina' acted as official observer. He noted she was wearing a valuable watch, and suggested that be hidden also. Then 'Doctor Karolina' patted the sand down carefully and departed. He said he would return in an hour, by which time all the aches and pains would have vanished. Several hours later the aches and pains were still there, but 'Doctor Karolina' was not. Mrs. Munoz investigated the bowl of sand and discovered the money and the watch were not there." (San Francisco *Examiner* (East Bay Section), November 26, 1935.)

Investigation reports relate that an individual signing checks "R. J. Burke, M. D.," which were found by merchants to be "N. G.," recently pleaded guilty in the court of San Francisco Municipal Judge Alden Ames, who imposed a sentence of ninety days, suspended on condition that he return to the various persons in San Francisco the money of which he had defrauded them, and that he also discontinue representations that he is a physician. In a statement to our investigator, Burke related that his only professional training was a short course in the so-called "American College" at Chicago, which institution is said to conduct a correspondence course in physiotherapy, electrotherapy, physical culture, etc.

This is moral perfection: to live each day as though it were the last; to be tranquil, sincere, yet not indifferent to one's fate.—Marcus Aurelius.

The Value of Laboratory Tests for Water.—This article is designed to aid those who for various reasons suspect the safety of their water supply.

It is not generally understood how little useful information may result from a single test made without any knowledge regarding the source of the sample, the nature of the surroundings, the cleanliness of the container, the temperature condition and elapsed time in transit, the method of taking the sample, etc.

A careful reading of the following may clear up in many minds the doubts regarding a given water supply without recourse to a laboratory test. Such tests are not made routinely by the State Laboratory for reasons that will also be clear on further reading of this discussion.

Water may be undesirable for drinking purposes because of turbidity or because of unpalatable tastes from the presence of decaying vegetable matter in the case of a spring, or of salts in the case of a well water. Such things are not matters of health, but of taste, and they are not settled by laboratory tests.

Water may be really unsafe from very few causes. These causes are the presence of disease producing bacteria or of harmful mineral ingredients. The latter can be ruled out at once for the reason that in all the years of our experience we have never encountered in California a natural water that would be harmful by reason of mineral content, excepting in certain desert localities.

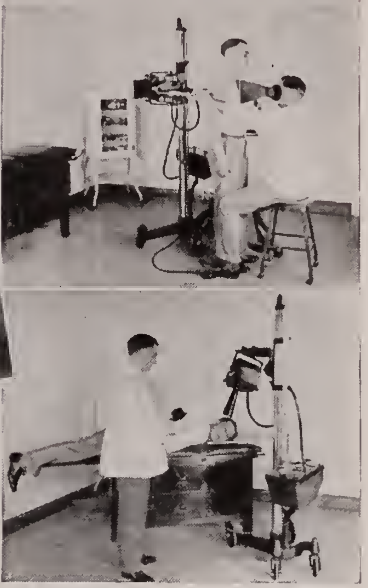
The species of bacteria capable of producing disease are few in number. When present they come from some previous human case of the disease and are never present in water except when freshly polluted with human sewage. Typhoid and dysentery are the only diseases that in this country may be contracted from water. The bacteria causing typhoid and dysentery cannot be detected in water even when present by laboratory methods. We can only, by finding of evidence

(Continued on Page 41)

WHAT OIL-IMMERSED X-RAY APPARATUS HAS CONTRIBUTED TO OFFICE PRACTICE

Model "D" Mobile — compact, conserves floor space, and can be operated in any part of the building by plugging in to the nearest electric service outlet.

Model "DRF" in which the "D" unit is incorporated in a combination radiographic-fluoroscopic table.



Fluoroscopic and radiographic applications of the Mobile "D", showing how the office examination couch can be utilized to advantage.

● The principle of G-E shock proof x-ray apparatus differs radically from all other principles ever applied to x-ray design, in that the entire high voltage system, including the x-ray tube itself, is immersed in oil.

So successful has this type of apparatus proved itself over a period of twelve years, that today finds the same principle applied to G-E x-ray apparatus of capacities as high as 300,000 volts. It has made operation of diagnostic x-ray equipment 100% electrically safe, unaffected by atmospheric conditions, comparatively simple to operate, and convenient to apply. Thus a physician may consider the use of such a diagnostic x-ray unit in his office as thoroughly practicable.

The "D" Series of G-E shock proof x-ray units is popular not only among general practitioners but also in some of the specialty practices, where the range of diagnostic service here provided finds wide adaptability. For example, a radiograph of the average size pelvis is obtained with a one-second exposure, using the Potter-Bucky diaphragm at 30-inch distance; exposure values of other parts of the body as short as ⅛ second. The quality of the resulting radiographs leaves nothing to be desired.

If you have been foregoing the advantages of x-ray diagnosis in your practice in the belief that it involves electrical hazards and other complications in application, the possibilities offered you in the G-E Model "D" series will prove a revelation. We'll be glad to send you descriptive literature without obligation—on receipt of the coupon below:

You may send me your catalog on the G-E Model "D" Series Diagnostic X-Ray Units, provided no obligation is implied. A5

Pneumonia Typing is Simple!

DIAGNOSIS—pneumonia! Pneumococcus pneumonia? Is serum therapy indicated? That depends on the type of the causative pneumococcus.

The physician calls for Rapid Typing sera *Lederle,* Types I and II, the types for which "Council-Accepted" therapeutic sera are available. Microscopic examination of a fleck of the patient's sputum mixed with the required amount of specific typing sera, reveals typical changes in the capsule—Neufeld reaction—in the mixture that identifies the type. These changes consist of a swelling of the capsule with a sharp definition of outline.

All in a few minutes! And therapeutic serum administration may be begun at once. Pictures of the significant capsular swelling are in the direction sheets in the *Lederle* packages. (If no such capsules are found, the efforts to identify the type can be carried further. *Lederle* has Typing sera for 29 types of pneumonia but full use of the series is usually regarded as requiring special technical training.)

Early administration is essential to secure the radical reductions of average mortality obtainable with serum therapy.

(Continued from Page 38)

of sewage pollution, say that if cases of these diseases exist in the vicinity, the water may carry the germs. The laboratory test, therefore, shows only sewage pollution and not specific disease germs.

Since we cannot distinguish between pollution of human and of animal origin, and since contamination from animal sources is not capable of producing disease, an investigation of the source of the water with respect to the possibilities of human contamination is usually more important than the laboratory test. It is for this reason that the State Laboratory discourages the sending in of samples of water from private sources.

Anyone who thinks he has reason to suspect the safety of a well or spring should make an investigation of the surroundings. If there is no privy or cesspool within seventy-five feet of a well, pollution is practically impossible and no laboratory test is needed to establish the safety of the water. If drainage from animals can reach the water, the matter is for aesthetic consideration only. Disease cannot result. The same may be said for dead animals in waters. It is not an appetizing thought to have one's drinking water so polluted, but disease is not caused thereby. A well on a farm even with a privy within ten feet can be polluted only by the individuals living on the farm. Therefore, if a case of typhoid fever appears on a farm, it is manifest that the well is not to blame, for the reason that the well cannot be contaminated with typhoid until either a typhoid case or a carrier appears in the immediate vicinity. The first case of typhoid in the family must, therefore, have received the infection from some other source.

In conclusion, then, when the water is under suspicion, proceed as follows:

If the source is a public water supply, consult your local health officer.

If the source is a spring or a well removed a safe distance from the possibility of human contamination, dismiss the matter from your mind.

If the source is a well on your premises, look to the location of the well with respect to privies, cesspools, and barns. If too close, move one or the other. Protect a well from surface drainage.

If the source is a well and is possibly subject to sewage contamination from various sources outside the family, write a letter to the Bureau of Laboratories, California State Department of Public Health, Berkeley, giving full information regarding surroundings and reasons for suspecting the water. As a last resort, and in particular cases, a special mailing container for samples will be sent.

Federal Food and Drug Administration. — Recent seizures are reported as follows: substandard canned foods not labeled in the prescribed manner, one lot of peaches, two of peas, and three of tomatoes; honey adulterated with invert sugar and also short weight, 430 shipping cases; 1,800 packages of short-weight wafers, "Melba" toast, toast-crumbs, and whole-wheat toast shipped by a manufacturer in New York; one lot of slack-filled canned spinach bearing no net-weight statement on the label; five assorted jams and jellies (fifty cases in all) deficient in fruit and containing added pectin; 750 packages of a shortening put out by a Los Angeles concern which labeled the article so as to imply it was made of vegetable oils, when in fact it contained fish oil; 13,000 packages of a jelly powder not labeled to show its imitation character; one lot of canned soaked dry peas carrying on the label a design of fresh green peas; 600 cases of beer containing materially less alcohol than the label claimed; seventy-four bottles of California wine masquerading as an imported article; 650 cases of whisky labeled "U. S. P.,"

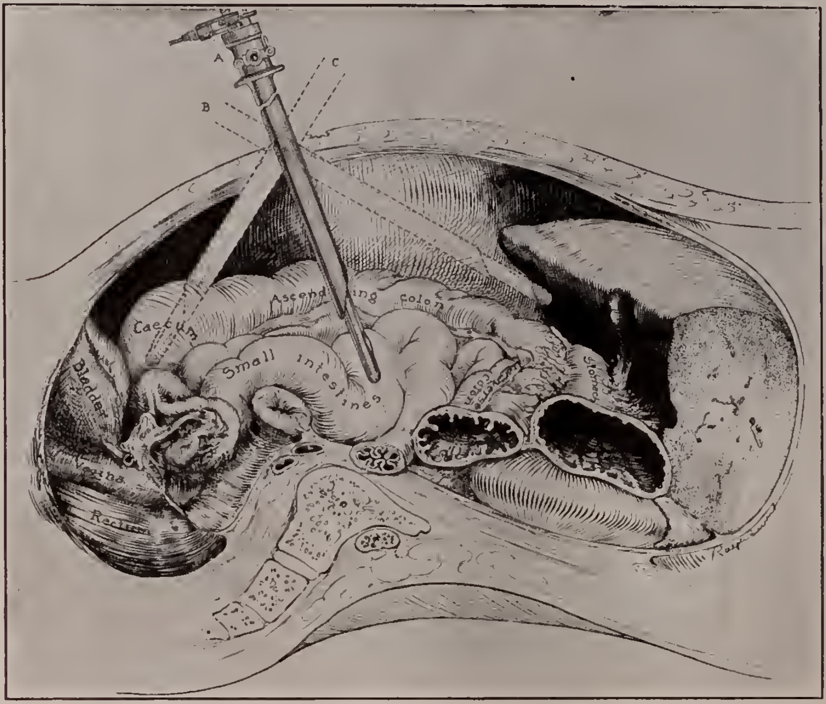
THE RUDDOCK PERITONEOSCOPE and THE PATIENT



Method of visualizing abdominal cavity after distention with air, showing the scope of visualization.

Have you a patient whose clinical diagnosis is tuberculous peritonitis, malignancy, or cirrhosis of the liver? Has this patient been told his condition is inoperable? If *you* were the patient, would you want a last positive proof of the clinical diagnosis?

This proof can be supplied by the RUDDOCK PERITONEOSCOPE. The organs are sharply visible, thus permitting eye-control in diagnosis without an exploratory operation. The recovery time is approximately 24 hours, without surgical shock.

The RUDDOCK PERITONEOSCOPE does not eliminate laparotomies, but permits diagnosis by eye-control in such cases where major surgery is a grave risk.

but not conforming to the requirements of the United States Pharmacopoeia; one gallon of tincture of aconite below the U. S. P. standard of strength; and an "ephedrin compound nasal ointment" containing only one-third as much ephedrin hydrochlorid as represented, and entirely lacking in benzocain, also claimed on the label.

Patent medicines seized during the same period because of false and fraudulent medicinal claims were: "BP Prescription," composed of potassium iodid, a laxative, plant extractives, alcohol, sugar and water, for ailments arising from impurities of the blood; "Elk Brand White Pine and Tar Compound," a cough syrup containing over 12 per cent alcohol when only 5 per cent was declared on the label, for coughs and bronchitis; "Dr. Graybill's Prescription No. 1313," a cinchophen preparation bearing no notice as to the dangerous nature of cinchophen, for rheumatism, sciatica, neuralgia, lumbago, sore muscles, neuritis, arthritis, gout, and the elimination of acid poisons and uric acid; "Kalis' Laxative Capsules,' consisting of two grains of acetanilid per capsule, with asafetida, a laxative, camphor and magnesium and iron compounds, for grippe and influenza; "Dr. Sumner's Lung Salve," a petrolatum containing eucalyptus oil, for croup, pneumonia, and throat and lung diseases; "Sylvester Brand Haarlem Oil," a mixture of turpentine oil and a sulphonated fatty oil, for purifying the blood, stimulating the stomach, for scurvy, inflammation of the eyes, ulcers, sores, boils and abscesses; "Vegetrate," composed of rice bran, senna, spices, dried green leafy vegetables, kelp (seaweed), calcium carbonate and dried cranberries, and falsely labeled as "made from fresh raw vegetables and fruits," for hyperacidity, diabetes, hay fever, asthma, and hypertension; "Vegi-Lax," a mixture of bran and dried plant materials selling at $2 a pound, each pound to be used in the preparation of two hundred loaves of a so-called "laxative health bread," which extension of laxative effect, the Government alleged, was beyond the capabilities of the article; "Wood's Famous Specific Remedy," consisting of one-third alcohol and the remainder a solution of atropin, strychnin and other plant extracts in water and ammonia, for colic, coughs, colds, distemper, pneumonia, founder, milk fever and other ailments of dogs, cattle, and horses; and three large lots of miscellaneous antiquated salvaged drugs shipped by firms in Indianapolis and Chicago, and carrying claims of benefit in such serious conditions as asthma, influenza, St. Vitus' dance, tuberculosis, rheumatism, whooping-cough, gout, and grippe.

"Bye-Lo" BABY MILK
IS
Evaporated Milk, with Dextrose added.

1. Bye-Lo is an acceptable formula for nursing infants.
2. Bye-Lo is the most economical of all prepared infant foods.
3. The cost of Bye-Lo is less per quart than the average cost of fresh milk.
4. Bye-Lo, being liquid, is easy to accurately reconstruct.
5. Bye-Lo is made from milk from TUBERCULIN-TESTED COWS ONLY.

Firewalking.—A demonstration of firewalking, which is still practiced by natives of India at religious ceremonies, was given at Carshalton (near London) in the presence of members of the University of London Council for Psychical Research and some well-known physicians. The firewalker was a young Indian, Kuda

CALSO WATER

Palatable ALKALINE *Sparkling*

NOT A LAXATIVE

Calso Water: An efficient method of supplying the normal ALKALINE SALTS for counteracting ACIDOSIS.

Calso Water: Made of distilled water and the ALKALINE SALTS (C. P.) normally present in the healthy body.

Calso Water: Counteracts and prevents ACIDOSIS, maintains the ALKALINE RESERVE.

WITH EIGHT STORY GARAGE

Bux, a Kashmiri Mohammedan, thirty years of age, and weighing 8½ stone (54 kilograms). He said that he first practiced firewalking at the age of fourteen and that the fire did not harm him because of his faith. The fire was contained in two trenches 12 feet long, 6 feet wide, and 8 inches deep. The materials used in preparing the fire included seven tons of oak logs, a ton of firewood, a load of forest-burnt charcoal, and ten gallons of paraffin. When the demonstration was given, the fire trenches had been burning for eight hours, and the charcoal, which had been placed on the top, was fanned by a high wind to an intense heat, which was measured by a thermometer and found to be 800 F. on the surface. Bare-footed, Kuda Bux walked twice along these fire trenches, his feet making contact with the burning embers for some five seconds each time. After both walks his feet were examined by Professor Pannet, director of the surgical unit at St. Mary's Hospital, who found no scorching or other trace of injury. Under the arch of the right foot he previously placed a piece of courtplaster, which was not even scorched. The temperature of the feet immediately after passing over the fire was found to be the same as before starting. Kuda Bux declared that he was not conscious of the heat as he walked over the fire, although he appeared to be as susceptible to the heat as other persons when standing near it. Professor Pannet said that there was no unusual toughness or thickening of the soles of the feet. Kuda Bux was invited to do the firewalk a third time, the full length of both trenches, but he asked to be excused. He appeared to be disturbed by the scientific tests and apparatus and the critical curiosity of the audience. His explanation was that "the faith" had gone out of him. Attempts to firewalk were then made by two young men, but after two steps on the embers they jumped off with their feet blistered. One was the editor of St. Bartholomew's Hospital Journal. A physician present, who had seen the ceremony of firewalking in India, said that the test was made under unusually severe conditions, which would have deterred most firewalkers. The trench was shallower than was customary and, with the high wind increasing combustion and blowing away the ash, the heat was more intense and transmitted without any insulation. Though Kuda Bux boldly did the walk twice, he eventually seemed to realize that the conditions were too severe for him to do the firewalking properly. There was no question of any fake about what he did do. The circumstance of the performance rendered this impossible. But it is unsatisfactory that we are left with no explanation of the phenomenon within the sphere of physics or of physiology. Only that of "faith," given by Kuda Bux himself, is forthcoming. Perhaps something on the subject will be published by Professor Pannet or by other medical witnesses present.—*Journal of the American Medical Association.*

Ten Health Commandments

1. Help yourself to health. Form habits that will fight for you, not against you.
2. Do not expect to have good health without effort. Health must be earned.
3. Adopt the policy that an ounce of prevention is worth a pound of cure.
4. Make food your servant, not your master. Eat for strength.
5. Breathe deeply, for air is life's first requisite and nature's best tonic.
6. Exercise for health, not for strength. Exercise sends clean blood to the brain.
7. Seek sunshine, for sunshine and disease are always enemies.
8. Water—use plentifully daily; warm for cleanliness, cold for tonic.
9. Keep a clear conscience, for true rest is mental as well as physical.
10. Work planfully, read much, and play often. Play keeps old age at bay.

Paralysis Fund to University School.—The Hooper Foundation of the University of California has received $5,000 from the committee in charge of distribution of the funds from President Roosevelt's Birthday Balls, for the purpose of continuing studies in the cause and treatment of infantile paralysis.

The work, which is general in its nature, is being carried on under the direction of Miss B. F. Howitt, associate in research medicine.

Distribution of the fund this year was made to a number of schools, colleges and other institutions engaged in infantile paralysis research and treatment. The University's interest in this work centers around a pool in the University Hospital in San Francisco, fashioned after the famous Warm Springs pool in Georgia, and in research and treatment work in other departments of the University Medical School.

"If we take the number of babies conceived in the womb of the women of this nation (Great Britain) who might be born, we have 938,000. The number that succeeds in getting born is about 800,000. This is not a good beginning. It means that 138,000 have not sufficient vitality to get themselves born; it also means that the mothers were not properly fed and properly instructed. Of the 800,000 who do manage to enter the world, 100,000 die before they are one year old. This means dirty milk or no milk at all—ignorance, bad food, or poor living conditions. We drop 100,000 before the age of fifteen, just before they are becoming industrial producers and available for military service, and of the remainder who do grow up, we find that another 100,000 have to be rejected for military service because they are unfit. That is 57 per cent destroyed in peace."—George Bernard Shaw.

Do not spend your days waiting for an angel to deliver realized hopes at your door. Go out and toil for them. There are few forms of hard work more wearying than waiting.

Left Handed Resolutions

—are seldom kept

RESOLUTIONS made with the left hand upraised, or the fingers crossed, had better never be made. But, making resolutions and keeping them sometimes requires more than the will to do.

Take milk drinking, by adults, for instance. Many a person will agree with you perfectly that they should drink milk regular every day. But, many such a resolution fails because of a belief that all milk tastes alike, and "I don't like milk" becomes a real objection.

When one of your wavering "resolvers" objects to milk, why not suggest Golden State Milk? They will find surprisingly fine flavor in Golden State. A flavor that is not there by accident, but because Golden State researches have disclosed the way, through scientific feeding and handling, to maintain a uniform, sweet, refreshing flavor in every bottle of Golden State Milk.

Remember, too, in prescribing Golden State Milk, that it is truly a "balanced" milk. Rich in cream, of course, but rich below the cream line, too!

Colfax School for the Tuberculous

Colfax, California

(Altitude 2400 feet)

This institution is for the treatment of medical tuberculosis and of selected cases of extrapulmonary (so-called surgical) tuberculosis.

The Colfax School for the Tuberculous consists of five Hospital Units with beds for patients who come unattended and a Housekeeping Cottage Colony for patients and their families.

The Colfax School for the Tuberculous offers the following advantages:

1. Patients are given individual care by experienced tuberculosis specialists. The patient is treated according to his individual needs.

2. Patients are taught how to secure an arrest of their disease, how to remain well when once the disease is arrested, and how to prevent the spread of the disease.

3. Patients have the advantage of modern laboratory aids to diagnosis and of all modern therapeutic agencies.

4. The climate of Colfax enables the patient to take the cure without discomfort twelve months in the year. We believe climate is secondary to medical supervision and rest, but the fact remains that it is easier to "cure" under good climatic conditions than where these climatic conditions are absent.

5. Colfax is accessible. It is on the main line of the Ogden Route of the Southern Pacific R. R. and has excellent train service. It can be reached by paved highway, being on the Victory Highway, with paved roads all the way to Colfax.

Benzyl Methyl Carbinamine 1% in Liquid Petrolatum with 1/3 of 1% Oil of Lavender.
COUNCIL ACCEPTED
For local application to shrink the nasal mucosa. Use as a spray or apply with a dropper.
Smith, Kline & French Labs.
Philadelphia, Pa.
ESTABLISHED 1841

Effective economy is measured in terms of something more than price alone. The low cost of Benzedrine Solution appeals to the patient, but the physician realizes even greater economies in efficiency.

(1) Giordano has recently shown that "Benzedrine in a 1% oil solution . . . gave a shrinkage which lasted approximately 18% longer than that following applications of a 1% oil solution of ephedrine."
(Penna. State Med. Jour., Oct. 1935.)

(2) And Scarano has said, "The secondary reactions following the use of Benzedrine were less severe and less frequent than those observed with ephedrine."
(Med. Record, Dec. 5, 1934.)

When a liquid vasoconstrictor is indicated, prescribe

Understanding will Gain the Coöperation of Your Diabetic Patients

Over 10,000 physicians bought

A DIABETIC GUIDE

By S. E. Massengill, M. D.

Now in the Third Edition—1935

The special purpose of this Guide is to render assistance to the diabetic through his physician, so that the patient may help to manage his disease by diet and other approved measures that enter into his hourly requirements.

Chapters cover: Diabetes; General Treatment of Diabetes; Treatment of Diabetes by Diet; by Insulin; by Weight Control; by Exercise and Rest; Food Tables; Menu Planning; Diabetic Recipes; Soy Beans; Testing the Urine; and a wealth of other information of vital importance to the diabetic.

"A Diabetic Guide" can be read understandingly by the patient. It gains his coöperation, the most important aid in the successful treatment of diabetes. Size 6x9; 232 pages; bound in maroon art book cloth; regular price, $2.00 per copy; 6 copies for $10.00.

SPECIAL OFFER ON OFFICE COPY–$1.00

We are making a special price of $1.00 for **one copy only.** Orders accompanied by remittance will be shipped postage prepaid from any of the offices of The S. E. Massengill Company. "A Diabetic Guide" represents a dollar well invested.

A System for the
Collection of Fees
that has proved its worth

Our bookkeeper fails to find your account settled on our books. Please help him out.

PAST DUE!

☛ *This Account has no doubt escaped your notice. Will you please favor us with a remittance by return mail and oblige?*

THIS ACCOUNT
IS PAST DUE.
PLEASE REMIT.

Regarding Your Past-Due Account

Our records show that several statements and reminders have been sent you regarding the enclosed statement.

If your circumstances have made it impossible for you to pay the amount due, kindly write us promptly to that effect. Our office will then endeavor to extend all possible courtesies.

You appreciate, we are sure, that physicians, like other citizens, must pay their bills promptly. They can only do so, however, when their own clients in turn pay them promptly for such professional services as may have been rendered.

A check to cover your account, which is now considerably overdue, will be appreciated.

Final Notice

In practically all businesses the custom which is generally followed with overdue accounts is to send such to a collecting agency.

Our bookkeeper has nothing in the records of the office to show when you intend to pay the enclosed account. Perhaps the previous statements and reminders may have been overlooked or ignored.

Following the rule of this office, this overdue account will be sent to the collecting agency within ten days if arrangements for its settlement are not made prior to that time.

This collection bureau method is disagreeable to us; and we believe, also to you. By promptly sending your check all this can be avoided.

When an account is sent to the collecting agency that organization takes full charge of it thereafter.

In the September, 1927, issue of California and Western Medicine, page 398, appeared an article relating to the "collection of fees." Following this publication so many orders were received by us for printing the series of gum stickers and notices, we decided to print and stock the series in large quantities.

That we were justified in this decision is evidenced by the fact that thousands of these notices have been used by the medical profession of California. They *get* results. Many users of the system have reordered the series.

You, too, can profit by using the system for your delinquent accounts. They are inexpensive and easy to use.

The prices, including postage, are:

250	$ 6.75
500	9.00
1000	13.50

There Is a Way of

"TELLING THE PHYSICIANS' STORY ETHICALLY"

A Director of the Physicians Expansion Bureau has been, or soon will be, in each city throughout the State to outline a plan of ethical advertising that will be scheduled to appear in each local newspaper weekly. The plan will be sponsored by one of the outstanding Prescription Druggists in each city. A large number of druggists have already sponsored this plan. Our yellow emblem identifies these stores.

These Better Health Talks that are to appear in the local newspaper weekly are designed to promote a closer relationship between the public and the Physicians. They also tend to counteract some of the detrimental propaganda fostered by the manufacturers of nostrums and cure-alls.

The coöperation of all Physicians is necessary in furthering this gracious gesture.

Physicians Expansion Bureau
Longacre Building
NEW YORK, N. Y.

AVAILABLE THROUGH ALL PHARMACIES

EMMENIN

The orally active, oestrogenic placental extract elaborated by Dr. J. B. Collip, Department of Biochemistry, McGill University.
(Canadian Medical Association Journal, February, 1930.)

IMPORTANT ANNOUNCEMENT . . .

By an improved technique developed in our laboratories, we have been able to render Emmenin entirely free from disagreeable taste and odor. This has been accomplished without loss of therapeutic activity, and the potency is ensured by carefully controlled biological assay.

DETAILS ON REQUEST

Emmenin is biologically assayed and standardized under direct control of the Department of Biochemistry, McGill University.

Manufactured by
Ayerst, McKenna & Harrison
(United States) Limited
Biological and Pharmaceutical Chemists

THE MALTINE COMPANY

and its relation to the medical profession

1 Since its founding, over 60 years ago, The Maltine Company has adhered to the most rigid ethical practices. Our product is advertised solely to the medical profession.

2 Our product is scientifically made and standardized.

3 Our modern laboratories are continually studying the biological reactions to administrations of MALTINE WITH COD LIVER OIL, in order that the achieved standard of quality may be maintained.

4 Constantly conducted animal tests indicate that the vitamin A efficacy of cod liver oil is enhanced *twofold* when emulsified in MALTINE, as in MALTINE WITH COD LIVER OIL.

5 MALTINE WITH COD LIVER OIL has been found an effective and palatable agent for administering the cod liver oil vitamins A and D. It also contains vitamins B and G and valuable mineral salts.

6 MALTINE WITH COD LIVER OIL and Iron Iodide is also available, containing two grains of freshly prepared iron iodide per fluid ounce.

7 Our personnel is trained to confer with physicians and offer such authentic information as may be desired.

Hynson, Westcott & Dunning, Inc.
BALTIMORE, MARYLAND

Quadruplets in the United States.—In the period 1915-1931 (since establishment of the United States Registration Area), there have been fifty sets of quadruplets registered, distributed as follows:

Alabama	2	Mississippi	2
Arkansas	1	Missouri	2
California	3	New Jersey	1
Connecticut	1	New York	1
Illinois	1	North Carolina	3
Indiana	2	Ohio	3
Kansas	1	Pennsylvania	6
Kentucky	2	South Carolina	1
Louisiana	1	Tennessee	1
Maryland	1	Utah	1
Massachusetts	2	Virginia	4
Maine	1	West Virginia	2
Michigan	2	Wisconsin	1
Minnesota	1	Wyoming	1

They are distributed by years as follows:

1916	2	1925	5
1919	1	1926	3
1920	6	1927	6
1921	1	1928	3
1922	4	1929	3
1923	3	1930	7
1924	4	1931	2

Three states recorded two sets of quadruplets in one year: Pennsylvania in 1922, Ohio in 1920, and Virginia in 1927 and again in 1930.

Pennsylvania has recorded births of quadruplets in five different years (1916, 1919, 1920, 1922 (two) and 1926); California (1920, 1922, 1923) and North Carolina (1924, 1925, 1930) in three different years; Alabama (1927, 1929), Indiana (1924, 1925), Kentucky (1922, 1928), Massachusetts (1926, 1928), Michigan (1916, 1930), Mississippi (1924, 1931), Missouri (1928, 1931), Ohio (1920 (two) 1925), Virginia (1927, (two), 1930 (two)), and West Virginia (1925, 1930) in two different years each.

Of the fifty sets, thirty-one had all the children born alive, six had three of them live births, while there were three each with two and one liveborn children, and seven cases in which all four children were stillborn; fifteen sets were made up of males only, while there were only ten sets entirely of females; six sets were composed of three males and one female; eleven sets, two males and two females; and eight sets one male and three females. In the entire fifty sets, 108 were males and ninety-two were females.

Where all the children were living at birth, ten sets were all males; five sets were all females; five sets were two males, two females; four sets, three males, one female; seven sets, one male, three females.

Where all were stillborn, there was one set all females; one set, one male, three females; three sets, two males, two females; and two sets, three males, one female.

"Marmola Silenced."—Under the caption "Marmola Silenced," the magazine *Time* recently printed the following item:

> For thirty years a crafty old Detroiter called Edward D. Hayes, vendor of nostrums, has dodged the United States postoffice, the Federal Trade Commission, Federal courts, Better Business Bureaus. Twenty years ago he slipped, was arrested and fined $5,000 and had his sucker list of 500,000 names destroyed for overshouting "Doctor Robinson's Prescription for Nervous Debility, Lack of Vigor, Failing Memory and Lame Back Brought on by Excesses, Unnatural Drains or the Follies of Youth." Publications like the *Police Gazette* and *Baptist Record* carried his advertising.
>
> Doctor Hayes's latest nostrum is Marmola, a tablet containing thyroid substance, which he markets over drugstore patent medicine counters as a cure for obesity. Like all thyroid preparations, Marmola may cause a user to drop dead, or cripple his heart, unless a physician stands by to control the dosage and reduction in weight. Vainly various agencies have tried to stop the sale of Marmola. Last week the Federal Communications Commission tried its hand by threatening to take licenses away from twenty-one radio stations from Rochester to San Francisco, Los Angeles to Miami, if they did not cease broadcasting Marmola advertisements.

The pleasures of the senses pass quickly; those of the heart become sorrows; but those of the mind are with us even to the end of our journey.—Spanish Proverb.

CO-OPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California and Nevada Associations. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

SAN FRANCISCO POLYCLINIC AND POSTGRADUATE COLLEGE

WM. E. STEVENS, Pres. OTTO G. FREYERMUTH, Sec'y

THE CONTINUOUS COURSE IN

OPERATIVE SURGERY

BEGINS MARCH 3, 1936

The course will include a foundation in Anatomy, Surgical Pathology, Diagnosis, and Operative Technic. As supplementary to the work on cadavers, and fresh human material, lectures and demonstrations will be given on the living by leading surgeons of San Francisco. The hours will be arranged so as not to interfere with the practice of physicians in San Francisco and nearby cities and towns. Opportunity will be given to assist in operations, and some of the work will be done by the students themselves. The course will run every Tuesday from 11 to 3 o'clock.

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information, inquire of

SAN FRANCISCO POLYCLINIC AND POSTGRADUATE COLLEGE, or

A. J. REMMEL, M. D., *Director of Operative Surgery* 1535 JACKSON STREET, SAN FRANCISCO

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

Obstetrics and Gynecology

A full-time course. In Obstetrics: lectures; prenatal clinics; witnessing normal and operative deliveries; operative obstetrics (manikin). Gynecology: lectures; touch clinics; witnessing operations; examination of patients, pre-operatively; follow-up in wards post-operatively. Obstetrical and Gynecological pathology. Regional anesthesia (cadaver). Attendance at conferences in Obstetrics and Gynecology. Operative Gynecology on the Cadaver.

For the GENERAL SURGEON

A combined surgical course comprising General Surgery, Traumatic Surgery, Abdominal Surgery, Gastro-Enterology, Proctology, Gynecological Surgery, Urological Surgery, Thoracic Surgery, Pathology, Roentgenology, Physical Therapy, Operative Surgery and Operative Gynecology on the Cadaver.

Address, Box 200, c/o California and Western Medicine, 450 Sutter Street, San Francisco.

FOR SALE—VICTOR ELECTROCARDIOGRAPH—slightly used, in perfect condition. Priced right. Owner, address Apt. 319, 5217 Hollywood Boulevard, Los Angeles, Calif.

Economy of Dextri-Maltose.—It is interesting to note that a fair average of the length of time an infant receives Dextri-Maltose is five months; that these five months are the most critical of the baby's life; that the difference in cost to the mother between Dextri-Maltose and the very cheapest carbohydrate, at most is only $6 for this entire period—a few cents a day; that, in the end, it costs the mother less to employ regular medical attendance for the baby than to attempt to do her own feeding, which in numerous cases leads to a seriously sick baby, eventually requiring the most costly medical attendance.

Oral Immunization to Colds.—Rockwell and his collaborators immunized a large group of persons orally to the secondary invaders of colds, using a vaccine made up of heterophile antibodies. The 500 patients who took the vaccine came from various walks of life, and the 536 persons used as controls were chosen from the same environment. The average number of colds each patient had annually in the past three years, age, sex, occupation and allergic history were obtained before the vaccine was given. The oral cold vaccine was made from pneumococci and streptococci. Since the desired immunity was a nontype specific heterophile active immunity, a single pneumococcus strain was used. This strain was DR-I, a well-known nonpassaged, and mainly rough, variant from the Neufield Type I pneumococcus. The streptococcus was a hemolytic mouse-virulent laboratory strain. The treatment consisted of the ingestion of one capsule of starch adsorbed vaccine containing one hundred billion pneumococci and one hundred billion streptococci with a half glassful of cold water each morning before breakfast for seven consecutive mornings, after which term one capsule each week was taken throughout the season. Of the 500 treated cases, thirty-eight had a history of continuous colds, while 425 had a history of from one to eight colds annually per person. Among the 536 controls, nine had a history of continuous colds, while 527 had a history of from only one to eight colds annually per person. Among the forty-seven patients who gave a history of continuous colds, the thirty-eight who were given the oral cold vaccine had, for that year, a total of only forty-one colds, thus passing from a stage of continual coryza to an average of 1.08 colds per person, while of the nine persons used as controls, only one reported a less severe type this year. Among those who for the past three years had a history of from one to eight colds annually per person, 462 patients, having a yearly average total during the previous three years of 1,400 colds or 3.03 colds per person annually, while taking the vaccine this year had a total of only 604 colds, or an average of 1.3 colds per person and 1.73 colds less per person, a decrease of 57 per cent. The 527 persons used as controls had a yearly average total, for the past three years, of 1,314 colds, or 2.49 colds per person annually. During the school year 1933-1934 this group had a total of 1,156 colds, or 2.19 colds per person, which is 0.3 cold less per person, or a decrease of 12 per cent. The essential decrease due to the oral cold vaccine is thus 45 per cent. The relationship between the response of the individual to the heterophile antigen and his incidence of colds is given in a separate article.—*Journal of Immunology.*

Fifty Years of Service.—Acclaimed as one of the men who have accomplished much in the promotion of public health and the saving of human lives, as a result of work in biologic science, Dr. H. K. Mulford was honored with a dinner in celebration of his golden pharmaceutical anniversary at the Union League, Philadelphia, on the evening of October 31, 1935, by a group of distinguished scientists, physicians, chemists, pharmacists, and educators. The event was sponsored by the National Drug Company, Charles E. Carr acting as chairman. Dr. Wilmer Krusen, president of the Philadelphia College of Pharmacy and Science, ably served as toastmaster.

Roddis, Medical Corps, U. S. Navy, in charge. Compiled and published under the authority of Naval Appropriation Act for 1935-36, approved June 24, 1935. Paper. Price, 25 cents. Washington: United States Government Printing Office, 1935.

BOOK REVIEWS

Doctors and Juries. The Essentials of Medical Jurisprudence. By Humphreys Springstun. Pp. 155. Philadelphia: P. Blakiston's Son & Co., Inc., 1935. Price, $2.

On commencing practice, the medical man finds himself more or less well prepared to cover those portions of his practice concerning the physician-individual patient relationship. Soon, however, he is faced with problems concerning his duties and responsibilities under the law: the matter of privileged communications; narcotic legislation; malpractice allegations; the relation of medicine to one or another type of insurance. He is called to court as a "fact" or "opinion" witness. He is asked for opinion in matters where pathology or toxicology touch the law. He will have to obtain permission to make postmortem examinations and know the penalties for performing them without proper authority.

The practicing physician is called on for opinion concerning disease or disability in relation to occupation and concerning injuries in which there is alleged industrial or other liability.

In most communities of the United States the graduating medical man commences practice without any adequate preparation to meet these problems.

It is almost the universal experience of medical men to have their first taste of commission or court, or any form of legal machinery, when they find themselves summoned like a bolt out of the sky into a strange arena for which they are unprepared and in which they find their expected embarrassment warranted or unwarranted. Certainly an earlier understanding of the "law in action" at a time when one is not personally involved is in order.

Lacking an adequate preparation in the medicolegal field during medical school training, it is actually a requirement that the physician include in his library certain books on legal medicine.

Springstun has written one of the better of such books, of which incidentally there are very few, that is very few of the type that is concise, to the point, and authoritative. Here, in 155 pages, the physician may find ready and sound answers to questions concerning his contractual relations, alleged malpractice, privileged communications, the relation of insanity to law, the physician in court, etc.

BOOK REVIEWS

(Continued from Preceding Page)

Diseases of the Nose and Throat for Practitioners and Students. By Charles J. Imperatori and Herman J. Burman. Pp. 723. Illustrated. Philadelphia: J. B. Lippincott Company, 1935. Price, $7.

This new textbook is admirably written, as its title indicates, for practitioners and students.

The text is remarkably well organized and the index is excellent. The discussions on pathology are the outstanding feature of this work. There is a great deal of repetition in the first five chapters which overemphasize elementary procedure and take up too much space. The technique of simple procedures is painstakingly described, whereas major surgical procedures are quite sketchy. The chapter on cocain is timely, as is also the stimulating discussion on the diagnostic value of Roentgen examinations of sinuses by Frederick M. Law. The chapter on physical therapy should be very valuable, as it most concisely and clearly explains the various agents and their actions, namely infra-red rays; ultra-violet rays; diathermy; coagulating, dessicating and cutting currents; the new ultra-short wave; ionization; Roentgen rays and radium. The chapters on endoscopy and diseases requiring it are quite comprehensive.

In keeping with recent progress, more space might have been allotted to discussions on allergy and constitutional diseases affecting the nose and throat, including endocrine dysfunctions and metabolic disorders associated with vitamin deficiency. The lack of references depreciate from the value of this comprehensive and well organized textbook.

S. V. C.

A Textbook of Clinical Neurology With an Introduction to the History of Neurology. By Israel S. Wechsler. Third edition. Pp. 826. Illustrated. Philadelphia and London: W. B. Saunders Company, 1935. Price, $7.

This excellent textbook with revisions bringing it up to date will merit in the future the popularity which it has enjoyed in the past.

The book is admirably designed for students and practitioners by reason of its compactness. The use of italics

is particularly helpful. At the chapter ends are well selected references for future reading.

There has been added an introduction to the history of neurology of some forty pages which starts with the Edwin Smith papyrus 2500 B. C. and ends with June, 1935. It consists chiefly of a list of names, some of which get fairly extended notice, while others are merely mentioned. It is a very helpful catalog.

The sixty or more pages on the neuroses necessarily are inadequate. One cannot say enough about neuroses in sixty pages. The beginner will not get enough out of it to be of much value and the more advanced will be even less satisfied. The tone is strictly Freudian with very little tolerance for variance in the slightest from the master.

to pressure and an examination of the nose reveals thick yellow pus in the region of the middle turbinate, we can say with a fair degree of certainty that we are dealing with an acute inflammation of the ethmoid cells and the frontal sinus. . . .

From an article on "Some Points on the Etiology and Treatment of Enuresis" by E. C. Fleischner, M. D., San Francisco.

No one has seen many children suffering from enuresis without asking the question, "Why are the results of treatment so preëminently unsatisfactory?" The answer to this question is that enuresis is essentially not a clinical entity, but a clinical symptom. No one would endeavor to treat headache without attempting to discover its cause; likewise, no one would endeavor to remove abdominal pain without locating the responsible viscus. On the contrary, it is lamentable to note that belladonna or the bromides are usually prescribed in the treatment of enuresis without thought being given to the etiological factor. . . .

From an article on "Criminal Abortion" by J. Henry Barbat, M. D., San Francisco.

The desire to prevent conception or to get rid of the products of conception, is as old as mankind. I do not expect to be able to change the condition of affairs as it exists at present, but I do believe that a proper exposure of the methods of the criminal abortionists, and the adoption of laws to prevent them from flaunting their dastardly vocation in the face of the public, would result in saving the lives of a large number of innocent victims, and in preserving the chastity of numerous girls. . . .

From an article on "Report of Ophthalmological Cases" by F. A. Hamlin, M. D., San Francisco.

. . . Among the causes of squint may be mentioned: (1) Disturbance of relation between accommodation and convergence by errors of refraction. (2) Disparity in length, thickness, or tension of opposing muscles. (3) Size and shape of eyeball and orbit. (4) Influence of angle gamma. (5) Amblyopia of one eye.

Treatment of convergent concomitant squint may be briefly outlined under three headings: (1) Spectacles. (2) Orthoptic training, *i. e.*, the child must see double or be trained to see double and then taught to fuse the double images (this necessitates much time, care, and detail). (3) Operative methods: (*a*) Tenotomy of the internal rectus, or (*b*) advancement of the external rectus, or (*c*) both. . . .

From an article on "The Value of Rest in the Treatment of Pulmonary Tuberculosis" by Robert A. Peers, M. D., Colfax.

The marked changes that have been made during the past two decades in the treatment of tuberculosis is in no way better illustrated than in the shifting of position in the attitude of the members of the medical profession regarding the value of rest in this disease. We can all remember the period when, with the knowledge of the advantages of outdoor living, came the advice to tuberculous patients to exercise. . . .

From Proceedings, Pacific Coast Association of Railway Surgeons:

From an Article on "Crusade Against the Anophele Mosquito" by T. B. Reardan, M. D., Oroville.—When Laveran, in 1882, discovered the parasites in the blood of those ill with malarial fevers, an opening wedge was driven, which has finally made clear the way for the control, and one might say, the elimination of such fevers in any given locality. Patrick Manson found the mosquito to be the host of the parasite, and Sir Ronald Ross that it inoculated the human through its bite. . . .

✓ ✓ ✓

From an Article on "Hookworm Disease Among Mexican Track Laborers" by John W. Colbert, Albuquerque, New Mexico. — Our "late unpleasantness with Spain" brought the subject of hookworm disease to the attention of the medical profession in this country—first, through the extensive work of Ashford and King in Porto Rico, and then the investigations of Stiles demonstrated the presence of the disease in our own Southern States. I believe it was Herbert Gunn of this city who first demonstrated its presence in California. . . .

From San Francisco County Medical Society Proceedings:

"President's Address" by Langley Porter, M. D., San Francisco.— . . . A committee headed by one, who through many years of active life has devoted much time and thought to the welfare of your Society, Dr. C. G. Kenyon, has been working on a plan for housing the Society in a fitting manner. This plan will be presented to you, and even if it should fail to receive your endorsement, the labors of Doctor Kenyon and his committee place the Society under great obligation. . . .

Benzedrine Inhaler

A *VOLATILE* VASOCONSTRICTOR

The vapor form of Benzedrine Inhaler presents obvious advantages over liquid non-volatile vasoconstrictors.

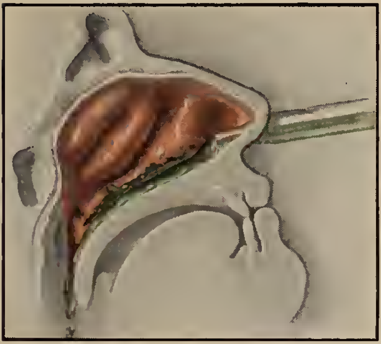

Fig. 1. The distribution of a liquid inhalant when applied by a dropper.

The solution does not reach beyond the lower border of the inferior turbinate, the bulk of the liquid gravitating to the pharynx. The spaces between the turbinates, where the congestion is greatest, have not been reached.

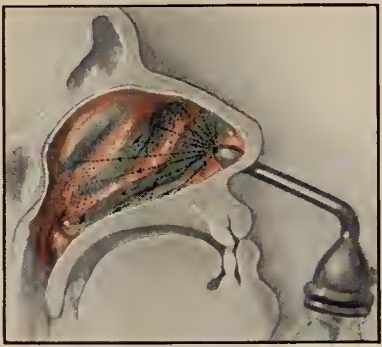

Fig. 2. The distribution of a liquid inhalant when applied by a spray or atomizer.

The inferior turbinate intercepts the bulk of the liquid intended for the middle and upper meati, sites of greatest congestion. The excess liquid is deflected to the roof of the hard palate, whence it reaches the pharynx.

ACCEPTED
AMERICAN MEDICAL ASSN.
Council on Pharmacy and Chemistry

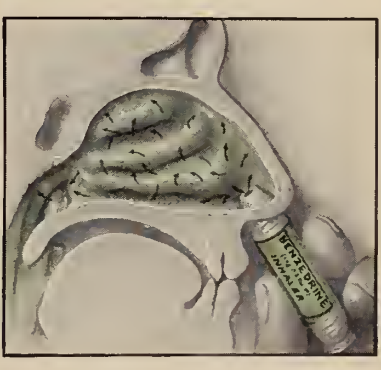

Fig. 3. The distribution of a vapor when sniffed up the nose by means of an inhaler.

The vapor diffuses throughout the entire upper respiratory tract, reaching and reducing congestion wherever it exists.

Benzedrine Inhaler* combines VOLATILITY with a potency equal to or greater than that of ephedrine. Yet ephedrine-like reactions such as atony and returgescence are "so slight as to be virtually negligible." (Scarano: Med. Record, Dec. 5, 1934.)

*Each tube is packed with benzyl methyl carbinamine, .325 gm.; oil of lavender, .097 gm.; menthol, .032 gm.

SMITH, KLINE & FRENCH LABORATORIES · PHILADELPHIA

CONVENIENCE...

Your patients will appreciate its convenience when you prescribe Benzedrine Inhaler in common nasal conditions. No atomizers, sprays or drops are necessary, and the little aluminum tube can be carried in pocket or handbag.

Because it can be used inconspicuously at any indicated time to bring relief in the midst of business or social activities, Benzedrine Inhaler encourages the full co-operation of your patients.

TWENTY-FIVE YEARS AGO

(Continued from Page 15)

Now in San Francisco we have what is certainly the seventh, probably the sixth, largest collection of medical literature in America, which has behind it a fund of some $80,000 or $100,000, and what is more important still, it has behind it the library organization of Stanford University. . . . The Stanford trustees, convinced that the best interests of medicine are to be served by centering the intellectual interests of medicine in one building, are prepared to supply to the county society, shelf room for this Society's library and to provide offices and assembly rooms for the Society's meetings at a cost to the Society of about what the rental of such inadequate quarters as these we now occupy would be. . . .

In closing, I would quote to you from the first presidential address made to the Society by Doctor Whitney, its first president, in 1868:

"A few weeks ago a gentleman whose qualifications as a regular practitioner no one can question, invited to his residence several members of the profession to consider the propriety of organizing a medical society. Those who responded to that invitation represented the different nationalities of which the profession is here composed. It was unanimously resolved that steps be taken to bring together as large a number of those who are known or believed to belong to the regular profession here, as possible for the purpose of forming a society."

After two or three preliminary meetings, with increased numbers, it was decided to send a notification to every practitioner in the city believed to be a regular member of the profession. This brought together a sufficient number to divest the meeting of anything like partisanship, and then forthwith proceeded to organize under the name of the "San Francisco Medical Society" by adopting a constitution and by-laws. The code of ethics framed, adopted and recommended by the American Medical Association constitutes the basis of our organization, and to this our constitution and by-laws conform. . . .

Secretary's Report.—Mr. President and Members of the Society: As secretary I beg leave to submit the following report for the year 1910, *i. e.,* from the twenty-second day of January, when I took charge of this office, to December 10, inclusive.

Number of members in Society, January 22, 1910	482
Admitted	43
Resigned	9
Transferred to other county societies	6
Died	7
Dropped for nonpayment of dues	27
Number of members in Society, December 10, 1910	476

Opposition to Our Defense Plan.—The agents of at least one commercial company, we are told on good authority, are spreading the startling information throughout the State that there are so many malpractice suits now in actual progress that to pay for their defense would take several times the amount of money the California State Medical Society will raise. If this were true it would mean the premature end of our defense plan, but these agents tell only part of the truth. . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 144)

"David George Allen, believed by investigators to have conducted an illegal operation clinic in a building on North Euclid Avenue, yesterday was charged with murder in a complaint issued by Deputy District Attorney John W. Loucks. He was accused of responsibility for the death of Mrs. Evelyn Scurlock, 131½ Raymond Street, Alhambra, last November 20, from an illegal operation. Allen is said to have performed on her November 16. George Clair Scurlock, husband of the dead woman, was charged jointly with murder. He has not been apprehended. . . ." (Pasadena *Post,* December 5, 1935.)

"Dr. R. B. Smith, 83-year-old physician, yesterday pleaded guilty in federal court to selling narcotics through the mails. His case was referred to Probation Officer Charles Upton, who will report Saturday. G. B. Hjelm, Assistant United States Attorney, has recommended probation. . . ." (Sacramento *Union,* December 17, 1935.)

"A new racket, reportedly aimed at San Francisco's thirteen midwives, was revealed by public health officers here yesterday. Inspectors of the Bunco Detail began an investigation aimed at the arrest of two men representing themselves as officials of the health department, who assertedly demanded a $5 license fee from one of the midwives. When she paid the $5, she told police, she found the receipt given her was an order for $5 worth of advertising in minor local newspapers. No one is authorized to collect any fees from midwives in this city, Dr. J. C. Geiger said." (San Francisco *Examiner,* December 18, 1935.)

"Charged with issuing unlawful narcotic prescriptions to addicts, Dr. William Tatum, Riverside physician, was arrested yesterday by federal narcotic agents. Agents asserted he had issued a large number of prescriptions, charging a $5 fee in each case. Three asserted addicts were taken into custody." (Los Angeles *Illustrated Daily News,* November 28, 1935.)

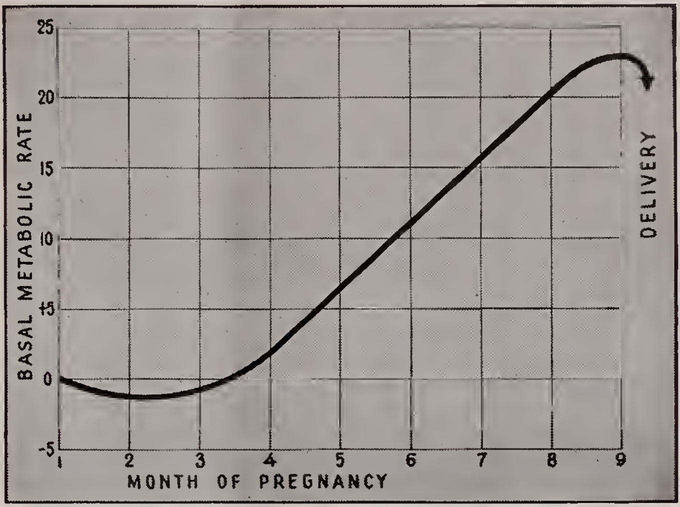
"Dr. Hugo Foss, 76-year-old physician of 257 South Spring Street, went on trial before a jury today in Municipal Judge Falconer's Court, charged with fourteen counts of illegally issuing prescriptions to narcotic addicts. Deputy City Attorney Franklin Potter was prepared to present several witnesses in an attempt to prove that some of Doctor Foss' patients allegedly received as many as one hundred prescriptions in a year for morphin." (Los Angeles *Herald-Express,* December 19, 1935.)

Eyesight swindlers are again active in California. On January 2, 1936, Sheriff Rayburn of Riverside sent out an all-point bulletin, announcing that two swindlers using the time-worn "radium water" drop racket had swindled an elderly individual in his vicinity out of $75. Swindler No. 1 used the name A. C. Meuller, described as age 45 to 50, height 6 feet, weight 185, dark hair and eyes. Swindler No. 2 used the name John Doe Reed, age 50, height 5 feet 9 inches, weight 150, build slim, dark hair and eyes, wears glasses, has thin face and hollow cheeks.

Reports relate that J. E. S. C. Morandi on December 6, 1935, pleaded guilty to a violation of the Medical Practice Act in the justice court of San Diego and was sentenced to pay a fine of $100 or serve twenty-five days in jail on each count. He was committed to jail on the first count,

(Continued on Page 20)

PROTECTING THE EXPECTANT MOTHER



NORMAL PREGNANCY has its disturbances. During the first half of pregnancy the woman's metabolic rate is not changed. After the fourth month it gradually increases to 23% above her norm. Caloric increase in the diet is thus necessary after the fourth month.

But vomiting of pregnancy interferes! The condition is looked upon today as a disturbance in carbohydrate metabolism. Upon this assumption is based the present-day treatment by carbohydrate diet. The early introduction of small carbohydrate meals at 3 hour intervals helps prevent this disturbance. Karo added to foods and fluids prevents glycogen depletion and ketosis.

The enlarging of the uterus further produces reflex vomiting and unless carbohydrate is taken throughout the day to maintain the blood sugar at a high level, ketosis results. This aggravates the vomiting, frequently beyond control, because of the inability of the damaged liver in pregnancy to resist ketosis. Karo helps provide the expectant mother with readily assimilated sugars preventive of ketosis. Karo consists of dextrins, maltose and dextrose (with a small percentage of sucrose added for flavor), not readily fermentable, rapidly absorbed and effectively utilized.

and sentence on the second and third count was suspended. This is the individual referred to in the January "News" as claiming to have been the personal physician of Haille Selassie. It was reported that the Federal Department of Justice records show Morandi was arrested in Des Moines, Iowa, March 31, 1931; in Ashland, Kentucky, February 7, 1934.

"The whole end and object of education," said Aristotle, "is training for the right use of leisure." It is only recently, however, that the full practical import of this declaration has made itself felt. In the first place, the amount of leisure time has been increasing and seems destined to even more rapid increase in the near future. In the second place, urban civilization has disrupted traditional leisure pursuits and the individual's control over his own leisure, thus making necessary community action on the subject.—George A. Lundberg.

The Killing Diseases of Childhood in California.—The Bureau of Epidemiology of the California State Department of Public Health has compiled a tabulation of cases and deaths from communicable diseases in California for a period of five years, according to age groups. The data are valuable because they indicate the present trend of devastation due to communicable diseases, and provide an index which may be useful to health officers, physicians and individuals who are directing intensive efforts toward the prevention of illness and deaths among children. The trend of communicable diseases during the five years 1928-1932 will be discussed in each group that is involved in the study.

Under One Year.—During the five-year period, 1928-1932, inclusive, 10,698 cases of communicable diseases and 2,479 deaths from such diseases were reported among children under one year of age in California. The most prevalent disease among such children and the disease having greatest killing power was whooping cough. Forty-two and one-half per cent of all cases of communicable diseases in infants and 28.28 per cent of all deaths among such infants was due to whooping cough. During this period 4,546 cases of whooping cough in infants, with 701 deaths, were reported.

Measles was the next most prevalent disease among infants. There were 1,941 reported cases (18.14 per cent) with 101 deaths (4.07 per cent).

Chickenpox was next in prevalence, 1,873 cases (17.50 per cent) having been reported, but for this disease there is no mortality rate. Five hundred forty-one deaths (almost 22 per cent of all infant deaths during the five-year period) were reported as due to influenza. There is a possibility that some of such deaths were due to other causes.

Among infants, during the five-year period, 296 cases of tuberculosis in all forms were reported, which represents 2.77 per cent of all communicable disease cases in infants reported during the period. On the other hand, there were 392 deaths from tuberculosis in infants registered, which represents 15.81 per cent of total deaths from communicable diseases in this group. There were 443 cases of venereal diseases in infants reported (4.14 per cent) and 286 deaths from venereal diseases were registered (11.54 per cent of the total). During this five-year period there were 270 cases of diphtheria reported in infants, with fifty-six deaths.

It would appear, then, that whooping cough is of first importance as a killer of children under one year of age in California. If contact with active cases

(Continued on Page 22)

More satisfactory results with *an arsphenamine* plus *a heavy metal*

Adequate arsphenamine therapy, supplemented with a heavy metal preparation, offers the surest means of arresting and curing syphilis. Continuous treatment is important if neuro-recurrences are to be prevented and maximum curative results obtained. This treatment should consist of a sufficient number of doses of the arsenical plus an adequate number of injections of the heavy metal.

Neoarsphenamine and Iodobismitol with Saligenin—two products by Squibb—are of distinct advantage in the treatment of syphilis. Iodobismitol with Saligenin is a propylene glycol solution containing 6% sodium iodobismuthite, 12% sodium iodide and 4% saligenin (a local anesthetic). It provides bismuth in anionic (electro-negative) form.

Iodobismitol with Saligenin is rapidly and completely absorbed and slowly excreted, thus providing a relatively prolonged bismuth effect. Repeated injections are well tolerated in both early and late syphilis.

Neoarsphenamine Squibb is readily and rapidly soluble and possesses uniformly high spirocheticidal power and low toxicity. Arsphenamine and Sulpharsphenamine are also available under the Squibb label.

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack
and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M.D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer Wassermanns, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

ARTHRITIS

Clinical tests show 75% satisfactory results in the treatment of Arthritis with Hollister-Stier Bacterial Vaccine.

(BURBANK FORMULA)

Hollister-Stier Arthritis Vaccine contains a large number of strains of Streptococci, Staphylococci and a few strains of Diphtheroid Bacillus, all isolated from over three hundred active cases of arthritis. Most of these strains have been tested by complement fixation, also therapeutically, and have been found to be specific for this condition.

Hollister-Stier Arthritis Vaccine is put up in three dilutions, namely: One million, ten million, and one hundred million organisms per cubic centimeter. These dilutions are designated as dilutions A, B and C. A treatment consists of a 5 c.c. ampoule of each of the above dilutions. Additional ampoules of the C suspension may be obtained separately.

(Continued from Page 20)

could be prevented this record might be made very much better. The responsibility rests largely upon parents. The health officer's most important duty lies in the instruction of parents in the dangers of this disease and the necessity for providing effective safeguards against its contraction.

Together, measles and whooping cough constitute more than 60 per cent of all cases of communicable diseases reported in infants, and together they are responsible for almost one-third of all deaths that occur in this age group. The tabulation of morbidity and mortality for children under one year of age follows:

Communicable Diseases and Deaths in Children Under One Year, California, 1928-1932

	Cases		*Deaths*	
Disease	*No.*	*Per Cent*	*No.*	*Per Cent*

deaths from tuberculosis among these children out of 1,397 cases reported. The cases represented but 1.92 per cent of the total reported, while the deaths represented 33.01 per cent of total deaths that occurred in this group. Next to tuberculosis, diphtheria took the greatest number of lives, 415 such deaths (13.35 per cent) having occurred out of 3,619 cases reported. Diphtheria cases, however, represent less than 5 per cent of the total of all cases of epidemic diseases reported in this age group. Influenza, with 397 deaths (12.77 per cent), was next in importance as a killer of children from one to four years of age. As in the infant group, there may be a question as to the exact cause of death under this title. Next to diphtheria, whooping cough claimed more lives of children in this group. There were 384 deaths out of 19,315 cases reported (more than 25 per cent of the total cases reported). It is obvious that whooping cough is important, too, as a slayer of children from one to four years of age. More than 9 per cent of all deaths in this age group were due to measles and more than 25 per cent of all cases reported were of this disease.

In children from one to four years of age, it is obvious that tuberculosis is most destructive. Diphtheria is important as a direct cause of death, but measles and whooping cough in this age group constituted 52 per cent of all cases of communicable disease and, together, they claimed almost 20 per cent of deaths from communicable diseases.

Venereal diseases claimed few lives in this age group and while there were nearly 100 deaths from epidemic poliomyelitis (3.15 per cent of the total) this disease constituted less than 1 per cent of the total morbidity. Measles and whooping cough as producers of after effects that may be highly injurious in later life must not be lost sight of in weighing the damage of communicable diseases among children from one to four years of age. The tabulation of morbidity and mortality for children from one to four years of age during this five-year period follows:

Communicable Diseases and Deaths in Children One to Four Years of Age, California, 1928-1932

	Cases		*Deaths*	
Disease	*No.*	*Per Cent*	*No.*	*Per Cent*
Measles	18,411	25.35	282	9.07
Chicken pox	15,433	21.35	......	......
Mumps	4,500	6.20	......	......
Whooping cough	19,315	26.60	384	12.36
Scarlet fever	5,966	8.22	86	2.77
Diphtheria	3,619	4.98	415	13.35
German measles	1,096	1.51	......	......
Tuberculosis (all forms)	1,397	1.92	1,026	33.01
Smallpox	563	.78	3	.10
Venereal diseases	576	.79	34	1.09
Poliomyelitis	672	.92	98	3.15
Typhoid fever	179	.25	15	.48
Meningitis (epidemic)	278	.38	136	4.38
Erysipelas	219	.30	......	......
Dysentery (bacillary)	279	.38	105	3.38
Tetanus	36	.05	......	......
Malaria	18	.03	3	.10
Encephalitis (epidemic)	32	.04	29	.93
Undulant fever	11	.02	......	......
Other epidemic diseases	24	.03	95	3.06
	72,624	100.00	3,108	......

Five to Fourteen Years.—In this age group the greatest numbers of cases of communicable disease were reported. During the five years covered by this report 268,029 such cases were reported, as compared with 72,624 cases in the one to four years age group, and 10,698 in the under one year age group. In this older group, tuberculosis again appears as the chief cause of death, more than 40 per cent of all deaths having been due to this disease. Diphtheria was next in importance as a death factor, 16.2 per cent of all deaths having been due to this disease.

Meningitis is more destructive in this age group than in the younger groups. There were 190 deaths (7.11 per cent) from this cause out of 410 cases reported.

It is interesting to note that mumps was conspicuously present in the five to fourteen year age group.

(Continued from Preceding Page)

There were 46,660 cases (17.41 per cent) of this disease reported, but mumps is not a factor in mortality. In the lower age groups mumps was inconspicuous. Chicken pox, too, was more prevalent in this age group, 68,220 cases (25.45 per cent of the total) having been reported. More than 26 per cent of all communicable diseases in the five to fourteen year age group constituted measles cases, of which 70,655 were reported. As a factor in mortality, however, measles is less conspicuous in this age group. Epidemic poliomyelitis was responsible for the deaths of 4.45 per cent of children in this group and scarlet fever was responsible for 5.16 per cent of such deaths. On the other hand, more than 10 per cent of all cases of communicable disease reported in this group was scarlet fever cases, of which 27,480 cases were reported.

Summary.—During the five-year period 1928-1932 in California 10,698 communicable diseases were reported in children under one year of age. There were 24,038 deaths from all causes in this age group, 2,479 of which were due to epidemic diseases. The percentage of total deaths due to epidemic diseases was therefore 10.31 per cent.

There were 72,624 cases of communicable diseases in children from one to four years of age. The total deaths among children of this age group was 8,814, of which 3,108 were due to epidemic diseases. The percentage of total deaths due to epidemic diseases in this age group was 35.26 per cent.

Among children from five to fourteen years of age during this period, 268,029 cases of communicable disease were reported. In this age group there were 9,173 deaths from all causes, 2,673 of which were due to epidemic diseases. The percentage of total deaths due to such causes was 29.14 per cent. The greatest risk to life from epidemic diseases occurred in the one to four year group, followed closely by the five to fourteen year group. The importance of whooping cough, tuberculosis and venereal disease in the production of infant deaths is most conspicuous.

The importance of tuberculosis as a cause of death in the one to four year age group, the wide prevalence of both measles and whooping cough, and the increasing importance of poliomyelitis and meningitis are outstanding factors in the one to four year age group.

In the five to fourteen year age group tuberculosis as a cause of death is increasingly important. Diphtheria, too, caused a higher proportion of deaths in this older group than in the younger groups. Epidemic meningitis and epidemic poliomyelitis also took a heavy toll among these older children. The wide prevalence of measles and whooping cough in this group must not be overlooked and due consideration must be given to the rôle that these diseases

(Continued on Page 26)

"Kiss me goodbye, darling—

and eat your apple on the way to school"

MOTHERLY kisses are all right, and so are apples, *but*—

Thousands of little boys and girls are rushed off to school hungry every morning—with a kiss and/or an apple or bun—because insufficient time was allowed for the child's morning meal.

NOURISH THE SAPLING TO MAKE STRONG THE TREE
"WHAT THE CHILD IS, THE MAN WILL BE"

BREAKFAST, which should form an important foundation for the growing child's eager activities, frequently is a mere snack, hurriedly gulped, so that many a child goes to school half-starved. How can a hungry child learn his lessons?

In behalf of tired mothers, it must be said that the long cooking of ordinary cereals is a drudgery, especially if there also be smaller children who break her rest during the night and clamor for attention before dawn. In most cases, the older members of the family lose out at breakfast time not because the mother is lazy or inconsiderate, but simply because she is exhausted and requires extra rest.

A happy solution of the breakfast problem, one that may even hold the home together during such troublous times, who knows, is PABLUM.

PABLUM banishes over-night and early-morning cereal drudgery, so that mothers can get their deserved rest. At the same time, all members of the family, including the school children, are assured of a quick *nourishing* breakfast.

To prepare PABLUM, simply add milk or water of any temperature, and serve with cream, salt and sugar. If preceded by orange or tomato juice and followed by a glass of milk, and a capsule of Mead's Viosterol in Halibut Liver Oil, such a breakfast fulfills every nutritional requirement: **Protein✓ Fat✓ Carbohydrate✓ Vitamins: A, B, C, D, E, G✓✓ Minerals: Calcium, Phosphorus, Iron, Copper, Etc., Etc.✓✓ Calories✓**

Pablum (Mead's Cereal cooked) is a palatable cereal consisting of wheatmeal, oatmeal, cornmeal, wheat embryo, alfalfa leaf, beef bone, brewers' yeast, iron salt, and sodium chloride.

play in the development of complications and disability in later years. It is interesting to note that 3,289 cases of smallpox were reported in this group of older children. Since this disease is so readily preventable, it is unfortunate that so many cases should occur. The intensive attack that has been directed against diphtheria is reflected in the favorable results shown in the morbidity and mortality records for this disease. Tuberculosis, whooping cough and diphtheria may be credited with destroying the greatest number of these young lives and measles and whooping cough are unquestionably factors of great importance in the development of tuberculosis in the decade which follows.

These tables deserve careful study by all individuals who are interested in child hygiene and the careful application of the facts indicated should result in the prevention of many cases and deaths from these epidemic diseases.

Stop "Bullet in Flight," Says Federal Food and Drug Bureau.—Seizure of poisonous, decomposed or filthy foods is like stopping a murderer's bullet in flight. In his annual report, W. G. Campbell, chief of the Food and Drug Administration, quotes this sharp sentence from an "informed commentator."

He continues, saying seizure has been criticized as only a worthless gesture that may be compared with the arrest of a murderer's revolver after it has slain its victim. Mr. Campbell does not agree. He says it is better to protect the public health by seizing and destroying dangerous food and drugs before they can cause injury than it is to prosecute after the damage is done. Seizure is the prompt and effective method which is the first reliance of the Food and Drug Administration.

Mr. Campbell reports that for the year under review, which ended June 30, 1935, there was a definite increase in the number of seizures and prosecutions. In the course of the year there were 2,011 seizures and 1,029 prosecutions, each of these figures running slightly ahead of the 1934 record. More than 60,000 samples were collected and examined, not by indiscriminate sampling, but as the result of carefully planned procedure which is applied in all inspection districts. Examinations of imported foods and drugs took about one-sixth of the time of the food and drug workers. At the same time, and without relaxing activity in policing the food and drug channels, a program was initiated for training the additional personnel authorized by an increased appropriation for the enforcement of the Food and Drugs Act.

Trade Discounts

The Food and Drug Administration continued to devote some attention to alcoholic beverages, including medicinal whiskies, but made only sixteen seizures in the course of the year, leaving most of the work of supervision to the Federal Alcohol Control Administration.

Health Menaces Come First.—As in previous years, the Food and Drug Administration classified food and drug violations into three principal groups and made a rough division of the time and effort to be devoted to each group of offenses. "The suppression of practices constituting menaces to public health requires first attention," says Mr. Campbell. "Next in importance are adulterations involving the contamination of foods with filth or by decomposition. Numerically, however, those violations which involve economic cheats are in the majority." As in previous years, it has not been possible to devote as much attention to the third class of offenses as might seem desirable because the need for enforcement of health and sanitary safeguards is obviously even more necessary.

Spray-residue inspections have been and will probably continue to be the most important single regulatory activity. This takes more time than any other single effort. . . .

Old Stock Drugs.—An unusual development of the year reflected disturbed economic conditions. Unscrupulous drug dealers were more active than ever before in "salvage" and "distressed merchandise" transactions, and would take in trade and try to work off in sales old and deteriorated products. Seizures of this type of goods resulted in discoveries of products that have been on the shelves since before the Food and Drug Act was enacted. These unscrupulous brokers were particularly active in Texas, and the state authorities coöperating with the Food and Drug Administration seized and destroyed twenty-eight tons of these dangerous old stocks.

Fine Tests Catch Adepts.—In the early days of food and drug enforcement, gross violations were easy to de-

tect even without delicate tests. Now the few manufacturers who try to cheat are more adept, and the Administration is often forced to engage in intricate research in order to make sure of tests which will stand up in the courts. Perfection of tests for minute quantities of lead in foods has enabled the chemists to detect lead in imported sardines which comes from the solder used in sealing the can. They also find lead in tea that is marketed in lead foil. As a result canners and packers are forced to revise their methods and to pack foods safely.

The supervision of anesthetics—ether and chloroform—continued, and the quality has been improved so greatly that few seizures were required.

The report includes a review of a number of the more important court cases decided during the year. Fines ranged from one cent to as high as $4,500. The report also includes brief sections on the enforcement of the laws other than the Food and Drug Act for which the Food and Drug Administration is responsible. These include the Insecticide Act, the Caustic Poison Act, the Import Milk Act, the Naval Stores Act, and the certification of coal-tar colors. As usual the Food and Drug Administration made many tests for the various purchasing agencies in other branches of the Government.

Nicotin Poisoning.—Genkin and his associates made studies on fifty-five workers (forty-one men and fourteen women), who extracted nicotin and nicotin sulphate from tobacco leaves and some of whom developed symptoms of acute poisoning. The pathologic manifestations developing under the influence of repeated small doses of nicotin belong chiefly to the sphere of the vegetative nervous system. Many of the symptoms are manifestations of the irritation of the parasympathetic, such as bradycardia, arrhythmia, hyperacidity, spasms of the smooth muscles, excessive salivation, and sweating. Another group of symptoms indicates disturbances in the sympathetic. To this group belong vascular manifestations of an angio-

spastic character in the lower extremities, tremor, and so on. General cerebral symptoms are the result of disturbances in the blood perfusion of the brain. Symptoms such as sleep disturbances, loss of memory and neurotic manifestations are caused by the direct toxic action of the nicotin on the central nervous system. The most frequent symptom, and thus the one that is most important for the diagnosis of nicotin poisoning, is bradycardia. It may appear also outside the acute intoxications. The authors think that it is not so much the result of a central action of the toxin as of the influence the toxin exerts on the nerve cells of the vagus (in the system of the intracardial ganglions). The pupillary reactions, likewise, seem to have diagnostic significance. The authors observed in a considerable number of their patients either contraction of the pupils or a slowness of reaction.

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS
MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

Therapy of Insect Stings.—Flury, in discussing treatment, points out that the mechanical removal of the venom by suction is impossible in the case of insect stings. Surgical procedures are rarely necessary, except in case of edema of the glottis. In the case of bee stings the removal of the sting is important. Another therapeutic measure is the neutralization of the toxin. This measure is based on the erroneous belief that formic acid is involved in the action of insect venom, but, in spite of this, the frequently employed ammonia is not entirely ineffective. Other substances that formerly were thought to be neutralizing agents, such as sodium bicarbonate, lime water, magnesium oxid and magnesia magma, are sometimes beneficial because they counteract the tension. Some measures are employed to make the venom insoluble. In this connection the author mentions one of the oldest remedies, namely, sodium chlorid, which is dampened and applied or rubbed in. Other substances belonging to this group are magnesium sulphate, ammonium sulphate, some alcoholic preparations, tannic acid, plant juices that contain tannin and certain heavy metals. The author thinks that the use of heat likewise produces coagulation of the venom. He points out that frequently attempts are made to "burn out" insect stings. Tincture of iodin, compound solution of iodin, chlorin water, surgical solution of chlorinated soda and similar preparations aim at a chemical destruction of the venom. Potassium permanganate, likewise, is used much. To counteract the pain, local anesthetics may be employed and the itching may be counteracted by anti-inflammatory agents, such as the phenols and the volatile oils. As a prophylactic measure it is advisable to disinfect the wound with iodin, formaldehyd, or a phenol preparation. The author thinks that most fatalities which occur in connection with insect stings are the result of bacterial infections rather than of the insect venom. The general treatment varies in the different cases. Stings into the blood vessels may produce severe symptoms that resemble anaphylactic shock. To counteract allergic conditions, epinephrin and intravenous calcium therapy have been recommended.—*Medizinische Klinik.*

FACTS and FIGURES - - -

Almost any salesman with a sharp pencil can show with figures that you can, to your financial advantage, disregard established trade marks and reputations for quality and integrity.

But the facts are that those institutions which have through the years continued to respect quality and integrity have, in like manner, continued to enjoy the respect of thinking and discriminating patrons.

LOS ANGELES SAN DIEGO PHOENIX LONG BEACH SANTA ANA

Prostitution in Japan. — The unlicensed prostitutes throughout the country who were arrested in 1933 on the charge of being a social menace numbered 6,642, and numerous others escaped arrest. Of these, 6,374 were examined and 223 were found to be suffering from syphilis, 903 from gonorrhea, 209 from soft chancre, and 134 from other venereal diseases. Of the licensed prostitutes, 49,302 were distributed among 509 licensed quarters, under the charge of 10,281 brothel keepers. The number of pleasure seekers who visited those prostitutes in 1933 was 24,922,504, a great increase as compared with previous years. The "geisha girls," who play the part of bar-maid, singer, waitress and sometimes prostitute if required, though unlicensed, numbered 74,200 throughout the country in 1933. Their numbers are decreasing considerably, owing to the rapid increase of waitresses, but they are more or less a source of venereal diseases.

While the abolition of licensed prostitutes will be carried out in the near future, as declared by the government, the prevention of venereal diseases will remain a great social problem, in view of the unlicensed prostitutes. The delay in abolishing the licensed prostitute is due in part to this problem of the unlicensed prostitute.—*Journal of the American Medical Association.*

Acute Rheumatism and Its Results.—Wilkinson states that rheumatic inflammation, whenever it appears, produces a characteristic microscopic lesion—the submiliary focus. It is common in cardiac muscle, pericardium, endocardium, synovial and subcutaneous tissues, and is found in the adventitia and media of arteries in all parts of the body. The typical focus shows four distinct points in its structure: a fibrinous matrix, certain large multinucleated cells, plasma cells or fibroblasts and an aggregation of leukocytes—darkly staining mononuclear cells. At first the nodule shows an aggregation of lymphocytes and plasma cells, later the characteristic multinucleated cells appear, and finally the lesion is replaced by a patch of fibrous tissue. These foci are always accompanied by more or less marked changes in the parenchyma of the tissue invaded and produce a considerable degree of vascular proliferation and hyperemia. In the more chronic forms of acute rheumatism the degree of fibrosis of the myocardium may be truly astonishing. It is of the greatest importance to realize that even in the mildest case in which the myocardium is involved the endocardium may escape; when it is damaged, with consequent valvular defect, the lesson is preceded by changes in the valve leaflets, and the valves are not directly infected from the blood in the chambers of the heart. The mitral valve is most frequently, and the aortic valve quite commonly, damaged, while the tricuspid and pulmonary valves are relatively seldom attacked. Damage is the result of both stresses and vascularity. The relatively avascular pulmonary valves, which sustain comparatively little stress, escape, while the vascular and heavily stressed mitral valve is most seriously and most often involved. Newman has calculated that 0.8 per cent of all elementary school children have rheumatic cardiac disease. Coombes showed that about 40 per cent of all heart disease was rheumatic, that the average rheumatic cardiac patient lived to twenty-eight and one-half years and that only 7 per cent of such patients attained the age of fifty. He also showed that nearly half the children who acquire rheumatism before the age of five years develop serious cardiac damage, while only a fourth of those who develop rheumatism after ten years of age become cardiac patients.—*British Medical Journal.*

Now and then one has to wrest the truth from a book; sometimes one must become a detective to read well. Be not always satisfied with the first gleaning of an author's meaning; great books especially must be read again and again if one is to uncover their deepest veins of thought. Reflect on what you read, recall from time to time the subject-matter of books that seem to you especially significant, discuss their import, be critical, and draw conclusions. So will you bring the ideas and emotions of writers to bear upon your problem and your life; so will you develop understanding and creative power.—Leon J. Richardson.

Remove the blindfold

with a written prescription for the genuine Abbott's Haliver Oil with Viosterol . . .

● Products supplying Vitamins A and D vary in potency. And, since no quick, simple test for vitamin potency exists, patients should not be permitted to buy blindly. They need the physician's competent guidance in making this sort of purchases.

One way to see that your patients receive a carefully assayed product is to write your prescriptions for Haliver Oil with Viosterol —and to specify *Abbott.* Three or more rigid assays (colorimetric, spectroscopic and biologic) establish the Vitamin A potency, and a bio-assay the Vitamin D content of each lot of Abbott's Haliver Oil with Viosterol. Moreover, samples of representative lots are kept to be bio-assayed at regular intervals. The entire production of Abbott's Haliver Oil is in Abbott's own complete control—further assurance of high quality in the product.

● Prescribe Abbott's Haliver Oil with Viosterol* with full confidence in its potency whenever Vitamins A and D are indicated. ABBOTT LABORATORIES, North Chicago, Ill.

ELI LILLY AND COMPANY

FOUNDED 1876

Makers of Medicinal Products

Widespread clinical application has demonstrated the effectiveness of Merthiolate as a first-aid antiseptic. It is admirably suited for use in many surgical fields.† Merthiolate (sodium ethyl mercuri thiosalicylate, Lilly) is an organic mercurial compound. For special application in medicine and surgery, Merthiolate is incorporated in a colored alcohol-acetone-aqueous tincture, in an ointment base, in a water-soluble jelly, and in a modified greaseless cream. Salient points:

1. High germicidal activity. 2. Rapidity of disinfection. 3. Sustained action. 4. Tissue compatibility

EDITORIALS[†]

ANNUAL SESSION OF 1936: HEADQUARTERS AT HOTEL CORONADO

Hotel Reservations at This Year's Annual Session.—The 1936 annual session of the California Medical Association will have as its headquarters the historic and ever-attractive Hotel del Coronado, and it should not be a surprise to members who have not made reservations to date to learn that only twenty-five rooms are still at their disposal. This means that many members who attend the coming session will be obliged to seek hotel accommodations in San Diego, across the bay, and orders for even these should not be too long delayed. A letter to Association Secretary Warnshuis will bring you a list of hotels.

* * *

Scientific Program.—The Committee on Scientific Program at a recent meeting in Los Angeles reported that the programs for the general meetings and also the numerous sections were well in hand; the chief worry being, not as to sufficient addresses or the attendance, but rather whether the accommodations for meetings would be adequate comfortably to care for members who may wish to attend the sections and hear the presentations of guest speakers or essayists.

With the yearly growth of the State Association, the group of members who offer papers for the scientific programs becomes greater, and, as a consequence, the Committee on Scientific Program for some time past has been forced to decline a considerable number of excellent essays because each section is permitted to have only a certain amount of time, that all the various activities may properly fit, one into the other. Members, therefore, who have in mind papers which they think worthy of consideration, as of interest and value to other members, should write practically a year ahead to the Association Secretary who, as chairman of the Committee on Scientific Program, will be glad to give full information on the requirements and standards laid down for such scientific contributions.

* * *

The Coronado Session Dates Are May 25-28, 1936.—It is suggested that you mark your calendar with these dates and make a mental re-solve to try to attend the meetings of this year. Many subjects of importance in relation to both scientific and organized medicine will be up for consideration. Those who attend annual session meetings always feel they profit, not only from hearing papers and discussions, but also from the pleasant contacts made with colleagues from all parts of the State. The meetings, too, are of value to all members, no matter how long they have been in practice or what is the period of their California Medical Association membership, and a cordial invitation is extended to every member to attend. Try, therefore, to be among those who will answer "Present" at Coronado on May 25-28.

[†] Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comments column, which follows.

EXPERT MEDICAL TESTIMONY: A RECENT LEGAL ENCOUNTER

Claims of a Los Angeles Attorney.—In December last, a member of the Los Angeles County Medical Association was served with a court subpoena to appear with certain records and give a deposition on his professional findings concerning a patient who had been under his observation. He learned that the attorney for the plaintiff intended to demand expert testimony, without giving him the fee for such testimony; client and lawyer contending that, under Section 2021 of the Civil Code of California, a new code provision passed by the last legislature, the physician was so obligated. Upon the advice of his personal attorney, he stated his objections to being questioned; but in order to avoid the delays incident to a citation for contempt of court, he gave his testimony on the questions submitted, all subject, however, to his objections thereto.

When our attention was called to the matter, we wrote to the general counsel of the Association, Mr. Hartley Peart, and his letter of reply may be found on page 136 of this issue.

Mention is here made of the affair lest further demands of this nature be presented to members of the Association. All that is needed to bring such "demanding attorneys" to their senses is the willingness of one of the physicians so cited to refuse to answer on matters of opinion and permit himself to be haled before a superior court on the charge of contempt; after which the matter can be threshed out and settled.

Between attorneys-at-law in the legislature, who elaborate confusing statutes, and others in private practice, who seek to add more confusion, ordinary citizens are certainly, at times, submitted to much inconvenience in combating such nuisances.

ON SOME ARTICLES AND ITEMS IN THE CURRENT NUMBER

Every Issue Contains Some Articles of Special Interest.—In each number of the official Journal an effort is made to present a composite of the California Medical Association's scientific and organization activities in the hope that every reader may find something to his special liking or needs. When, occasionally, attention is called to certain articles, it is not so much because of supposedly superior scientific or literary merit, but rather that the articles mentioned, on account of other reasons existing at the time, may be of immediate or general interest and importance. Thus, in the current issue, mention may be made of the items listed below:

* * *

Infection of Two Laboratory Workers in California with Psittacosis and Tularemia.—From time to time, reports of cases of infection of laboratory workers find places in the literature,* and to these may be added two case reports in this issue; one of psittacosis and the other of tularemia, well worthy of perusal. It is gratifying to know that both patients went on to good recovery in spite of the severe illness each experienced. In this connection, also, may be noted the unfortunate experience of Dr. H. E. Hasseltine of the United States Public Health Service, who contracted psittacosis in the recent work of dismantling the Pasadena laboratory of the State Board of Health; but who, likewise, after a critical sickness, happily recovered.

* * *

"Baking Soda-Sodium Fluorid" Poisonings in San Francisco.—A few weeks ago the lay press contained, day after day, accounts of the illness and deaths resulting from the use of what was supposed to be poisoned baking soda, but which later was shown to be baking soda contaminated by sodium fluorid. After immediate and exhaustive investigation by the Director of Public Health of the City and County of San Francisco, the conditions under which this accident occurred were laid bare. The two articles, one entitled "Poisoning Due to the Ingestion of a Mixture of Sodium Bicarbonate-Sodium Fluorid," by Dr. J. C. Geiger, and the other captioned "Acute Fluorin Poisoning," by Dr. Jesse L. Carr, commenting on the need of more efficient statutory regulations of salvaged goods, make interesting reading. It is, therefore, to be hoped that both State and local regulations, adequate to prevent a recurrence of such accidents, will be enacted in the near future.

* * *

Conference of County Society Secretaries.—On Saturday, January 18, the secretaries of the component county societies were the official guests of the California Medical Association in an all-day meeting held in San Francisco. The program was printed in last month's issue (page 52), and Association Secretary Warnshuis will no doubt present further information thereon. The officers of the State Association felt that this conference, in its initial meeting, had more than justified itself; a sentiment heartily concurred in by the representatives of the county societies who were present.

It is generally agreed that the administrative officer of a county society who carries most of its burdens is the secretary. If the county secretary is familiar with the organization work of the State Association, he can become a powerful factor in creating additional and harmonious effort for the attainment of the policies to which the parent organization is pledged. At San Francisco, on Saturday morning, the State Association officers presented outlines of their work and problems. In the afternoon, round-table discussions were had of the work of the Association and its component societies. Many of these secretaries will be among the delegates at the next annual session, and this preliminary conference will make for better understanding of the numerous subjects which will be presented to the House of Delegates at Coronado.

---

* See October, 1935, CALIFORNIA AND WESTERN MEDICINE, page 260 (Doctor Hasseltine); and January, 1936, issue, page 64 (the late Miss Pabst).

* * *

California Medical Association Council Meeting of January 19.—The Council put in an entire day discussing items on an extensive docket and even then found it difficult adequately to consider all the problems submitted. The complete minutes are printed in this issue.[†]

One of the important matters was the report of the Judicial Council of the American Medical Association on the appeal of two members of the Los Angeles County Medical Association who, some time ago, were expelled by that unit. An inspection of the blackface subheadings of the other items of business will reveal decisions taken on other problems facing the Association. Members are urged to read the minutes, recollecting that the references to subjects are much condensed when written up as minutes. Local councilors and the Association Secretary will be happy to give additional information to members who desire further knowledge on any topics.

STATE ASSOCIATION DELEGATES: HOW ONE LARGE SOCIETY SELECTS ITS DELEGATES AND ALTERNATES

House of Delegates the Association's Supreme Body: Its Important Work.—The increasing importance of the medical-economic problems which, at each year's annual session come before the House of Delegates, makes it more than ever apparent that the election of delegates and alternates should not be a haphazard function, but rather a duty to be looked upon as one of the serious responsibilities of a component county society, and so to be construed by all members. The offices of delegates and alternates should not be regarded as positions of little moment, to be given as transient expressions of courtesy to one member this year, and to another the next. On the contrary, a county unit's members, prior to electing their delegates and alternates should ask themselves: Who, among our number, can best represent the points of view of our society on the business problems of the State Association and its component county units, and who, among us, may be of greatest coöperative service with other delegates in acting on policies vital to the further development of both our Association and scientific and organized medicine?

In smaller societies the overemphasizing of personal regard or other affiliations may, at times, lead to danger and prove not always to result in the best of possible selections. In larger organizations with hundreds of members—many of whom, month in and month out, pay only nominal attention to the general problems of their organization—the task of selection is also no easy matter.

* * *

How the Los Angeles County Medical Association Has Solved This Problem.—The Los Angeles County Medical Association has more than 2,200 members and is entitled, therefore, on the basis of one delegate for every fifty members, to forty-one delegates. Its task is to determine who shall be its forty-one delegates and alternates.

In 1933, the Board of Councilors of that society solved its problem, not through the appointment of a nominating committee, nor even by open-floor nominations, but by a plan of impersonal selection of nominees from a list of state and county officers, who, as such, are familiar with the problems of organized medicine; additional nominations from the floor also being in order. Ballots are previously prepared, containing the list of state and county officers, and with blanks for additional names. The election, therefore, takes but little time; the tellers collecting the ballots and submitting their report before the end of the meeting. The plan is mentioned for its obvious advantages, and because it may have a suggestive value to other county societies wishing to adopt, by resolution, a similar or modified plan as their own future method of procedure. The ballot sheets give the names of holdover delegates so that these are not voted upon. The full number of delegates to which the society is entitled, is voted for; the highest half so elected to act as delegates for two years, the succeeding half to act as alternates. Some of the county societies, even though they have elected their delegates for this year's session, may at this time wish to consider the plan, and then adopt it, or a modification, for use during the next and succeeding years.

From the introductory sheet of the recent Los Angeles ballot the following explanatory excerpts are taken:

> Vote for forty-one (41), the twenty (20) highest to be declared elected delegates for 1936 and 1937, the next twenty-one (21) to be declared elected alternates for 1936 and 1937.
>
> ♦ ♦ ♦
>
> The attached ballot, with nominees for delegates and alternates, was prepared in conformity with Minute No. 687, proceedings of the Board of Councilors, January 8, 1933, which provides that nominees be selected from the following groups:
>
> 1. All members of the Los Angeles County Medical Association who are members of any of the California Medical Association committees.
> 2. All members of the Board of Councilors not already elected to the House of Delegates.
> 3. All committee chairmen of the Los Angeles County Medical Association not already elected delegates.

[†] See page 120.

4. All alternates who have attended two State meetings.
5. All alternates who have attended one State meeting, and have given valid excuse to the secretary for their absence from the second meeting.

On the attached ballot the names of the above nominees are listed in alphabetical order for your convenience. (Additional nominations may be made from the floor.) After each name the following symbols are used to indicate from what list, in accordance with Minute No. 687, the nominee was selected.

C. M. A.—State Association Committee member.

Ch.—Chairman of a County Medical Association committee.

B. C.—Member of the Board of Councilors not now serving as delegate or alternate.

Alt.—Alternate who has attended two State meetings, or who has attended one State meeting and given valid excuse for not attending the second.

EXPULSION FROM MEMBERSHIP: RULING IN A RECENT CALIFORNIA CASE BY THE JUDICIAL COUNCIL OF THE A. M. A.

Los Angeles County Medical Association's Errors in Technical Procedures Bring Reversal of Judgment.—Some time ago, the Los Angeles County Medical Association, through its Board of Councilors, expelled from membership two of the members of that component county society. The members so expelled filed an appeal to the California Medical Association, and the Council of that Association, after several hearings in which legal proceedings were carefully observed, affirmed the action of the Los Angeles County Medical Association.

The expelled members then appealed to the Judicial Council of the American Medical Association, and at the last annual session at Atlantic City, June 10-14, 1935, that body held a hearing on the appeal. The Judicial Council's decision was received by the California Medical Association two days before the California Medical Association Council meeting of January 19, 1936, held in San Francisco, and is given in full on page 120 of this issue.

The attention of all members is called thereto and the lesson to be taken to heart: the importance of being meticulously careful in all disciplinary procedures; since the nonobservance of by-laws of the State Association on method of procedure (with which the by-laws also of component county societies must conform), may lead to the reversal of judgments on technical grounds by the higher constituted bodies in organized medicine, as in the case at issue.

* * *

California Medical Association Is Studying a New Code of Disciplinary Procedure.—The Council of the California Medical Association, through a special committee, is now studying a revised code of disciplinary procedure, which will be submitted to the House of Delegates at the Coronado annual session (May 25-28, 1936), in the belief that its adoption and use will reduce to a negligible minimum the possibilities of reversal on actions previously taken.

MEDICAL AND PUBLIC HEALTH EXHIBITS AT THE 1936 SAN DIEGO FAIR: "C. M. A. DAY" ON MAY 26

San Diego Reopens Its Fair on February 12. San Diego's Fair of 1935, through its beautiful settings and splendid exhibits made for itself a warm place in the hearts and minds of all who were fortunate enough to visit it. As a consequence, the attractive buildings in Balboa Park, instead of being demolished will be utilized for continuing the Fair in 1936, the buildings with displays being opened to visitors on February 12.

One of the structures, excellently built and located, has been set aside as the Palace of Medical Science, and in it will be placed some of the best exhibits on public health, and on preventive and curative medicine that have been shown anywhere. Members of the Association who were not able to visit the San Diego Fair last year will find in the Fair of 1936 an additional reason for attending the California Medical Association annual session at San Diego, its second meeting day, (Tuesday, May 26), having been designated as "California Medical Association Day." An announcement concerning the public health and medical exhibits which has just come to hand, gives the following additional information:

Tuesday, May 26, has been designated as California Medical Association Day at the 1936 California Pacific International Exposition, San Diego, which opens February 12 and will continue to September 9.

Approximately 3,000 physicians and their families are expected to visit the world's fair in Balboa Park upon that occasion.

Focal point of the conclave will be the Palace of Medical Science, one of the principal exhibit palaces of the 1936 exposition, where extensive displays will be sponsored by the leading medical societies and manufacturers of pharmaceutical supplies.

A program appropriate to the day is being arranged by an exposition committee of the San Diego County Medical Society, with Dr. Lyell C. Kinney, 1831 Fourth Avenue, San Diego, acting as chairman. Direct coöperation is being lent by Dr. Ben F. Eager, Medico-Dental Building, San Diego, president, and Dr. W. C. Crabtree, Medico-Dental Building, San Diego, secretary of the San Diego County Medical Society.

A medical exhibit in the Palace of Medical Science will be sponsored by the San Diego County Medical Society, with the coöperation of the California Medical Association and the American Medical Association. Dr. W. H. Geistweit, Jr., of San Diego, has been named director of medical exhibits to arrange details of this exhibit.

The committee of the San Diego County Medical Society includes Doctors Kinney (chairman), J. F. Churchill, W. W. Crawford, T. O. Burger, M. C. Harding, Alex Lesem, B. Eager, and W. C. Crabtree.

The exposition committee of the California Medical Association is composed of Doctors C. G. Toland (chairman), E. M. Pallette, W. W. Roblee, J. C. Ruddock, C. O. Tanner, Robert A. Peers, Fred Clarke, and F. C. Warnshuis.

About 1,300 square feet of space will be occupied by the American Medical Association exhibit, which will be installed under direction of a representative sent to the world's fair from Chicago.

A large space will be occupied by the Chicago Roentgen Club, and x-ray films and pathological specimens will be exhibited by the Southern California Pathologists' Association.

The California State Board of Health, in coöperation with the Hooper Foundation for Medical Research of the University of California, will be represented by a joint display.

An exhibit showing some of the work of the Board of Medical Examiners of the State of California will have a place in the building.

Los Angeles City and County Health Department will present a diphtheria prevention demonstration, and the Automobile Club of Southern California will install a safety exhibit.

Demonstrations of proper feeding of infants will be shown by the West Nursing Bureau and the Southwestern Pediatric Society, and the Pacific Coast Obstetrical Society will also participate.

Combined forces of the California Dairy Council and the Arbitration Board of the San Diego County dairy industry, under direction of Douglas Young and Wilbur Thomas, will present an exhibit, and the San Diego City and County Health Department, will coöperate under the direction of Dr. Alex Lesem, city and county health officer. Nurses, headed by Miss Ilma Lucas, nutritionist of the California Dairy Council, will act as hostesses.

In addition to the educational exhibits there will be lectures and daily presentations of motion pictures on medical subjects interesting to the general public.

The American College of Surgeons has offered to coöperate by sending speakers to the Palace of Medical Science during the exposition. During the school vacations, special motion pictures on health subjects, designed to appeal primarily to children, will be added to the programs.

Commercial displays of prominent pharmaceutical establishments and manufacturers of medical supplies also will be housed in the medical building. One of the first to be installed will be that of the General Electric X-Ray Corporation of Chicago.

It is predicted that the medical exhibits at the 1936 exposition will be the most extensive yet displayed, and will equal or surpass that at Chicago's Century of Progress expositions. The whole Palace of Medical Science will be devoted solely to exhibits treating on the prevention and treatment of disease, and it will form one of the important features of this world's fair, which is dedicated to mankind's progress in all realms of science, art, and industry.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 116.

EDITORIAL COMMENT[†]

DINITROPHENOL AND REDUCING

Much time has been devoted by medical science to a study of fat metabolism and to a solution of the problems concerned in the origin, pathogenesis and treatment of overweight. Practitioners of medicine are forced into daily consideration of the same problems through the frequency with which they are consulted regarding the reduction of weight. Much of their effort, however, has perforce been spent in an attempt to teach the fallacy of the many fads, "cures" and short-cuts so widely advertised for the relief of the condition. The advent of dinitrophenol, it was hoped, would do much to simplify the whole problem.

A review of some 290 cases from the literature, in which dinitrophenol has been administered, seems to warrant several rather definite conclusions. First, the loss of weight under diet and dinitrophenol is not strikingly greater than under diet alone. Secondly, distressing symptoms are commonly attendant upon its use. Thirdly, the toxic effects of the drug upon body function and tissue cannot be denied. Fourthly, the reported deaths from dinitrophenol administration in accepted therapeutic dosages make it hard to justify its widespread application in the relatively benign condition of overweight. Let us, therefore, consider these points seriatim.

Loss of Weight.—Of the 290 patients mentioned, 276 showed loss of weight. In some instances, no loss or actual gain has been reported.[1-5] The burden of evidence shows the undoubted ability of the drug to cause loss of weight, although the mechanisms through which this is accomplished are not thoroughly understood. Bayer and Gray[1] and Strang and Evans[6] have carefully compared the rate of weight loss with and without the drug in their series of cases. The former find weight loss accelerated by the use of dinitrophenol to a greater extent than by thyroid substance. While Strang and Evans observe greater losses of weight in the cases receiving dinitrophenol than in those treated by diet alone, they feel the difference is hardly striking enough to offset the discomfort and possible damage the drug may do. Moreover, very little has been reported as to the behavior of patients subsequent to discontinuance of the drug, while still under dietary regulation.

Distressing Symptoms.—Among the distressing symptoms, one must give prominence to sensations of heat, marked sense of warmth, flushing of the skin, and profuse sweating, all of which may be looked upon as "physiologic" responses to the medication. These manifestations occurred to a greater or lesser extent in the 290 patients above mentioned. In the same groups, some type of skin condition was noted in sixty-eight individuals. This was usually an urticarial or maculopapular eruption, commonly accompanied by intense itching, and at times associated with bleb formation. Commonly reported symptoms were fever, hyperpnea, dyspnea, general malaise, tiredness, exhaustion, dizziness, faintness, headaches, and paraesthesias, at times going on to true neuritis; and pains in various parts of the body, particularly in the calves of the legs, back, and epigastrium.

[†] This department of California and Western Medicine presents editorial comment by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California and Nevada Medical Associations to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

Less commonly observed were palpitation, anxiety, restlessness, anorexia, sore throat, delirium, and coma. Sore throat and swollen neck glands were found in two instances, with "malignant" neutropenia.

Toxic Effects. — A very good review of the toxic effects of dinitrophenol upon function and tissue has been made by MacBryde and Taussig,[7] who have added some experimental results of their own. Among their conclusions we find: "Dinitrophenol in small doses caused functional changes indicative of toxicity in liver, heart and muscles, in a large percentage of patients in whom no special idiosyncrasy was noted. It also produced a loss of dextrose tolerance." If one carefully scans the effects of dinitrophenol on carbohydrate and fat metabolism, one is led to ponder upon the probability of permanent disturbances in both function and tissue subsequent to withdrawal of the drug.

Reported Deaths.—Seven of the 290 cases, of which we have spoken, eventuated in death; of these patients five received amounts of the drug well within the recommended therapeutic dosage.

Finally, experiences with dinitrophenol should emphasize the fact that "there is no royal road to reduction." Jones[8] has well stated that people grow fat because of an excess of intake over output. It would seem that diet should still remain the fundamental keystone in the management of the overweight and obese patient: it should be supplemented by medication only as the individual case may require it.

San Francisco.

THE GENERAL PRACTITIONER AND PROSTATIC SURGERY

During the past four years volumes have been written in medical journals, and much has been written and said among the lay persons regarding the electrical, or "new" operation for enlarged prostates. Much of this literature is conflicting, and much of it is misleading, particularly that circulated among the laity. The old maxim, "a little knowledge is dangerous," is exemplified more vividly by the patients who think that they know about their illness or methods of treatment and surgical procedures. It is, therefore, not unusual to have a patient come to a physician with a preconceived idea of his ailment and the treatment indicated. With the proper explanation, the average intelligent patient can be convinced of the fallacy of his opinion, and the physician is permitted to work unhampered.

Much worse than the erroneous opinions of the patient are the erroneous ideas of the physician himself on subjects of which he can of necessity not be thoroughly informed. I refer here to the subject of the treatment of prostatic hypertrophy. The physician who does not do genito-urinary surgery is not expected to keep completely informed of the details of the developments in urologic work. As stated before, the medical literature on the subject of treatment of prostatic hypertrophy has been so voluminous and conflicting that a perusal of the same would leave one somewhat confused. It is only the person who actually does the work, and is familiar with the disadvantages as well as the advantages of the various procedures, who can properly evaluate what he reads.

Further, the present status of the treatment of prostatic hypertrophy is sufficiently flexible to allow for several acceptable and desirable surgical procedures. The particular procedure to be selected for the case under consideration is determined by several factors, namely, the patient's general condition, associated urologic pathology, type of prostatic enlargement and, even at times, the patient's social status and future requirements. In order to determine the above factors, one must necessarily do a complete urologic examination. It is, therefore, apparent that the general practitioner who originally sees the patient and makes the diagnosis of prostatic obstruction is not in a position to make final recommendations as to the procedure indicated in the particular case. When the patient is told that he has an enlarged prostate that will probably require surgery, he frequently asks if he can be treated by the "new electrical method." Many prostatic patients have heard of others who have been operated in that way and, therefore, assume that they are eligible to the same procedure in contradistinction to the "old cutting operation." The patients have an impression that this is a simple procedure, with no risk attached to it and complete cure in every case. This is true in a large percentage of cases, but is, unfortunately, not true in every case. The attending physician is prone to promise the patient this new operation and to refer him to the urologist with that in mind. When the urologist completes his examination and tells the patient that he finds the resection to be undesirable, it is then very difficult to convince the patient of the need of the "cutting operation."

It would seem permissible, therefore, to make a plea to the referring physicians to leave the matter of choice of procedure to the urologist who will do the surgery. A large per cent of prostatic hypertrophies can be properly treated by resection, so one is justified, where necessary, in telling the patient that resection will probably be the indicated procedure. Many are of the belief that the most desirable method of handling this situation is to explain to the patient that he requires a complete urologic examination in order to determine the particular type of enlargement that he has, and to see if he has any associated pathology before recommending the type of surgery to be employed.

PSITTACOSIS AND TULAREMIA*

REPORT OF CASES—INFECTION OF TWO LABORATORY WORKERS IN CALIFORNIA: RECOVERY

I. REPORT OF CASE: PSITTACOSIS

A LABORATORY worker, who has for four years been intimately exposed to the virus of psittacosis in the form of infected birds belonging to various species, mice and human specimens (sputums and autopsy material), worked on October 6, 1935, with a heavy suspension of L. C. L. bodies (the elementary bodies regularly found in psittacosis) without wearing rubber gloves or face mask. The infective agent had been isolated and concentrated from the chorion-allantoic membrane of several developing chicks artificially inoculated with the virus. It was infective for mice in a dilution of 1.0 by 10^{-8}. On both October 12 and 13, 1935, he felt tired, and at 4:30 p. m. on October 14 he had a definite chill, when his temperature was 39.8 degrees centigrade. During the night a grippe-like general aching was accompanied by a severe pain in the lumbar region. Between 3 and 4 a. m. profuse perspiration gave relief and was followed by sound sleep. During the next four days the temperature invariably rose late in the afternoon to from 39.2 to 39.4 degrees centigrade, accompanied by sensations of chilliness, and then fell to 37 degrees after midnight, followed by perspiration. There was no headache and the night sleep of from six to eight hours was sound, free from dreams, and refreshing. The pulse varied between 76-88 and the respiration was from 10 to 20. Despite the loss of fluid during the attacks of perspiration, thirst was in no way pronounced. There was a moderate anorexia, however, and the digestion and stool were normal. A chronic bronchitis of several months' standing subsided during the first three days of the acute illness, and the absence of coughing or pharyngeal irritation was noteworthy. The nasal mucus, forcibly expelled, was slightly tinged with blood. There was no herpes labialis. On October 16, 1935, the blood examination revealed: hemoglobin, 102; red blood cells, 5,740,000; white blood cells, 5,950; granulocytes, 85 per cent; lymphocytes, 9 per cent; and mononuclears, 6 per cent. Dr. Herbert C. Moffitt examined the patient on October 16 and subsequent days, and recorded the following findings:

"Interesting points in the history were recent laboratory exposures to both psittacosis and tularemia, and a well-known immunity to all forms of Brucella infection. An associate † in the early October work had just entered the University Hospital with high temperature and indefinite pulmonary signs. There was no repetition of the initial chill, although temperature rose rapidly each afternoon for four days. Sweating was profuse for four or five nights, and was followed by rapid drop in temperature and complete relief of malaise and lumbar backache, which was severe for two days. No eruption was seen in mouth or on skin. A cough of three months ceased abruptly with onset of chill and high temperature. On October 21, for the first time tympany was noted over the right back, just inside and below the scapular angle. Cough and deep inspiration caused an explosion of fine crepitant râles, which we have learned to associate with a pneumonic process, beginning in the lower lobe near the hilus and gradually extending toward the periphery. These signs completely disappeared after three days."

Since the pulmonary signs located on October 21 were not followed by coughing, two (one gram) doses of ammonium chlorid were administered. During two coughing spells, a coffeespoonful of brownish-tinged, slightly mucoid sputum was raised on October 22, 1935. Microscopically, it showed streptococci, small and large Gram-negative rods, few Spirochaetes and fusiform organisms. A mouse test for pneumococci was negative. On the blood plates alpha streptococci, influenza and Friedlander's bacilli developed. A broth extract of the sputum inoculated intraperitoneally into mice and a ricebird gave the following results:

Mouse 19382 died on third day. Indefinite lesions.

Mouse 19383 died on seventh day. Typical gross lesions of psittacosis, with L. C. L. findings.

Mouse 19384 killed on ninth day in extremis. Typical lesions. Virus repeatedly passaged through mice and one ricebird.

Mouse 19385 killed on eleventh day. Slight lesions.

Ricebird 476 killed while ill on eleventh day. Slight lesions. Virus passaged.

A second specimen of sputum, definitely blood-tinged, collected on October 24, 1935, at a time when the daily temperature varied between 36.2 and 37 degrees centigrade, presented the same flora. The mouse test for virus was as follows:

Mouse 19390 died on tenth day. Inconclusive, due to spontaneous renal abscess.

Mouse 19391 killed on nineteenth day. Medium-sized spleen.

Mouse 19392 killed on thirty-sixth day. Large spleen, liver necrosis. Splenic suspension, when passaged, fatal to mice in five days.

Mouse 19393 killed on thirty-sixth day. Medium-sized spleen.

Despite the use of ammonium chlorid, no further sputum specimens could be procured. The blood serum collected on November 5, 1935, gave negative agglutination tests with the enteric fever antigens, B. tularense, Brucella abortus and melitensis. The complement fixation test for Brucella abortus was positive in a dilution of 0.05 (the patient is immune to the Brucella types, gives a strong allergic skin test and a phagocytic index of 30). Convalescence was decidedly slow. A general weakness foreign to the patient persisted for weeks. An x-ray film taken on November 14 showed a very faint, hazy density in the lower right lobe.

COMMENT

The observation proves again the customary saying, familiarity breeds contempt, and the general belief that continuous exposures to the virus of psittacosis may lead to a latent immunizing infection is rudely contradicted. In retrospect, it is by no means difficult to trace the disease directly to the careless handling of virus-containing material, which is in all probability far more infectious than the average bird or mice specimens. Darkfield examinations, diverse staining procedures, and the preparation of serial dilutions lend themselves to contamination of the unprotected hands. Furthermore, it is not unlikely that the virus enriched on the chick embryo may acquire new invasive properties. A German bacteriologist, who contracted psittacosis in the ten months of his intensive study of the disease, states that he contracted the infection while passaging the virus through the chicken egg.

The influenza-like character of the attack without headache would have escaped etiologic identification without the examination of the sputum. In fact, this experience lends considerable support to the belief that the mild grippe-like minor illnesses which develop in the occupational groups or households exposed to infected psittacine birds are rudimentary attacks of psittacosis. One naturally would like to know if such an attack leaves an immunity of some sort. Neutralizing antibodies, despite a severe disease, are frequently not demonstrable. The complement-fixation test with the usual mouse-spleen antigen is not very dependable. Perhaps tests with purified elementary bodies may yield more definite information. Finally, one should keep in mind the possibility that the virus which exhibits such a remarkable tendency to latency may remain unrecognized in the body, but may through an intercurrent infection become mobilized. It is, doubtless, unwise to place implicit confidence in the belief that "silent," or even recognized virus infections confer a permanent protection. One must, therefore, continue to maintain appropriate precautionary measures and continuous vigilance against laboratory infections.

---

* Editor's Note.—The case histories here reported are those of two well-known laboratory workers in California, who were infected, respectively, with psittacosis and tularemia. Out of courtesy, names are omitted.

† See report of case of tularemia which follows as Part II of this article.

II. REPORT OF CASE: TULAREMIA

A case of tularemia is reported which is of interest as an infrequent type of involvement, and because of the diagnostic problem presented.

The patient, a laboratory technician in research bacteriology, was first seen on October 15, at which time she gave the following history:

Present Illness.—For the past two and one-half years she has been working with psittacosis and relapsing fever material, and for three weeks prior to onset of her illness her duties had also included the handling of material from tularemia cases. She does not recall any break in technique, pricks of hands or defective apparatus, and has always worn rubber gloves when working with infectious material. It is not unlikely that the pipetting of an uncompletely sterilized suspension of B. tularense on October 7, 1935, furnished the source of infection.

On October 10, the patient had some headache and felt unusually tired. She felt improved the following morning and went to work as usual. In the evening she felt feverish and had general aching, temperature 100.8 degrees Fahrenheit. During the night she perspired rather freely, and again felt sufficiently improved to report at the laboratory the morning of October 12. Had no appetite at noon, and left work in mid-afternoon because of extreme fatigue. Headache returned and temperature rose to 101.6 at 10 p. m. Remained in bed on Sunday, October 13, and Monday, October 14; generalized aching persisting, and with headache increasingly severe and throbbing in character. Temperature rose to a maximum of 102, and transient nausea was noted as well as suboccipital pain and slight neck stiffness.

Illness was reported on October 14, and the patient was brought into the hospital the following morning, at which time she complained of constant, severe headache, generalized, general aching, some photophobia and mental dullness. She stated there had been no chills, cough, sore throat or other respiratory symptoms. No adenopathy, no rash; bowels somewhat sluggish since onset of symptoms.

Family History and Past History.—Not significant.

Physical Examination.—Negative for cause of symptoms; no adenopathy.

Laboratory Findings. — Urine, negative; white blood cells, 7,840; polymorphonuclears, 73 per cent; agglutination positive, 1-20—typhoid and paratyphoid A and B and Brucella abortus; phagocytic index, 3.8; complement fixation Brucella, negative.

X-Ray.—Chest showed heavy root shadows, especially on right, and peribronchial infiltration extending from lower hilum on right to an area of consolidation six centimeters in diameter in upper portion of right lobe.

Physical, laboratory, and x-ray findings continued unchanged for the ensuing five days (except that no further agglutination with Brucella abortus was obtained); temperature meanwhile showing wide swings between normal and 104 degrees Fahrenheit. Subjectively continued to have troublesome headaches and slight nausea, but there were no symptoms referable to the lungs. Marked drops in temperature were associated with rather profuse diaphoresis.

October 21: The white blood corpuscle count rose to 12,750, 69 per cent polymorphonuclears; phagocytic index for Brucella, 16.36.

October 22: White blood corpuscle count was 14,350, 61 per cent polymorphonuclears. Chest examination on this date for the first time revealed moderately fine, moist râles over an area 8 to 10 centimeters in diameter on the right side posteriorly, corresponding in location to consolidation shown in x-rays of October 15 and 18, but apparently larger in extent.

October 23: Chest film showed extension of the consolidation outward and downward, with appearance of softening in the original area; blood count, 13,980; polymorphonuclears, 73 per cent.

October 24: Physical examination revealed dullness and suppressed breath sounds below the original involvement, and râles heard over a wider area than at preceding examinations.

Repeated agglutinations and blood cultures were negative during this interval, except for the above-mentioned positive agglutination in low titer, explained by past and anti-typhoid inoculation. Fever continued high; there was very slight, dry cough; and after administration of ammonium chlorid, a small amount of watery sputum, apparently mainly saliva, was obtained and injected into mice and cultured. Culture showed alpha-streptococcus, Staphylococcus aureus, m. catarrhalis, and Friedlander's bacillus.

Pulmonary involvement with slight leukocytosis, fever and headache, were suggestive of psittacosis in absence of laboratory evidence in favor of other etiology. Increasing involvement and falling white count was considered as indications of low resistance on the part of the patient, and it was deemed desirable to assume the probable etiology as psittacosis and administer convalescent serum. Twenty-five cubic centimeters of a pooled serum obtained from two recovered psittacosis patients was given on October 25, and repeated on the following day. It should be noted that one of the donors had also survived a tularemia infection.

Prompt subjective improvement was noted, and a decided drop in temperature followed the serum administration, with no subsequent rise above 100 degrees Fahrenheit.

Diagnosis was made by:

1. Agglutination test, positive, October 28 for B. tularense 1-640—4 plus, 1-1280—2 plus. November 5, for B. tularense 1-1280—4 plus.
2. Skin test October 28, which was positive October 30, with area of reaction 37 mm., central induration 8 mm.
3. Confirmed by recovery of organism B. tularense, identified by agglutination, from lesions in mice dying five to eight days following injection with sputum obtained from patient on October 25. This organism, passed into guinea-pigs, produced typical lesions of tularemia.

Progressive improvement in general condition, physical findings and x-ray evidence have been noted. Convalescence has been slow, strength returning with the reluctance characteristic of B. tularense infections. X-rays still show considerable thickening and suggest the probability of residual fibrosis, although to date each successive film has showed some improvement.

COMMENT

Of special interest is the absence of cutaneous and lymph-gland lesions and the limitation of involvement to the lungs. Presumably, infection took place by way of the respiratory tract, and the location of the lung involvement would suggest primary localization in the bronchial lymph nodes with extension from them into the lung parenchyma. Lack of positive agglutinations up to the eighteenth day, and a high phagocytic index for the Brucella organism on the eleventh day of the disease, added considerably to the problem of diagnosis.

POISONING DUE TO THE INGESTION OF A MIXTURE OF SODIUM BICARBONATE-SODIUM FLUORID*

By J. C. Geiger, M.D.
San Francisco

During the late afternoon hours of Monday, November 18, 1935, P, aged eighty-seven years, was admitted to the San Francisco Hospital seriously ill, after having taken baking soda some six or eight hours previously. In placing a "hurry call" for the ambulance, a neighbor furnished the information that the man's daughter, S, aged fifty-three years, had died within the hour, of what appeared to be some form of poisoning. With only these meager data in hand, an investigation was initiated.

REPORT OF CASES

Case 1.—From the patient, P, it was learned that he had eaten dinner on Sunday, November 17, 1935, with his daughter, S, and other members of the family. The foods served included: roast turkey, dressing, carrots, spinach, applesauce, celery, bread and butter, gingersnaps, and pumpkin pie (all fresh foods). None of those present at the dinner were ill other than P and S. P returned to his home about four o'clock that same afternoon, and retired later without taking other food or drink. On arising at nine o'clock Monday morning, November 18, 1935, and before drinking a cup of chocolate, he prepared and took "half a teaspoonful of baking soda in half a glass of water." The baking soda was part of a quantity given him by his daughter, S, the day before, in a paper bag, as part of a two-pound package purchased by her, in bulk, on Saturday, November 16, 1935. According to the patient's own story, as given to members of the resident staff of the San Francisco Hospital, he vomited about noon, had severe pain over the chest, perspired freely, had diarrhea, experienced a continued taste of the soda, had loss of power in the extremities, and finally collapsed.

The patient's private attending physician was called about three o'clock in the afternoon, and was furnished the information that the elderly man had "had a stroke." On examination, he found the patient unconscious and in a serious condition, with a foamy exudate blown from the anterior nares, "at a rate of about an inch every four or five seconds." In his rapid and necessarily cursory examination, the physician found: evidence of vomiting (the vomitus was liquid, containing no solid material at all), no diarrhea, the eyes reacted to light, while the throat was dry and there was a definite wrist drop ("radial palsy"). Immediate hospitalization was recommended and arrangements initiated. After a fifteen-minute wait for the ambulance, a second call was placed by a neighbor, and the man removed by ambulance to the San Francisco Hospital.

On admission to the San Francisco Hospital the patient was cyanotic, stuporous, but responsive to questioning, and presented the picture of an acute illness involving, perhaps, the respiratory tract, the gastro-intestinal tract, the cardiovascular system, and the central nervous system. During the examination made by members of the resident staff of the hospital, he suddenly died, within twelve hours after having taken the soda.

⁂

Case 2.—From the private physician and the patient's daughter, it was learned that S, also, first used the soda on arising early Monday morning, November 18, 1935. She, also, had retired Sunday evening without taking other food or drink, following the dinner of that afternoon. She was accustomed to taking half a teaspoonful of soda on arising, apparently, usually about 6:30 o'clock. A few minutes after taking the soda she remarked to her daughter that "that soda made me sick," whereupon she vomited violently. This was followed shortly after by profuse perspiration, severe diarrhea, cold extremities, cramps in the legs, urticaria over the neck and trunk, and, finally, prostration. She was put to bed and treated by her physician as having a severe form of "food poisoning." She slept awhile and seemed better for a time, but quickly became worse in the early afternoon and died about three o'clock.

The soda used by S was from the same lot as that purchased by her on Saturday, November 16, 1935, and of which she gave a quantity to her father, P, on Sunday, November 17, 1935. None of the other members of the family were ill, and they, likewise, did not take any of the soda. Samples from the package submitted as being the soda originally purchased by S, on qualitative chemical study, showed definite evidence of arsenic and relatively large amounts of fluorin. Quantitative analysis later showed the arsenic content approximate fifty parts per million and the sodium fluorid to approximate 60 per cent, with sodium bicarbonate but 40 per cent of the total sample. Additional packages, obtained by inspectors from the Department of Public Health on Tuesday, November 19, 1935, from the same source as the package purchased by S, were studied in the laboratory, and their contents, on qualitative analysis, showed both fluorin and arsenic to be present, and on quantitative analysis, checked closely with the sample referred to above.

⁂

Case 3.—It was learned on Tuesday, November 19, 1935, that O, aged sixty-one years, had died on Thursday, November 7, 1935, under circumstances which indicated that sodium bicarbonate might have been the responsible factor and the cause of death. It was subsequently learned that she had taken part of a teaspoonful in water, with a woman friend, on the evening of Wednesday, November 6, 1935, presumably to relieve gastric distress following a meal. Her friend induced vomiting, saying that "the soda did not taste right," but O was not unfavorably impressed by the taste of the soda. She was found dead in her home the following day, Thursday, November 7, 1935. The soda taken by O was obtained from the same source as that used by P and S.

CORONER'S FINDINGS

These three cases were all considered at the same coroner's inquest.

Toxicologic and Pathologic Reports.—These may be briefly summarized:

In the case of O, the coroner's toxicologist reported that fluorin and arsenic were easily demonstrable in the stomach and contents, and in the "baking soda" as well.

In the case of S, fluorin and arsenic were not demonstrated in the stomach and contents; and in the specimen of sodium bicarbonate studied, fluorin was present and the presence of arsenic, while not demonstrated by the Reinsch test, was demonstrable by the Gutzeit test. In the case of S, the positive significant gross changes involved a yellow liver with evidence of cloudy swelling of the cells, with microscopic changes showing toxic degenerative changes (cloudy swelling) of heart muscle, liver cells, the epithelium lining the tubules of the kidney and acute hemorrhagic congestion of the lungs, all interpreted as evidence of protoplasmic poisoning.

In the case of P, the sodium bicarbonate involved was the same as that in the case of S, and the stomach and contents were negative for fluorin and arsenic. The pathologic findings in P, while less marked than in S, were essentially the same (except for evidence of heart disease with coronary sclerosis, as one might expect in a subject of the ninth decade of life), with evidence of a protoplasmic poison having resulted in toxic degeneration of the liver. The coroner's jury, on the basis of the evidence submitted, found that "P, S, and O had come to their deaths after using baking soda with a mixture of sodium fluorid. . . ."

---

* From the Department of Public Health, city and county of San Francisco.

OTHER CASES REPORTED TO THE DEPARTMENT

Concurrent with the investigation into the circumstances surrounding the deaths, during which time the findings were given full and complete publicity in the newspapers and through radio broadcast, eighteen cases of non-fatal poisoning, traceable also in all instances to the sodium bicarbonate-sodium fluorid mixture purchased later than October 23, 1935, were reported to the Department. In these instances the bicarbonate-fluorid mixture, used to the extent of one teaspoonful to a quantity of pancake batter sufficient to make pancakes for a family of two adults and six children, produced symptoms and signs of severe gastro-intestinal irritation with vomiting, abdominal cramps and diarrhea, consistently in all those who ate of the pancakes. The maximum dose taken, in any instance, was one teaspoonful in a glass of water. In those instances in which the packages of baking soda were available for laboratory study, qualitative analysis showed the presence of fluorin and arsenic, and quantitative analysis showed varying amounts of both up to 74 per cent sodium fluorid, forty-four parts per million of arsenic, and no sodium bicarbonate. Inasmuch as the various samples studied, all from the same general source, gave varying results on study by the same methods of analysis, one is forced to be impressed by the "spotty" or "pocket" distribution or lack of homogeneity of the mixture.

HOW SHALL THE INSECTICIDE PROBLEM BE SOLVED?

The experience described in this paper has two major aspects: The local problem, with particular respect to the appropriate rigid supervision of persons, firms and corporations dealing in food and drugs, of greater importance in a port city or in a railway terminal city, but a problem which may exist in any city, should be met through suitable legal instruments giving effective authority to the local health official or to the proper state agency, provided that agency is equipped, financed and staffed sufficiently well to cope with the problem, to the end that such appropriate rigid supervision of such dealers may obtain. As we see it, however, the greater and more important aspect involves the whole problem of insecticides, their labeling, distribution, sale and use, and the increasingly important relation of spray residue on foodstuffs, particularly fruits and vegetables, to the personal and public health.

It should not be necessary to point out that fluorids and arsenates are being more widely used in agriculture today than ever before; that in certain areas the content of arsenic in the soil is so great, from spraying, that the agricultural products grown in the area contain significant quantities of arsenic; that present legislation and regulations do not require the labeling of fluorin and arsenic-containing insecticide compounds as poisonous; that insecticides are all too frequently shipped, transported, distributed, sold and used in close association with food and drugs, in the home, the store, the warehouse, on the farm, in the food factory and elsewhere.

Knowing these facts, the question is not, "How do poisonings, such as that herein reported, occur?" but rather, "Why do such poisonings not occur with greater frequency?" Any answer to this problem necessarily involves consideration of the possibility of the occurrence of mild affections unrecognized as caused by the ingestion of small quantities of fluorids, arsenates, or other insecticides or other poisonous compounds which may have been present on foodstuffs. Chemical types of "food poisoning," certainly less frequent during past years than bacterial or bacterial-formed toxic products types, are not to be forgotten in medical practice.

SODIUM FLUORID AS A TOXIC AGENT

Sodium fluorid has been widely advertised as non-toxic for the human, and as a constituent of ant powders the only warning given frequently has been "Keep away from children," implying by inference, perhaps, that it is safe for adults. In the eighteen non-fatal cases reported to the department during the course of the investigation herein reported, adults and children were affected. The quantities of the sodium bicarbonate-sodium fluorid-arsenic mixtures ingested varied from that quantity contained in a few pancakes made from batter sufficient for a family of seven, and in which but one teaspoonful was used for the entire batch of batter, up to one teaspoonful in water. It is but one step further to point out the possibilities offered by sodium fluorid on vegetables, as ant powder or other insecticide; for many ranchers or farmers are of the opinion "if a little of the spray is good, a lot ought to be better." The toxic properties and effects for the human, adult as well as child, of the doses cited, namely, a teaspoonful or less of the mixtures of bicarbonate-fluorid, should be carefully noted and considered by all thoughtful physicians and health officers.

THE ARSENIC COMPLICATION

The presence of arsenic was not entirely satisfactorily explained except that it might have been a contaminant of the commercial sodium fluorid in its manufacture. The possibility of any quantity of arsenic in the commercial product in excess of one part per million was practically denied by the manufacturers of the product involved, and the possibility itself has been both affirmed and denied by official medical and Federal Government authorities. Confusion to the entire epidemiologic study was contributed by the results of the chemical analysis done in the laboratories of the department, since, presumably because of the heterogeneous mixture with "spotty" distribution of the compounds, varying results, both qualitatively and quantitatively, were obtained in small samples of the same specimen one-pound package being investigated. Likewise, it would appear to be true that the presence of fluorids in the material tested affects the results of the ordinary standard tests for arsenic when the tests are carried out, as usual, in ordinary glass containers.

In the Gutzeit test, for example, hydrochloric or sulphuric acid, in reacting with the sodium fluorid mixture permits of the formation of hydrofluoric acid, which, in turn, attacks the wall of the glass container, dissolving sufficient quantities of the glass to permit of positive reactions for arsenic from the arsenic contained in the glass itself. Of course, with a prolongation of the time interval beyond the two-hour period ordinarily followed in standard procedure, the results obtained would indicate greater quantities of arsenic, for obvious reasons. Recheck analyses, in which the reactions were carried out in paraffin-lined containers, gave consistently negative results for arsenic. The only logical conclusion that can be drawn, therefore, as to the source of the arsenic in the mixture (as revealed in the laboratory studies executed during the field investigation by the Department of Public Health, the Coroner's Office, and the Food and Drug Administration of the United States Department of Agriculture) must consider that the varying quantities of arsenic found came, not from the mixture of sodium bicarbonate and sodium fluorid or commercial sodium fluorid, but from the glass containers in which the tests were carried out. It should be emphasized also that the time interval used in the test, as well as the quality of the glass containers themselves, are of considerable import in this respect.

SUMMARY

1. A mixture of sodium bicarbonate and sodium fluorid, sold in bulk as sodium bicarbonate or baking soda, was responsible for poisoning in twenty-one reported instances, three of which terminated in death.

2. Samples submitted by those made ill and by members of the families of the deceased, and those obtained by the inspectors of the Department of Public Health from the various sources involved (except those from intact barrels of the original product) consistently showed arsenic and fluorin on qualitative chemical analysis; on quantitative analysis these same samples were found to contain varying proportions of sodium bicarbonate and sodium fluorid, demonstrating a heterogeneous, "spotty," or "pocket" distribution.

3. The epidemiologic picture, at first confused by the positive reactions indicating the presence of arsenic in the specimens of "baking soda" (sodium bicarbonate-sodium fluorid mixtures) and of commercial sodium fluorid, was clarified through further study, which brought out the fact that hydrofluoric acid, found through the reaction of hydrochloric or sulphuric acid with the sodium fluorid of the mixture, dissolved the glass of the containers and released arsenic therefrom in sufficient quantities to give positive reactions for arsenic. Recheck tests in paraffin-lined glass containers gave consistently negative results for arsenic.[1]

4. It should be emphasized that there is no danger from sodium bicarbonate of standard brands, sold in good condition, in the original package.

5. The incident should awaken interest in the real and potential hazards existing in the salvage of foods and drugs, and the need for effective legislation which will require and provide adequate official supervision and regulation over all persons, firms and corporations dealing in foods and drugs.

6. This incident, as also those reported by Simpson and his coworkers,[2] should serve as a warning and give impetus to the medical profession as well as local, state and federal authorities and officials, to secure adequate control over the labeling, manufacture, distribution, sale and use of insecticides, particularly those containing fluorin.

IN CONCLUSION

Fluorid poisoning, as a result of the ingestion of quantities smaller than those heretofore considered toxic for humans, is a very real hazard to the public health, even as a cause of death, in addition to the effects of the mottling of teeth, as reported from Arizona and other points,[3] and gastro-intestinal irritation. The control of traffic in insecticides should receive attention as a medical problem, rather than simply an agricultural and entomologic problem, affecting the personal and public health.

101 Grove Street.

ACUTE FLUORIN POISONING*

WITH REPORT OF FIVE CASES

By Jesse L. Carr, M.D.
San Francisco

Discussion *by P. J. Hanzlik, M.D., San Francisco; C. D. Leake, Ph.D., San Francisco.*

OCCASIONALLY, in any year, a city the size of San Francisco is turned into a biological experimental laboratory by an unfortunate accident. The tragic residue of such misfortune accumulates in the civil courts of the city, while the scientific data is collected and compiled at the city morgue. As the result of a recent unfortunate circumstance in San Francisco, three deaths were recorded from the ingestion of almost pure sodium fluorid, and we wish to add to these three two more deaths which resulted from the voluntary ingestion of fluorid-containing insecticides with suicidal intent. All of these cases show consistent and similar anatomical changes which substantiate pathologic findings reported by others. They have an additional interest, however, in that they contribute to the knowledge of the minimum lethal dose of fluorid which will kill human individuals. It has been known for some years that reasonably small amounts of sodium fluorid or sodium fluorosilicate would cause death, and Marcovitch,[1] in 1928, discussed the acute toxicity of sodium fluorosilicate, reporting a fatal case where only half a teaspoonful of the substance had been ingested. Fatalities from less sodium fluorid than this are not available in the literature, but deaths from the substance have been reported by Sommelet,[2] Kockel and Zommerman,[3] Hickey,[4] McNally,[5] and Luhrig,[6] whose second patient had taken one-half teaspoonful of insecticide containing 99.6 per cent sodium fluorosilicate, while McNally reports death from ingestion of 4.5 to 5 grams of sodium fluorid. Much smaller doses than this, of course, will cause acute toxicity without death, and Kolipinski,[7] in 1866, pointed out that in human individuals any amount of sodium fluorid in excess of one-fourth grain (0.016 gram) is liable to cause nausea. Baldwin[8] reported that a quarter of a gram by mouth would cause nausea in two minutes, and Vallée,[9] in 1920, reported seven cases of poisoning by sodium fluorid where the amounts absorbed were reported as from 0.228 gram to 0.45 gram. Other reports seem to establish that the minimum toxic dose is somewhere around 0.05 of a gram, with the symptoms of gastralgia, nausea, vomiting, convulsions, paralysis of the motor center and salivation increasing to the minimum lethal dose, and that death would occur after the ingestion of four grams or perhaps a little less. The information on animals is somewhat more accurate. In 1867, Rubuteau[10] published data showing that when 0.5 of a gram was given to dogs by mouth, symptoms were produced, but he found that 0.25 of a gram by mouth produced no demonstrable changes. One gram intravenously caused serious symptoms, but was not fatal. In rabbits, 0.25 of a gram by mouth caused symptoms, and the same amount injected intravenously proved to be fatal. In 1894, Haidenhain[11] reported the fatal dose of fluorid for a dog to be 0.05 to 0.1 of a gram per kilogram of body weight when given intravenously. And Leake,[12] corroborating this finding, reported 87.5 milligrams per kilogram to be the minimum fatal dose intravenously in rabbits. Death occurred about forty minutes after injection of the minimum fatal dose. In continuing this work, Muehlberger,[13] in 1930, tested other fluorid salts than sodium fluorid, but with essentially the same findings. The symptoms he observed were salivation, diarrhea, tremor and, at times, terminal clonic and tonic convulsions. Animals receiving barely lethal or slightly smaller doses showed a persistent cachexia, and albuminuria was frequently present. In rabbits killed by sodium fluorid, the pathologic changes he noted were limited to the liver and kidney, the liver showing some congestion and hydropic degeneration, as well as some fatty changes in the cells. Schultz[14] found that lethal doses in experimental animals acted on the central nervous system, as well as upon the stomach and blood, producing a paralysis of the cord and brain, ending in stiffness, numbness, salivation, and gastric hemorrhage. The whole subject, in both acute and chronic forms, is presented in the excellent review of De Eds.[15]

---

* From the department of pathology (University of California), the San Francisco coroner's office, and the San Francisco Hospital, San Francisco.

In the first group of three cases to be reported, fluorid was taken in the form of sodium fluorid after being mistakenly sold for sodium bicarbonate and ingested with the same impression persisting. As far as can be determined, approximately half a teaspoonful, or three to four grams, was taken in these cases, with death following in from six and one-half to twelve hours.

REPORT OF CASES

1. *Accidental Poisoning Group*

Case 1.—Mrs. C. O., white, sixty.

At eight o'clock p. m. the subject was visiting a friend who had some gastric disturbance and suggested that she take a little soda for relief. The friend acquiesced, and took one-half of one teaspoonful (three grams) in water. Although feeling perfectly well, Mrs. O. also took half a teaspoonful (three grams) in water, to be sociable. They both noted an odd, rather bitter taste, and a few moments later both were nauseated. The friend immediately vomited her entire gastric content. Vomiting was attempted by Mrs. O., but was fruitless. There was a rather rapid prostration, a feverish feeling, and in fifteen minutes a diarrhea. Severe oral burning ensued and the tongue was sore. She remained with her friend, who had been able to vomit repeatedly, until midnight, when she went home. At this time, approximately four hours after ingestion, she was very weak, nauseated, and having a premonition of death requested an autopsy in the event of her demise. Her brother gave her some hot water and then retired. She died unobserved at approximately 2:30 o'clock the following morning, six and one-half hours after the initial symptoms and ingestion. The autopsy findings were consistent with the composite report, which follows. Chemical analysis showed fluorid and a trace of arsenic in the stomach, liver, and kidneys. Analysis of the material ingested showed 99 per cent pure sodium fluorid, and 250 parts per million of arsenic, the latter being regarded as a commercial impurity. Subsequent studies show the arsenic to have been dissolved out of pyrex glass of the container by the etching action of sodium fluorid solution.

* * *

Case 2.—Mrs. B. S., white, fifty-three.

It was the subject's custom to take a little baking soda twice a week in water shortly after arising in the morning. At 7 a. m., the day of her death, she entered the kitchen shortly after dressing and took one-half of one teaspoonful of a substance which she had purchased in bulk the previous day, and supposed was baking soda. Her husband found her a few moments later sitting in a chair with perspiration beginning to appear on her forehead. She remarked immediately: "Leave that baking soda alone—it is poison." Inside of ten minutes there was extreme nausea and vomiting, with diarrhea following about fifteen minutes after ingestion. A doctor was summoned and arrived approximately twenty-five minutes after the material was taken. He found the patient pulseless and prostrated. She was put to bed, still vomiting, and was given hot water each time emesis occurred. The type of poison was not known and no antidote was given. There was no abdominal pain. In approximately an hour she was semi-comatose and began to have successive chills. Hot-water bags were placed about her, following which she relapsed into coma again, from which she would awake, vomiting. She grew progressively weaker and had a constant premonition of death. At 2 p. m. she felt cramps in her legs and had some clonic spasms. She was given an alcohol rub, which eased her somewhat. About 2:30 p. m. her whole body broke out in a rash. Weakness was increasing. She had a feeling that she was burning up inside. She begged for water, which was administered, and attempted to vomit at this time, but was unable to raise any fluid. The patient was extremely weakened and muscular contraction was difficult. She was semiconscious, however, and able to converse with her daughter. At 3 p. m., eight hours after ingestion of the poison, she died, apparently from a respiratory paralysis. The autopsy findings in this case were consistent with those which are subsequently described. Fluorid was not recovered from either her stomach or viscera. The material ingested was 84.5 per cent sodium fluorid.

* * *

Case 3.—Mr. A. T., age eighty-six. Retired carpenter. Father of Mrs. S., Case 2.

The patient was found in bed about 2 p. m. by neighbors, who immediately summoned a doctor. Examination showed him to be salivating, frothing at the mouth and nose, practically pulseless, cold and comatose. He was transferred to the Central Emergency Hospital. By emesis in the sink, it was concluded that he had been vomiting. Because of this the stomach was not lavaged at the Emergency Hospital, but the patient was put to bed and kept warm. He improved, and at approximately five o'clock in the evening was able to talk. He gave a history of having eaten a large dinner the day before and, feeling distressed that evening, had taken baking soda. The following morning, upon awakening at seven o'clock, he felt sick and nauseated, and took approximately one-half teaspoonful more in water, the soda having been part of the package his daughter Mrs. S. purchased the previous day. This made him acutely ill and he vomited a number of times, which was followed by diarrhea. The vomiting and diarrhea continued the better part of the day. Later in the afternoon he noticed that his hands were growing weak and gradually becoming paralyzed. He felt very weak and had some pain across the lower part of his chest. Froth, which had been found exuding from his nose when first visited by his doctor, had disappeared, and at 5:30 p. m. his temperature was normal, blood pressure was normal, and pulse was 85. His hands and arms were paralyzed and there was some weakness of the lower limbs. He grew gradually weaker and died at 7:20 p. m. that day, approximately twelve hours after ingestion of the poison. Toxicologic examination of the stomach was negative for fluorid, and the presumption is that he had completely evacuated the substance by vomiting.

COMMENT

The clinical similarity of these cases is apparent, the only variation being rapidity of death after ingestion. The shortened interval in the first instance, we believe, is due to the inability to evacuate the stomach by vomiting, and this is substantiated to a great extent by the finding of fluorid in the stomach of the first individual, and by its absence in the stomach of the other two.

2. *Suicidal Poisoning Group*

The second group of two cases were the results of voluntary suicidal ingestion and, while no histories are, of course, available, it appears by the amount of insecticide remaining in either can that something less than an ounce of the material was taken. Both individuals were found dead in the morning, having died during the preceding night. Fluorid was recovered from the stomach in both instances.

PATHOLOGIC FINDINGS

The pathologic changes in all cases are consistent, and will be reported as a composite picture. Upon the initial incision one is struck by the extraordinary congestion and hemorrhagic infiltration of all of the organs, but particularly of the spleen and lungs. Throughout the pulmonary parenchyma, there is a dilatation of the vessels and congestion of the vascular channels, and blood oozes from the alveoli as the tissue is cut. Because of this infiltration the lungs are increased in weight, but they show no focal areas of necrosis or other damage. The heart varies with age and physical influences, but shows, in addition, a moderate dilatation, loss of muscle tone, and a congestion of the vascular beds. The liver is quite yellow, but the edges are sharp and the color is uniform. There are no areas of necrosis or acute damage, but on section there is a cloudy swelling apparent throughout. The spleen is enlarged, acutely congested and engorged with erythrocytes. The lymphoid elements are not prominent. The pancreas appears grossly normal, but the kidneys show an acute congestion, are rather edematous and moderately swollen. The reproductive organs in both male and female show no pathologic changes. In the gastro-intestinal tract there is an acute congestion, and hyperemia of the gastric mucosa, as well as similar changes to a lesser degree in the rest of the bowel. There are small points of hemorrhage in the gastric mucosa, and the stomach contains blood-stained fluid.

Microscopic sections show an edema of the heart muscle, with some separation of the fibers and a little cloudy swelling of the cytoplasm. There is a general congestion of the circulatory channels, but no apparent endothelial damage. The lungs show the diffuse congestion described grossly with cells packed densely into the capillaries of the alveolar walls, and with fresh hemorrhage in the alveolar spaces. There is no acute focal necrosis and no evidence of inflammation other than the acute congestion. The liver shows a moderate fatty infiltration of the cells, with large droplets in the cytoplasm. The cytoplasm, in addition, is quite cloudy, and the cells are swollen. There is no degeneration or breaking up of the nuclei, however, and no changes about the portal areas. The spleen is congested with erythrocytes and the sinusoids are packed full of these cells. There is no apparent change in the white cell element, while the pulp and corpuscles are normal excepting for a moderate edema. The acinar cords of the pancreas are normal and the islets show no changes. The glomerular tufts of the kidneys are congested, and the capillary channels filled with erythrocytes. The glomerular capsules are clean, however, and the capsular spaces contain no exudate. There is a general cloudy swelling of the cells lining the tubules. The sections of the genital system are normal. Sections of the gastro-intestinal tract show an acute hyperemia and congestion of the circulatory channels. There is a little blood on the surface of the mucosa, and some of the mucosal cells are cloudy and beginning to degenerate. Changes in the central nervous system are limited to edema and a congestion of the vascular channels.

COMMENT

These findings are consistent with the pathologic observations in the previous cases of fluorid poisoning which have been reported by others. The clinical symptoms, too, substantiate published reports excepting the rash which appeared currently in Case 2. This, we feel, was not a toxic rash, as has been suggested, but a multiplicity of petechial hemorrhages following the chemical action of the fluorid ingested. As Kobert suggests in his "Lehrbuch der Intoxikationen," the coagulation of the blood is abolished because of the binding of the calcium with fluorin, forming the insoluble calcium salt. While this exact mechanism may be subject to some question, there is no question that sodium fluorid is an active and efficient anti-coagulant, and such a property was probably operative in the individual. The hemorrhages were the same cutaneous petechial type that one would see in any other hemorrhagic diathesis, whether chemical or due to physiologic changes in the preformed clotting elements of the blood. The consistent bloody fluid found in the stomach is also probably partly due to this anti-coagulant factor.

The mechanism of fluorid toxicity appears to be most logically on the basis of a combination of a fluorid ion on calcium metabolism, as suggested by Kobert and others, as well as from its inhibitory action on lipase and other enzymes as reported by Amberg and Loevenhart.[16] According to Embden and Lange,[17] and Embden and Hentschel,[18] the presence of increased amounts of fluorid ion interferes with equilibrium between lactocidogen, lactic acid and phosphoric acid in the blood stream. This, as De Eds [15] suggests, may contribute, in interfering with the physiology of normal muscle contraction, to the extreme weakness experienced by these patients. From pathologic observations it is apparent that the salt acts as an acute protoplasmic poison, and the cloudy swelling and early cytoplasmic damage which is seen in all of these cases is the result of its influence.

While none of these cases of either accidental or voluntary intoxication were apprehended early enough to attempt the administration of a remedy, it has been suggested by Vallée, and Stanton and Kahn that administration of a soluble calcium salt would, to a great degree, bind the mobile fluorid ion and result in detoxification. Large amounts of milk have been suggested and used with some benefit, due probably to the calcium effect, while Stanton and Kahn [19] report a case that recovered after a lethal dose of sodium fluorid, which was treated by massive gastric lavage, lime water and calcium chlorid.

CONCLUSIONS*

1. Five cases of acute fluorid poisoning are reported which corroborate the clinical and pathologic findings of previous reports.
2. Terminal cutaneous petechial hemorrhages are observed, and their presence attributed to the anti-coagulant action of fluorin.
3. The mechanism of fluorid toxicity is probably due to a combination of formation of an insoluble calcium salt, and by the interference of the action of enzymes and lactic acid metabolism.
4. Three grams is a sufficient quantity to cause death in man.
5. Gastric lavage and subsequent stomach washing with lime water, milk, or other calcium salts, are at present the most proper treatment.

DISCUSSION OF PAPERS OF DRS. GEIGER AND CARR

P. J. Hanzlik, M. D. (Stanford University School of Medicine, San Francisco).—Doctor Geiger's paper covers the problems of acute and chronic fluorid poisoning so well that I can add but little more than approval. Doctor Geiger suggests the proper remedy for avoidance of such a shocking occurrence as happened in San Francisco, and the public is clearly entitled to that protection. No one today, who fully understands the phenomena of chronic intoxication, would disagree with the contention that insecticides and spray residues constitute a public hazard of large proportions. Minute quantities of these poisons act so insidiously and slowly that they may actually be the etiologic factors in some common disorders, the symptoms being much alike. Fluorid, in any form, is one of the most dangerous insecticides and contaminants of natural foods and waters. So-called "mottled enamel" or bleaching of growing teeth in animals occurs after taking in food something like only fourteen parts per million of fluorid, and in children one part per million. There are probably other systemic abnormalities caused by prolonged ingestion of fluorid. The action is apparently not a simple matter of decalcification, because calcium fluorid produces the same effects. What is fundamentally involved in fluorosis is as yet undetermined, although some intrinsic impairment of protoplasm and enzymes appears plausible, which merely emphasizes the insidiousness of this intoxication. The complete elimination of fluorin as an insecticide, and use of soils and waters where it is a contaminant is the only remedy at present. Constructive work on insecticides should concern itself with the development of volatile organic substances which leave no residues, in order to eliminate all hazards to health. This paper again indicates Doctor Geiger's alertness and constructive attitude on all matters pertaining to the health of the people.

⁂

P. J. Hanzlik, M. D. (Stanford University School of Medicine, San Francisco).—Doctor Carr's summary brings up to date practically all that is known about acute fluorid poisoning. The disionization of calcium in the blood and tissues is undoubtedly responsible for the symptoms and tissue changes of the acute poisoning, and the more soluble the fluorid the more rapid the onset and more violent the symptoms, as occurred in these cases. Chronic poisoning is, of course, different fundamentally, since calcium fluorid and insoluble fluosilicates produce the intoxication quite readily. Calcium is the choice antidote for acute poisoning and should be used locally and systemically, the gluconate being better tolerated than the chlorid, both intramuscularly and intravenously. Charcoal can be profitably given in liberal quantities and left in the stomach after the lavage is completed. Tremors or convulsions, if present, can be controlled with barbital. According to Doctor Carr, the total fatal dose for a man is much smaller than has been frequently supposed. In the presence of food, recovery can probably result from larger quantities.

---

* Acknowledgment.—The author wishes to thank Prof. Frank T. Green, the San Francisco Department of Public Health, and the United States Bureau of Food Inspection, for chemical analyses, and Dr. Chauncey Leake for other valuable material and assistance.

⁂

C. D. Leake, Ph.D. (University of California Medical School, San Francisco).—As Professor P. J. Hanzlik of Stanford University has remarked in other discussions of reports by Doctor Geiger and the members of the staff of the Department of Public Health of San Francisco, the citizens and medical profession of the city may be extremely grateful for their splendid work. Doctor Geiger has developed a technique of frankness and honesty in his relation with the public and the profession which is almost unique, but which has been responsible for great and significant improvement in public health matters in San Francisco. The promptness with which Doctor Geiger and Doctor Carr are reporting to their scientific colleagues the essential facts in the recent fluorin poisonings in San Francisco is eloquent testimony of their desire to coöperate fully with their colleagues in every affair concerning public health. The difficulty of arriving at an accurate picture of the unfortunate situation is graphically described by Doctor Geiger. There is no doubt but that this incident will serve to bring about much more satisfactory public health control of hitherto unregulated food and drug dealers. It will also serve to bring to the city chemist improved apparatus and facilities which he has for so long needed.

Doctor Carr's report is an excellent review of the essential features in acute fluorin poisoning. The widespread use of various fluorids in pest control makes it necessary that all physicians be aware of the possibility of acute poisoning from these substances. The protection of water supplies to prevent chronic fluorin intoxication is a public health matter, and physicians must also be familiar with the symptoms of such poisoning. The review made by De Eds (*Medicine,* 12:1, 1933) is the best available on this matter.

It is interesting that the amounts of sodium fluorid taken by the individuals mentioned in Doctor Geiger's and Doctor Carr's reports is in the range of the minimal fatal dose that we found in animals. We found that 87 milligrams per kilogram would kill about half of the animals into which it was intravenously injected, and later we found that approximately this same dosage given by mouth was also in the minimal toxic range. This latter work was not reported. It was our opinion that the chief factor in acute fluorid poisoning is calcium precipitation. However, we brought forward definite evidence to indicate inhibition of enzyme action throughout the body (*American Journal of Physiology,* 90:426, 1929). We had previously found (*American Journal of Physiology, 76*: 234, 1926) that sodium fluorid by mouth is extremely irritating to the stomach mucosa, rapidly producing marked congestion and erosion in high concentrations. Although the weights of the patient referred to are not given, they took amounts of sodium fluorid apparently around three grams or more. Since there were two elderly women who died and one old man, it may be assumed that their weights were not very great and that they ingested and absorbed amounts of sodium fluorid in the range of 60 to 90 milligrams per kilogram.

The fluorids constitute a definite public health hazard, both from the standpoint of the accidental or suicidal ingestion of insect powders or chronic poisoning from contaminated water supplies. These reports by Doctor Geiger and Doctor Carr comprise an excellent survey of these dangers, and of the necessity of attempting to control them.

PSYCHIATRY AND THE LAW*

By Benjamin W. Black, M.D.
Oakland

Discussion *by Walter Rapaport, M.D., Imola; J. M. Scanland, M.D., Agnew; Margaret H. Smyth, M.D., Stockton.*

Much confusion has existed in the minds of laymen as well as physicians, and also in the minds of attorneys regarding the use of the term "insanity." Many maintain that the term is purely medical, while others as seriously contend that it is a legal contribution, both as to name and as to conception. Glueck states that the specific term "insanity" seems first to have been introduced into the law by medical experts, finally superseding such terms as madness, lunacy and mental unsoundness, which were borrowed from the very imperfect psychiatric knowledge of the day. The word "insanity" seems to have been quite generally used by commentators on the law in early times, and it is probable that all such terms were popularly used until they were taken over by the first systematic writers both in law and in psychiatry, and applied to this specialized field.

RULES OF LAW GOVERNING INSANITY AS A DEFENSE TO CRIME

The rules of law governing insanity as a defense to crime are vague and confused; clearly unsound in that they are based upon notions of the mental disorder discredited by medical science. Owing to the careless use of language by judges and others in the law, insanity has become synonymous with criminal irresponsibility, by reason of a certain type and degree of mental disorder which was noted far in advance by means of artificial tests of criminal responsibility. Because the law has preëmpted the term "insanity" and specialized it, judges frequently employ the term in the sense of irresponsibility, while psychiatrists seek other terms to distinguish the mentally-ill without reference to criminal responsibility. This practice has resulted in judges on the bench frequently attempting to distinguish between "legal insanity" and "medical insanity." This subject has been under discussion by English and American courts, legislators, and legal writers for more than a century. As long ago as 1800 the brilliant Lord Erskine, in his argument as counsel in the trial of Hadfield, attempted to lay down a universal test of responsibility in cases where the defendant suffered from a mental disease. His effort and the efforts of others have yet failed to attain clarity and uniformity; and even to this date, no universal test of responsibility has been generally adopted. There are many reasons for this; but for a branch of learning which has as a specialized objective largely the definition of words and their making, the law is strangely lax in its use of the term. Unfortunately, the word has no technical meaning either in law or in medicine, and is used by the courts and by legislators ordinarily to convey either one or two meanings:

---

* Read before the Neuropsychiatry Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13-16, 1935.

(1) A type or degree of mental defect or disease, or (2) Such a degree of mental defect or disease as to entail legal consequences, as for example commitment to a state institution, appointment of a guardian, or to avoid a contract or relieve responsibility for crime.

Many states have a provision in law that no act can be punished which was done "in a state of insanity," or while the person "is insane." In one decision, this was held to mean that no act done by a person suffering from a mental disorder of any sort could be punished. On the other hand, it is generally held that persons are exempt from punishment only when so mentally disordered as to come within the test of responsibility which has been established or accepted in the particular jurisdiction served by the court. Great clarification would immediately result if the term "insanity" could be eliminated, and in its place the use of some other term as, for example, "mental disorder" or "psychosis," or by the use of a more specific term when referring to the medical concept of mental ill health, and other terms clearly legal to describe the concept having to do with the lack of responsibility by reason of insanity at the time the crime was charged, or present insanity at the time of the criminal proceedings.

PRESENT ATTITUDE OF CALIFORNIA COURTS TO INSANITY

For the purpose of this discussion, the present attitude of the courts relative to insanity in California is attempted, so that our conception concerning the term "insanity" and its implications when used as a defense for crime may be better understood and at the same time pertinent facts may be submitted which permit a more intelligent service by physicians who may be called to serve the courts. From a recent charge to a jury in the Superior Court in this State, one may find clearly the attitude of the Bar toward the plea "not guilty by reason of insanity" as usually permitted as a defense for crime. This particular Superior Judge stated that the general test which is recognized by the law in California as being the test by which to determine whether or not a person charged with a crime should be held responsible for his acts or should be excused because of some diseased mental condition, is called the Right and Wrong Test:

> "The law presumes every man to be sane and to possess a sufficient degree of reason to be responsible for his crimes until the contrary is proven. To establish a defense on the ground of insanity, it must be clearly proven that at the time of the committing of the act the party accused was laboring under such a defect of reason from a disease of the mind as not to know the nature and quality of the act he was doing, or if he did know it, that he did not know he was doing what was wrong.
>
> "It is at once apparent from a mere statement of this test that there are many persons suffering from various degrees and kinds of mental diseases, and who for most purposes would ordinarily be regarded as insane, but who nevertheless have sufficient mentality to know the nature and quality of their acts and to know that what they are doing, or may do, is wrong, and who, therefore, are to be called sane under the legal test just given. The law is thoroughly aware that under the right and wrong test, persons who are mentally diseased may nevertheless be found to be sane, but the reason for the character of the test is to be found in the purpose for which the test is used. The right and wrong test was never intended as a method of determining the existence or nonexistence of mental disease. It was intended as a method of determining whether persons charged with crime should or should not be relieved of the ordinary consequences of their acts by reason of a diseased mental condition. The law does not recognize a diseased mental condition as being of itself a defense to crime any more than it so recognizes a diseased physical condition; and a diseased mental condition relieves a person charged with crime of the consequences of his acts only when his defect of reason is such that he is not aware of the wrongful nature of his act."

FINDINGS OF THE EXAMINING PHYSICIAN

With this clearly in mind, a physician called to examine a person who has entered such a plea must find that the patient at the time of the commission of the crime must have been so deranged mentally as to be unable to determine the difference between right and wrong. He must have been so seriously deranged mentally as to be unaware of his surroundings: unable to tell where he was, who he was: or properly identify persons with whom he was associated or with whom he came in contact. He must have been, because of his mental disorder, so greatly deranged as to be unable to appreciate the action of the court or confer with counsel relative to his own defense. He must be unaware that the commission of a crime results in punishment, and must be unable to understand that if guilty of the crime charged, he will be punished by commitment to the penitentiary or punished in some other manner.

CALIFORNIA LAW REGARDING COMMISSIONS OF THREE PHYSICIANS

In this State the law permits the court to appoint a commission consisting of not more than three physicians, one of whom shall be an active member of the staff of the state hospitals, and either of the other two may or may not be a trained psychiatrist, but each must have had experience concerning insanity in order that they shall advise the court relative to the findings after examining the defendant in court and hearing the testimony given. In criminal proceedings the defense, as well as the prosecution, is permitted to employ alienists who are presumed to have special knowledge governing mental disorders, and who are expected to testify from examinations made, from information received, and from observation in the court, their conclusions relative to the mental capacity of the defendant. The commission appointed by the court is expected to reserve its opinion until all the testimony is in, and then arrive at an opinion when all the facts are in its possession. The commission is presumed to be entirely impartial; the presence of members of the commission in the court is in the capacity of expert advisors to the court itself. The jury makes the final decision, and in spite of the testimony of experts and alienists who may appear, the decision of the jury is final, and when the jury determines the mental capacity of the defendant, such a decision must stand as a part of the record of the court. Alienists and other physicians are often times expected to testify from a series of hypothetical questions presumed to cover the testimony introduced, and from such questions draw the conclusion as to the insanity of the hypothetical person, well known to all to be the defendant in the case.

RESPONSIBILITY OF THE INDIVIDUAL PHYSICIAN AS A PSYCHIATRIC EXPERT

A psychiatrist or other physician appointed by the court or employed by either the prosecution or defense to examine a person charged with a crime whose defense is a plea of "not guilty by reason of insanity," must appreciate that his determination in the case under present court procedure is one of responsibility or lack of responsibility governing the action of the patient at the time of the commission of the crime charged. The physician must secure a very complete history, even going back to the ancestry of the defendant to determine any mental trends, diseases, or disorders in the family tree. He must secure information concerning the birth of the person; his infancy, any facts having to do with abnormalities of birth; delayed development as demonstrated in delayed walking or talking; any serious diseases from which the patient suffered in infancy. He must rather clearly distinguish the amount of schooling the patient received, his adjustment to school life, subjects in which he excelled, his general information acquired since leaving school, his general reaction to his environment up to the time of the commission of the crime, as well as his adjustmejnt to society and to business or to his profession. He should determine the reaction of the patient to the facts relative to the commission of the crime and to the events immediately subsequent to the commission of the crime. Did the prisoner or patient plan the crime with any degree of intelligence; was the plan reasonably successfully carried out; after the crime was committed, was a reasonable attempt made to conceal the crime; did the patient attempt to evade arrest and conceal himself from the police, and did he attempt to escape? What was his attitude at the time of arrest and since his confinement; his philosophy` of life relative to the commission of the crime, the value of property, sacredness of person? The presence of delusions or hallucinations, if found, should be carefully analyzed to determine if there is any relationship between such delusions and hallucinations and the crime committed. Does the prisoner have sufficient memory, recent and remote, to remember reasonable events, both before and after the time the crime was committed; is he sly in his attitude toward the physician, and does he attempt to conceal pertinent facts relative to the crime for the purpose of exonerating himself from blame?

PROCEDURE WHEN IT IS CLAIMED A PERSON IS INSANE

In the State of California physicians are concerned with another phase of the term "insanity" and its implications as applied to persons suffering with mental disorders. A person may be found in his home to be suffering with a disorder of mind that in the opinion of his relatives or neighbors makes him dangerous to be at large. When such is true, the interested person proceeds to the office of the district attorney where an affidavit is filed in which the offending party is alleged to be insane. The affidavit must definitely state that there is a degree of mental unsoundness to an extent as to endanger the life of the person concerned; the lives of his immediate associates or members of his family, and that the person so concerned is also a menace to property. Under such conditions, the court of proper jurisdiction issues a "warrant of apprehension," and when such warrant is issued, it is placed in the hands of a police officer or a deputy sheriff, who calls at the home of the patient and takes him into custody, and delivers such a patient to a place of detention—the county jail, a room in a county hospital or, in the larger counties, the psychopathic ward, where he is held for a period of observation.

Shortly after his delivery to the psychopathic ward or some other place of detention, it is necessary under the present court procedure in this state, to "arraign" the prisoner. The judge appears before the patient or the "prisoner" so confined, and reads to him the affidavit, or makes a statement containing the pertinent facts contained in the affidavit, and indicates to him that the time for hearing is set for a given future date; that he may have the benefit of counsel; that he may have witnesses subpoenaed who will be required to testify in his behalf. He is also informed that if he is found to be insane and committed to a state hospital, he may have the right to appeal, provided the appeal is made within five days after such commitment, at which time his case will be tried in the Superior Court in the presence of a jury who will determine, on the basis of his appeal, whether or not he is insane. It is the experience of all persons who have to do with the detention of patients charged under such warrants, that not infrequently the judge makes this formal statement to patients who are in the midst of manic excitement from many of the various psychoses from which they suffer, or who are so confused in mind as to be unable to distinguish their location or the persons surrounding them, and in some cases they are even unable to determine their own identity. On the date set for hearing, such persons are personally brought into court and in the presence of witnesses, who may be loved ones and neighbors, the court hears the testimony relative to the mental disorder from which the patient suffers, particularly the erratic behavior, if such be present, or peculiarities manifested to these interested friends and neighbors who have led to the issuance of the warrant. The court appoints two physicians who may or may not be psychiatrists to hear such testimony, and in the presence of the court these physicians prepare a blank which is required by the state hospital service covering pertinent facts pertaining to the history and mental examinations. After a very short period of observation and with the testimony in their minds, these two physicians are expected to recommend to the judge concerning the sanity of the person concerned, and as to whether or not he should be committed to a state hospital. The judge is not bound to follow these recommendations, but may determine individually as to the disposition of the case. However, under ordinary conditions, he accepts the recommendations of the two physicians appointed, and if the recommendation is commitment, the patient is committed. The judge may also, in his discretion, discharge the patient from further custody of the court, even though the person has a well marked psychosis, but is not shown to be a menace to other persons or property.

CRITICISM OF THE PRESENT LAW OF COMMITMENTS

This procedure has come to be known in loose language as "a finding in medical insanity." The law under which such commitments are made, with certain modifications and amendments, dates back to more than half a century. Modern thought is in favor of doing away with this apparent criminal approach to persons long recognized as suffering from a mental illness. The present law does not presume to take into consideration the simple fact that the person under consideration is suffering with a mental disorder and requires institutional care, unless it is found that such a person, by virtue of behavior already shown, becomes a community menace. Attempts have been made to modify the law to permit a more scientific approach with the simplification of court machinery to permit the admission of mentally sick individuals to state hospitals without the stigma that is always incidental to such court action.

DEVELOPMENT OF PSYCHOSIS SUBSEQUENT TO COMMISSION OF A CRIME

Between the time of the commission of a crime and the date of trial, a patient confined in a prison awaiting trial may develop a psychosis. If such is found to be true, the court orders a hearing to be conducted under conditions similar to those of a civil commitment just described. If the prisoner is found to be insane, but it is determined that his insanity has no relationship to the time of the commission of the crime charged, he is sent to a state hospital where he remains until his mental condition is sufficiently recovered so that he may be discharged. It is a requirement of law that when such a person is discharged from the state hospital, he must be returned to the sheriff of the county of original jurisdiction, and the district attorney is required to proceed to prosecute the case under the original indictment which refers to the crime committed. The fact that he has been a patient in a state hospital does not have any bearing upon the case if it is at this time shown that the patient was responsible at the time of the commission of the crime.

THE TERM "PSYCHOSIS," FROM THE MEDICAL AND LEGAL POINTS OF VIEW

The term "psychosis" now has a modern usage to indicate the presence of a mental disease, and is used to define a mental disorder of a functional type or one organic in origin. It is used in the practice of medicine by physicians who are careful of their language and properly by psychiatrists in discussing mental diseases, and has no relationship whatever to the legal aspects in any given case. The term itself does not take into account menace to property or person, nor does it have any relationship to responsibility to the law or the ability on the part of the patient to distinguish between right and wrong. The classification of the American Psychiatric Association should be the basis of all findings in the practice of medicine by psychiatrists in dealing with mental patients. If this terminology is used, it will tend to eliminate from our ordinary work the use of the term "insanity," which has no connection or relationship whatever to the term "psychosis," and it will enable the intelligent physician to properly distinguish and label the presence of mental diseases without the use of this term.

ETHICS RELATING TO EXPERT TESTIMONY OF ALIENISTS

Psychometric tests as such are not required to be covered in the testimony of alienists, but are important in their hands to assist in decisions relative to responsibility. Even in the presence of a mental disorder under our present court procedure, insanity as a defense for crime may not be shown. An alienist who is retained by either side in a case involving the commission of a crime should accept a retainer only for the purpose of making an examination of the prisoner, after which he should render a report to the attorney who arranged for such examination. He should draw his conclusion quite independently of any interests the counsel for the defendant may have in his examination. If he is retained by the prosecution and after a complete investigation has been made, concludes that the patient is not insane, he may then properly agree to testify for the prosecution. If, on the other hand, he finds that the patient is insane, he is similarly bound to make such a report to the prosecution and to state his position clearly when, under ordinary conditions, he will not be permitted to testify for that side. He should not, according to professional ethics, testify in opposition to the side for which he made his original examination. The literature contains many opposing decisions relative to this particular matter, but it is generally agreed that "to require a physician to render expert testimony without proper compensation would, in the last analysis, be antisocial." It is also considered that a reputable attorney dealing with a reputable physician would not arrange for testimony to be given by such a physician if he had been retained by the counsel for the opposing side and for whom the original examination was made, even though his testimony were not used by the side that originally retained him.

ATTITUDE IN COURT OF PHYSICIAN WHO TESTIFIES

A physician should not be concerned with the ultimate guilt or innocence of the prisoner examined. He should assume the attitude that his information has been acquired in a legitimate manner, and he is coming into court having been properly retained to give expert opinion for the benefit of the court and jury in order that findings of justice to the prisoner may be made. An alienist should never appear in court without having carefully prepared his case. He should not only know the case at hand, but he should be familiar with the literature, both medical and legal, governing such cases, and as it applies to conditions under which he is working. He should assume a neutral attitude, being truthful in his answers, and sincere and impartial in his testimony and the deductions made from the testimony. Only under such conditions may alienists expect to demand and retain the respect which is due them as expert witnesses in criminal cases where insanity is an issue.

Highland Hospital.

DISCUSSION

Walter Rapaport, M.D. (Napa State Hospital, Imola). I wish to add my word of approval for the elimination of the word "insanity" from medical diction and the relegation of that term entirely to legal terminology. I never use it in a medical sense, in or out of court, and that fact alone has saved me the embarrassment of quibbling over so-called medical and legal insanity.

One phase of the question of insanity has not been touched upon by Doctor Black, and that is when the question arises after arraignment and before the termination of the trial. If it appears to the court, either by suggestion of counsel or by any other means, that a defendant has not sufficient mental capacity to proceed with his defense, the court interrupts the trial and directs an inquiry into the mental capacity of the accused. In that case the requirements are a little different from that in the issue of insanity regarding the defense.

The question of the last aforementioned instance is not whether the accused is suffering from a mental disease, but whether or not the accused has sufficient mental capacity to understand what is going on, and to assist his counsel in the conduct of his defense.

While it is true that the mere showing of the presence of mental deficiency is not a defense to crime, yet here, as in all other questions of criminal procedure, the question of intent is relevant. Therefore, if the mental age of the individual is so low that he would not be able, by reason thereof, to form an intent, then it would be material as a defense. In many states it has been decided that the mental age of seven years is the dividing line below which the assumption is that the accused would not have sufficient intelligence to form an intent.

When a showing is made that a psychosis has been developed subsequent to conviction, the individual may be treated in the prison or sent to a state hospital for the insane for treatment. If he should recover before the expiration of his sentence, he is returned to the prison for completion of his sentence. If he does not recover prior to the completion of his sentence, his status changes at the termination of his sentence to that of an ordinarily committed insane person. If the sentence is capital punishment, and the individual develops a psychosis before the sentence is carried out, the sentence is stayed until he recovers. He may, during this time, be kept at the prison or be sent to a state hospital for the insane, to be returned as before mentioned.

The question of the relationship between a person suffering from mental disease and the making of contracts is also a pertinent one, but does not concern us in the present discussion.

The expert frequently invites undeserved condemnation because of his lack of understanding of what is required of him. I have heard it said that a medical expert should confine himself to medicine and disregard all else.

To follow this advice implicitly leads to trouble, because it permits of much speculation and theorization; all permissible and commendable in medicine, but in the court it frequently only adds confusion. The court is interested only in the case at bar. It is not interested in what might happen in many and divers situations, but what it can reasonably be supposed did happen in the present situation. The court sets out what the law is, and what the law requires and expects. The expert should confine himself to these restrictions and attempt, if possible, to give his best judgment in the matter. The fact that the expert does not feel that the law is correct is not his problem in court. If he is interested in espousing his theories and speculations of what the law should be, he should do so before the legislature and not during his appearance in court.

It is conceded that certain peculiarities and even frank psychoses might be present in the accused. But in a plea of not guilty by reason of insanity, that is not the point at issue. Doctor Black has told you what the points at issue are; and, unless these peculiarities or psychotic manifestations are such as to meet the legal requirements of insanity, opinions on that score are immaterial and inconsequential, and if indulged in by the witness only befuddle and confuse the issue and bring contempt on the expert.

The issue of peculiarities or psychotic manifestations are material during the trial if, by reason of them, the accused cannot conduct his defense; or if, after conviction, the accused is found to be suffering from a psychosis, he may be directed to an institution for the treatment of his mental condition without disturbing the issue of guilt or innocence.

There is an element of law enforcement to which all should contribute their efforts, and it is not the duty nor the right of an expert to interject immaterial, speculative, or highly improbable opinions with the view that, by giving such opinions, he might help his client or give voice to his disapproval of existing jurisprudence.

Undoubtedly, there is much in medical jurisprudence that could be improved upon to the benefit of all concerned, and it would be, perhaps, an excellent move if this section were to have a standing and permanent committee whose duty it should be to study the problem to the end that better legislative action could be had. But the courtroom, at the time of a trial, is not the place nor the time for such activity.

⁂

J. M. Scanland, M. D. (Agnew State Hospital, Agnew).—The subject of psychiatry and the law is one in which we are especially interested. We of our specialty are frequently "ordered" to give expert testimony in superior courts as psychiatrists, when the plea of "Not guilty by reason of insanity" has been entered as defense for crime, and in other cases in which the subject of insanity is an issue.

I agree with Doctor Black that the term "psychosis" is far preferable to that of insanity, and think we should school ourselves in the use of the more dignified and professional expression. To an extent, too, as Doctor Black has so well said, the use of the word "psychosis" rather than "insanity" might bring to juries and courts a better understanding of our conception of medico-legal responsibilities. However, it is likely that clever lawyers would soon come to define the term "psychosis" as it may apply to the subject of expert medical testimony to be much, if not quite the same, as is the present interpretation by the courts of the legal meaning of insanity.

Doctor Black, in his article, has referred to an interpretation and explanation of the laws of California by a Superior Court judge in a written summarization prepared for the guidance of medical witnesses in procedures in which insanity is a question, and in which it is clearly set forth that "the only test of insanity which is recognized in criminal cases is the right and wrong test."

The State Supreme Court has more than once ruled on the subject of such evidence, and states in an opinion of a certain case:

"Responsibility depends on whether the defendant knew the nature and quality of the act at the time of its commission, and the wrongfulness of the act. If he had sufficient mental capacity to know what he was doing, and to know that it was wrong, he is legally accountable for his act. Even though he may be mentally abnormal or defective, or may suffer from some nervous disorder, he is, under our law, held to full responsibility for his act unless the evidence brings him within the strict legal meaning of insanity."

This then is the law, and certainly it is not within our province, nor is it our intention or desire to question an opinion from such a source.

Another law, however, if added to the statutes of the State would, in my opinion, simplify and probably clarify this problem of psychiatric expert testimony. I have in mind and suggest an amendment of an existing law providing that Superior Court judges in cases in which defendants have pleaded "Not guilty by reason of insanity," appoint medical commissions as is now provided, adding a mandate to the effect that no other medical testimony be admissible.

An objection might be raised to this that such an act would be discriminatory, and therefore unconstitutional; but it would seem to me that Superior Court judges should have this latitude and authority in such cases, and that legislation to this effect could be created in a manner that would be constitutional.

Or, a law might be passed in this State similar to those in effect in other states, making provision that the Superior Court judges in cases wherein insanity is entered as defense be empowered to order the defendant confined in a state hospital for a period of not less than thirty nor more than sixty days for an examination by the superintendents and medical staffs of state hospitals, who will be required to give an opinion to the court as to the sanity or insanity of defendant at the time of the commission of the crime.

The statute now in effect provides that in such cases the Superior Court judge presiding must appoint two or more physicians to "examine defendant and otherwise inform themselves concerning his mental condition." In accordance with the provisions of this statute, Section 1027 of the Penal Code of California, the judge orders these alienists by him appointed to "examine the said defendant and investigate his sanity and to testify in court in reference thereto." Under this law both attorneys for the defendant and attorneys for the State may question, and cross-question, and examine the medical experts as freely as may the judge.

It would surely seem that this procedure should bring out all the worthwhile expert testimony necessary to the case on trial, and is a fair and just and comprehensive presentation of expert medical evidence.

If then, as above suggested, no other medical testimony be permitted in such cases, and if no other alienists be called by attorneys for the people, the ends of justice would be better served. How often have we seen a doctor or group of doctors offering expert testimony on one side of a case in court, and another or more doctors on the other, each side earnestly testifying to opinions, and even that which they profess to believe to be facts, that are entirely different one from the other; and it seems equally ridiculous that a jury of laymen may be expected to pick and choose between experts who testify to conflicting opinions. And if experts cannot agree, certainly juries cannot be expected to agree.

This imposition on the public and on our profession could, I believe, be remedied by the enactment of a short statutory provision as above suggested.

⁂

Margaret H. Smyth, M. D. (Medical Director and Superintendent of Stockton State Hospital, Stockton).—Psychiatry and the law have been running on parallel lines for a long time, but the indications seem to be that the lines are changing their direction and fusing into better comprehension of the two viewpoints in so far that both lawyers and medical men show a dissatisfaction with present meaning and procedure.

The term "insanity," to which blind custom and habit seem to have given a fixed place in legal and medical diction, possibly has had a legitimate excuse for being when first formulated, which the title of Doctor Black's paper points out. The legal side of psychiatry is certainly an important one, and especially so from the standpoint of responsibility.

A person suffering from a serious mental disorder is sent to a state hospital unless he has private means to be cared for elsewhere. In case a commitment is considered, legal procedure becomes necessary. The procedure in this and in many of our states could be changed in some respects with considerable benefit to the patient. It is encouraging to see better and more widespread understanding of modern psychiatry in the past several years, with psychiatric wards provided in many of our county hospitals and with deputies endeavoring to improve their methods in conveying their charges to the hospitals. A mental patient arrives at the hospital in a far more comfortable state than was true some ten or fifteen years ago, at which time a large number arrived in full restraint, fearful and uncomfortable.

The law now offers voluntary admission of patients on written request to the superintendent of the hospital. This law is being taken advantage of to such an extent that at the present time the six state hospitals in California have under care for treatment ond observation 504 voluntary patients. This plainly shows the course a mental patient with some insight will follow if medical aid is offered, and without the necessity of resorting to legal measures for admission to a hospital giving the patient the benefit of early treatment for his particular illness.

As for a trial by jury when required to determine sanity or insanity of a defendant, when the time comes for a medical man to ask the opinion of a jury as to whether a patient is suffering from chicken pox or smallpox, the psychiatrist may then hope to request a jury to sit on a case of dementia praecox or paresis. However, it is for the determination of sanity or insanity that the jury is called. The jury gleans its information from witnesses and the testimony given by physicians appointed by the judge of the court or called on the case. One cannot be too critical of the findings of the jury of inexperienced men when, in certain instances, the medical experts themselves disagree as to the diagnosis in the individual's case.

Psychiatry, I believe, is one of the most important branches of medicine, and I am in agreement with Doctor Black's statement that the classification of the American Psychiatric Association should be the basis of all findings in the practice of medicine by psychiatrists in dealing with mental patients.

FRESNO COUNTY PART-PAY PLAN*

By H. M. Ginsburg, M.D.
Fresno

Discussion *by A. E. Anderson, M.D., Fresno; John Hunt Shephard, M.D., San Jose; Charles A. Dukes, M.D., Oakland.*

A BRIEF summary of the Fresno County part-pay plan is submitted to show number of cases and results between July 7, 1933 (the date of its inauguration), and December 1, 1935. The plan was slow in its showing, due, first to a lack of medical social service workers, and, second, the fact that the plan was new and workers were reluctant to refer cases with small fees. The medical social service department, under the supervision of trained medical social workers, was not established in the General Hospital until October 1, 1934, and yet, as will be seen in the statistical report, it is a vital factor in the working of the plan.

HOW THE FRESNO PLAN FUNCTIONS

The plan has been outlined previously and, briefly, functions as follows: The medical social service department, located at the General Hospital, after interviewing patients, rates them into one of three classes. The first class (well-to-do) and third class (indigents) are cared for by their private physicians and General Hospital, respectively. The second class is rated according to its illness and ability to pay, and is referred to its physician of choice, or physician selected by rotation, with case history (financial and social) which specifies the amount patient is able to pay for the treatment. The physicians selected by rotation are taken from a panel supplied by the Fresno County Medical Society. The physicians on this panel have agreed to accept the recommendations of the medical social service department and, in case of doubt, the patient can be referred back for a second social report. It was felt that in a community the size of Fresno County, where three-fourths of the physicians are located in the city of Fresno, it would be better to have the patient report to the medical social service department and then be referred to the physicians, rather than have physicians interview the patients first and then send them to the service department to determine financial status. In this manner the physicians are not called upon to treat indigents in the home when they should be cared for at the county institution. The coöperation of the medical profession is essential to the proper working of the plan.

---

* From the Directors' Department of the General Hospital of Fresno County.

REPORT ON 588 CASES

From August 7, 1933, to October 1, 1935 (previous to establishment of the medical social service department) 149 cases were referred to private physicians. With the establishment of the department there have been referred, from October 1, 1934, to December 1, 1935, a total of 439 cases. This points out the value of trained workers. The total for the plan is 588 cases, divided as illustrated in Chart 1.

COMMENT

These cases do not figure the return visits made. If we assume that each patient returned on an average of three to four times, it would swell the visits made to about two thousand.

In all cases the medical social service department impresses the patients that their services must be for a cash consideration, and in the majority of cases it has so worked. Classified among the regular or full-fee office cases are major and minor surgical cases which have not been enumerated. The hospitals in this county, whenever necessary, have modified their rates according to request of medical social workers.

The patients have been satisfied, and repeatedly have expressed themselves as happy over the fact that they are able to secure private care at moderate rates. It is felt that the plan will show better results in the future.

The panel of physicians, when first compiled, was segregated as to surgeons, gynecologists, urologists, etc. It was found, after one year's experience, that it was better to have one straight panel, without divided specialties, and if a physician did not care for a particular type of case he could refer it to another physician of his group, or the medical social department would contact another physician.

General Hospital of Fresno County.

Chart 1.—*Fresno County Part-Pay Plan: Distribution Chart*

August 7, 1933, to December 1, 1935

Type of Case	Amount Payable	Number of Cases
Obstetrical	$35.00	2
	25.00	31
	20.00	4
Circumcision	15.00	3
	5.00	1
Tonsils, Adenoids and Circumcision	30.00	1
	25.00	1
	20.00	1
Tonsils-Adenoids	25.00	7
	20.00	8
	15.00	42
	10.00	38
	7.50	1
Office visits (Includes major and minor surgical cases listed in regular fee)	Regular or full fee	164
	50c per call	2
	75c per call	6
	1.00 per call	88
	1.50 per call	124
	2.00 per call	27
	2.50 per call	9
	3.00 per call	1
	4.00 per call	1
Dentist	Full fee	5
Shelter camp		2
Other counties		19
Total		588

DISCUSSION

A. E. Anderson, M. D. (1759 Fulton Street, Fresno).—The Fresno County Part-Pay Plan is an adaptation of the Alameda plan. It differs from the Alameda plan in that the patient first sees the social service worker instead of being referred by the physician to the social service.

The Fresno County Medical Society, conferring with the County Board of Supervisors, secured the adoption of this method of providing medical service for patients unable to pay the usual fees, but not in the indigent class, early in 1933. Until a trained social service worker was provided October 1, 1934, only a negligible number of patients were referred to physicians under this plan. During the period from October 1, 1934, to December 1, 1935, a total of 439 cases were referred, showing a very gratifying increase in the use of this service.

The social service work is done by one trained and two untrained members of this department at the County Hospital. The admissions to the hospital for the year 1935 were 7,100, and to the out-clinic 6,200. The investigation of this great number of patients is necessarily inadequate, and could be improved by additional workers.

Only occasionally can hospital facilities at private hospitals be arranged for under this plan. The Social Service Department emphasizes the need of prepaid hospital service in order to make this plan really effective. The lack of cash to pay the private hospital is a very frequent reason for admission as a charity case, when the patient states he can arrange for the medical services needed. The doctor is willing to take a chance on future payment for his services, but the patient, unable to pay the private hospital, is classed with the indigents, and so admitted.

Some seventy members of the Fresno County Medical Society have agreed to take care of these patients at whatever fee they can pay.

There are no definite or fixed rules for determining eligibility for this service. The social service tries to ascertain the personal need and inability to provide needed care by a private physician or at a private hospital.

My impressions lead me to the conclusion that in order to make this plan most useful, especially in cases of serious illness, we must have other hospital facility arrangements such as could be provided by hospital insurance.

John Hunt Shephard, M. D. (609 Medico-Dental Building, San Jose).—The report of Dr. H. M. Ginsburg on the operation of the Fresno County Part-Pay Plan furnishes some valuable food for thought.

One of the chief things that impressed me when I read the report is the fact that 164 of the 588 patients (27.88 per cent) investigated by the Social Service Department, were not entitled to receive services at reduced fees. While 588 cases is too small a number upon which to base definite conclusions, it becomes a very significant factor when considered from the viewpoint of health insurance. This 27.88 per cent may justly be considered chiselers, attempting to get something to which they are not entitled. It is interesting that this percentage of chiselers very closely corresponds to the abuse found in some of the European health services, and consequently, if and when any form of health insurance is adopted in this country, there must be added to the estimated cost 25 or 30 per cent to cover the abuse of privileges in one form or another.

While it appears that the fees received for much of the work is near or below the cost level to the doctor, the fact that these patients have been saved their self-respect and prevented from becoming patrons of public charity is of great value, for when a person once receives public charity in any form he is very apt to become a permanent dependent member of society and a supporter of the various types of "give me" legislation.

I believe that the doctors in Fresno County, in caring for this economically embarrassed group, are acting in accordance with the ideals of medicine, and will help many persons maintain their independent existence and pride of citizenship. Furthermore, such experiments definitely deny the accusation of many social economists who are claiming that the medical profession is giving no thought to, nor attempting to solve the problem of the unpredictable, indeterminable cost of illness.

⁂

Charles A. Dukes, M. D. (426 Seventeenth Street, Oakland).—The indigent, the near-indigent, and the patient who can pay a reasonable sum for medical and hospital care is the usual problem for every county in the care of the sick. When periods of depression appear the division between the indigent and near-indigent becomes very narrow.

I am doubtful of the wisdom of establishing a fee bill for the near-indigent, believing it is better to ascertain the financial status of each case and make the fee accordingly.

The distribution of the patients must be fair, and probably can be carried out geographically and alphabetically to the satisfaction of all. In Alameda County this plan of distribution of cases is being used.

Would it not be well to avoid the use of the title "Part-Pay Plan" and substitute "Medical Service" for work done for people of limited means?

FRACTURES OF BOTH BONES OF THE ARM OR LEG—THEIR MANAGEMENT*

By E. W. Cleary, M.D.
San Francisco

Discussion *by Arthur L. Fisher, M. D., San Francisco; Harold E. Crowe, M. D., Los Angeles; H. W. Spiers, M. D., Los Angeles.*

THE object of this paper is to discuss fractures of the forearm and leg bones from the viewpoint of the application of traction, and to present certain mechanical devices which have been found helpful in caring for such fractures.

The fracture problem has changed since the machine-age reached its heyday. The automobile has been characterized the greatest killer that man has yet invented. By the same token it leads the field in shattering, tearing, pulping and excessively contaminated injuries to the arms and legs. Such severe injuries are now produced at every corner and crossroads, and in the remotest regions where the automobile goes.

Changes in a problem predicate changes in methods for its solution. Every doctor now needs effective fracture equipment, which must include mechanical devices for traction and immobilization.

Certainly many cases of fracture may be effectively treated without the use of such mechanical devices, and should be so treated. The simplest effective method remains the method of choice. Some may deprecate the suggestion that an average doctor in an ordinary environment should use transfixion wire traction methods. It would appear, however, that the wide use of such methods, though not without hazard, would, on the whole, be less dangerous to the patient with severe complicated fractures, than the alternative of delayed or ineffective treatment.

IMPORTANCE OF EARLY REDUCTION AND EFFECTIVE IMMOBILIZATION

Reduction and effective immobilization at the earliest possible moment, particularly of compound or extensively comminuted fractures, are of signal importance. It was the French who, during the World War, emphasized the importance of early attention to dirty wounds by characterizing the first ten hours following the injury as the period of contamination, and the succeeding interval as the period of infection. Special effort should be made to complete cleansing, reduction and immobilization of compound fractures within the period before active infection has begun. Many, thus treated, get well with only an insignificant local reaction. Simple, easily available devices help to shorten the period of adjustment of the fracture, and to start it securely on the road to recovery before valuable time has been lost.

TRACTION IS INDISPENSABLE

Traction, in some form or other, is indispensable. Other things being equal, effectiveness of traction depends upon the method of application. Manual traction is sharply limited, is inexact and inconstant. Surface traction by means of mechanical devices is a step in advance sufficient to meet many needs. Maximum control and precision are attained by skeletal traction where the force is applied directly to bone at the points of traction and countertraction, and when both these points are hooked up to a rigid base of support.

The number and variety of rigid base traction devices is legion. Many new machines have recently appeared. Complexity and expensiveness tend to defeat the purpose of most of them. The desideratum is effective and inexpensive machines, convenient to carry and easy to set up, without elaborate mechanisms to get out of order; machines that are light and that get in the doctor's and the patient's way as little as may be.

Fig. 2.—*A*, self-tensing stirrups; *A'* hinge on bolt *P* and tense wire by tightening screw *M*; *BB'* retaining clamp, put on each end of wire; outside cast made snug to cast by bits of wet plaster bandage; stirrups off when cast hardens; *C*, transfixion wire traction on forearm; *D*, on the leg; bar not in the way of fluoroscopy; traction may be applied during operation. Entire assembly easily sterilized for operating.

AUTHOR'S TRACTION BAR AND TRACTION FRAME

Seeking such efficiency led the writer to devise a traction bar and a traction frame with some simple accessories. The previously devised appliances of so many men formed the background of the writer's efforts that it is not practicable in this limited time and space to mention their names. As the traction bar has been fully described in an article in California and Western Medicine for May, 1935, and as the frame has been illustrated and discussed in the April, 1935 number of the *Journal of Bone and Joint Surgery*, detailed description of these devices will be omitted here.

Traction Bar and Its Application for Closed Reductions.—This traction bar and its application for closed reductions is shown in Fig. 1. Through its use powerful traction may be temporarily applied. It holds the reduced fracture, while affording accessibility for fluoroscopy and for the application of plaster or other immobilizing splint. Short adhesive straps, holding the fingers flexed, are easily removed after plaster has been applied distally down to the wrist. The special ankle and knee straps will slip from under the ends of plaster extended far enough to temporarily hold the fractures. Plaster is extended proximally and distally after removal of these traction straps.

This bar may be hooked up for transfixion wire traction through self-tensing stirrups with bridles as shown in Fig. 2. After fluoroscopy or x-ray to check reduction, plaster should be applied, the wires supported in tension against the cast by clamps, and the bar and stirrups removed. The wire retaining clamp is a rectangular steel plate, 3/4 inch by 2 inches by 3/16 inch thick, slotted for the wire and provided with a wire-locking screw. The use of such clamps widely extends the field of usefulness of small transfixion wire because the clamps hold the wire under tension in the cast. We are all aware, I trust, of the limitations of fracture operating tables which do not put control of traction and rotation in the hands of the surgeon in his field of operation.

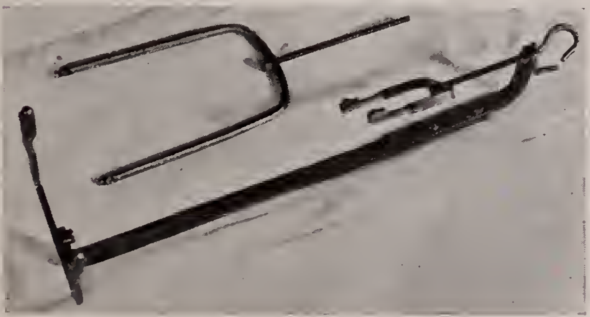

Fig. 3.—Special small traction bar and stirrups adapted for traction during operations.

The very small light traction bar, Fig. 3, is adapted for traction during operation only. It is useful when doing open reductions, correction of deformities or grafts for malunions. The device brings control of traction and rotation completely within the aseptic field of operation. It has also been helpful in open reductions of badly comminuted and displaced supracondylar fractures of the humerus involving the elbow joint. Special tension on wires is unnecessary for temporary traction during operation, provided stirrups of narrow span are used. The precision with which a fracture may be held by transfixion wires hooked up to this small bar is in pleasing contrast to the clumsiness and uncertainty of bone-holding or grasping forceps.

Traction Frame for More Difficult Fractures.—For the care of the most difficult fractures, the traction frame shown in Fig. 4 provides the desired mechanical aid, and does not get in the way so much or hit the pocketbook so hard as the heavier and more elaborate devices. Every range of adjustment in length, angulation or rotation that a fracture frame can deliver, using one wire for traction and another for countertraction, is practicable using this device. A high degree of lightness and adaptability has been obtained by using the simplest form of horseshoe stirrups, and making the proximal stirrup a part of the frame. The compression tongs, used to compress

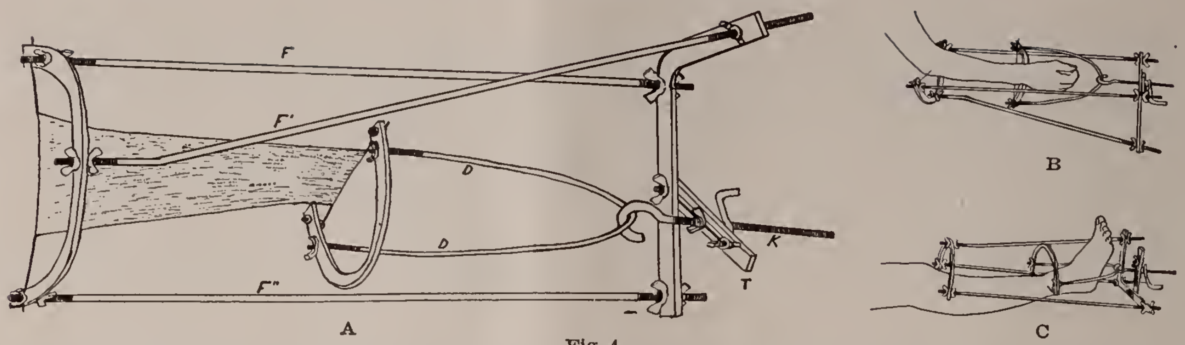

Fig. 4

Fig. 4.—*A*, traction frame. Note possibilities for adjustment: (1) At either ends of bars *F*, *F'*, *F"* and bridle *D*. (2) Radial and vertical by slotted post *T*. (3) Rotation by traction screw *K*. *B*, frame applied to fractures of forearm. *C*, frame applied to fractures of the leg.

the stirrup before hooking up to the wire, are shown in Fig. 5.

No two-wire system can completely control the distorting tendencies of unbalanced muscular and ligamentous stresses. When angulation due to such causes is discovered after a cast has been applied incorporating the transfixion wires under tension, the alignment is usually easy to correct either by simple wedging of the cast or by the use of a turnbuckle. Once only in the writer's experience, following wedging a cast three weeks after the wires had been put in, infection occurred at one end of one wire. In my opinion the change in stress on that wire allowed superficial infection on the surface to penetrate into the bone along the wire channel. Since this experience, we have avoided making any radical change in stress upon any wire that has been in place for any considerable time.

Use in Forearm Cases.—In forearm cases the proximal wire is usually put through the ulna about an inch below the tip of the olecranon. The lower wire enters the radius at a point at the junction of the flexor and radial surfaces about one and one-half inches proximal to the tip of the radial styloid, and is directed so as to emerge on the dorsal surface near the ulnar shaft. It does not interfere at all with rotation. The points of insertion and emergence are dressed with very small gauze squares slipped over the wires.

Fracture of Both Bones of the Forearm.—A fracture of both bones of the forearm, which was brought to the author ten days after injury, after the failure of many attempts at closed reduction and final failure of an elaborate effort at nonskeletal traction, is shown in Fig. 6. This fracture was reduced in the traction frame. The result is shown in Fig. 7.

Wire is much less likely to cause infection or ring sequestration than a large pin. Transfixion wire, which is too small, breaks. In one instance, .054 wire held for nearly eight weeks but broke before removal.

We now use .0625 oil-tempered spring steel wire and have had no trouble with breaking. Wires are cut from the stock of oil-tempered spring steel, using a Scholhorn type, compound leverage wire-cutting plier. A few strokes with a fine mill file provide a three-faceted trocar point which penetrates the hardest bone easily. A light mechanic's drill has been adapted for wires by extending the hole through the chuck and handle. No guide has been found necessary. Wire clamps, which hold the wire under tension against a cast, have greatly increased the adaptability of small transfixion wire.

IN CONCLUSION

It has been the intent to show that these simple mechanical devices for traction can be of great assistance in both closed and open reductions, and to, in a measure, "debunk" the idea that elaborate and expensive appliances are essential to transfixion wire traction. It is believed that

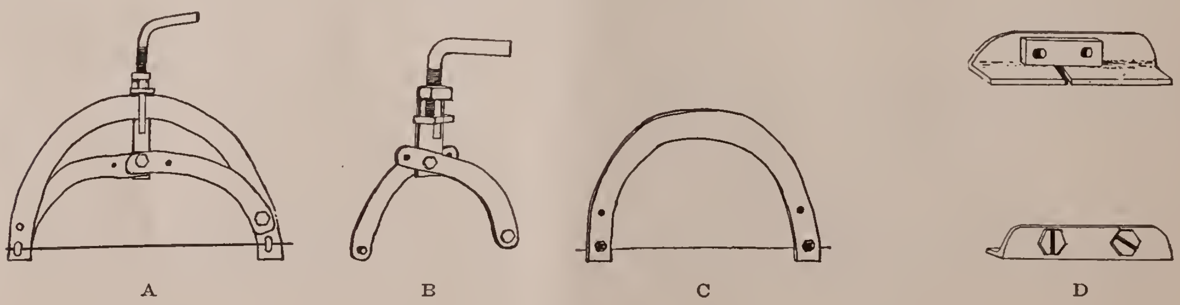

Fig. 5

Fig. 5.*—*A*, stirrup and compressor tongs. *B*, compressor tongs. *C*, stirrup tightened on wire, tongs removed. *D*, retaining clamp. After cast is on, a clamp is put on either end of each wire. Small bits of plaster bandage are used to make snug the bearing surface of clamp on cast. Stirrups may be removed as soon as cast hardens.

---

* The improved retaining clamp is not illustrated.

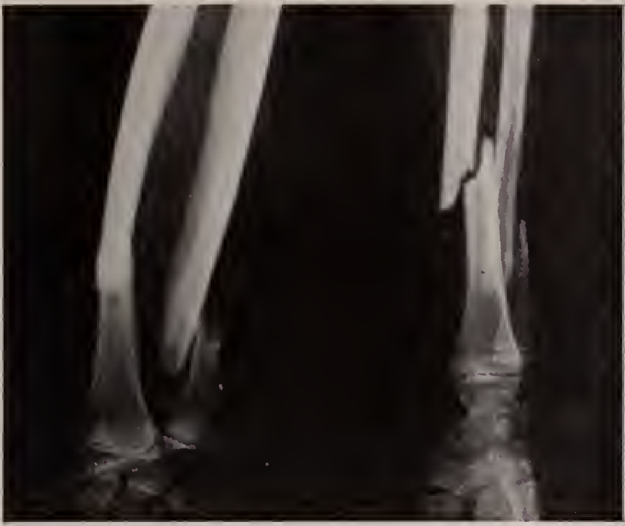

Fig. 6.—Fractures of forearm bones, ten days' duration, after repeated failure to secure reduction.

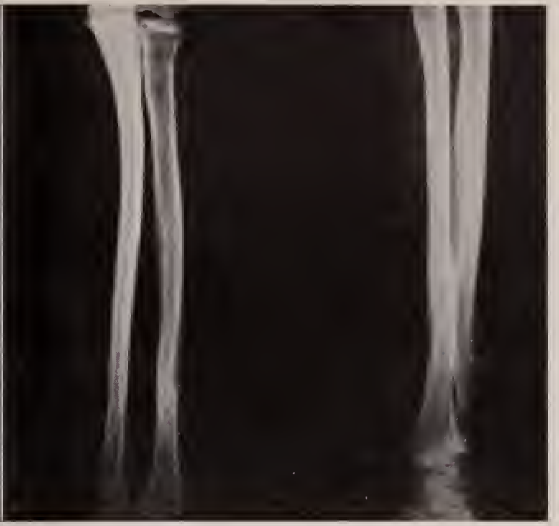

Fig. 7.—Result after reduction in the traction frame.

this effort is justifiable because difficult fracture problems occur wherever there are doctors, and because many doctors have been deterred from providing themselves with effective equipment due to expense, elaboration and mysterious difficulties which have been supposed to be attendant upon the use of skeletal traction, and particularly of small transfixion wire under tension.

The necessity for the exercise of discrimination and judgment in using skeletal traction is not minimized. Introduction of even the smallest wire compounds the fracture at that point, and the writer believes that no fracture should be compounded if it can be effectively dealt with by closed reduction. It is gratifying, therefore, in discussing skeletal traction at such length, to have presented also a device (the traction bar, Fig. 1) for facilitating closed reductions.

The devices presented have been a matter of gradual development and have undergone many changes. Doubtless they are still amenable to much improvement. Having found them helpful we hope that some others may find them worthwhile.

490 Post Street.

DISCUSSION

Arthur L. Fisher, M. D. (2000 Van Ness Avenue, San Francisco).—Whenever and wherever traction is necessary, the simpler the device the better. This apparatus of Doctor Cleary's is simple and has several features that seem to me to add to its utility. I was particularly struck by the bar that controls supination and pronation in cases of forearm fracture. This, I think, is a very great advantage. Many forearm and elbow fractures may be set with due regard to the position of the bones themselves, *i. e.,* getting end-on apposition, but with no regard paid to supination and pronation. In such cases frequently there is a pronation contracture by the time the fracture is healed.

I am not one of those who feel that every patient who has a fracture must be transfixed with pins in order that the fracture be well set. I think that at the present time there is too much transfixion of bones by means of pins, etc., and that too many surgeons take liberties with other people's bones.

There are instances, however, when this type of treatment is absolutely essential, and I think that this apparatus devised by Doctor Cleary is as good as any and, particularly for forearm fractures, is better than most devised. Its advantages consist in its lightness, its ease of applicability, and the facility with which changes in position can be made.

* * *

Harold E. Crowe, M. D. (2417 South Hope Street, Los Angeles).—It is a pleasure to discuss Doctor Cleary's paper regarding skeletal traction: first, because he has succeeded in simplifying and reducing the cost of apparatus for the application of transfixion-wire traction, and, second, because he has so generously admitted that this field should be open to the medical man faced with a difficult fracture, even though he may be located at the crossroads and not accustomed to call himself a specialist in bone surgery.

Experience with transfixion-wire traction has led me to believe that the introduction of wires is almost comparable to giving a hypodermic injection, since I have seen remarkably gross errors made while attempts at pin traction were in progress, without any unfortunate results. For instance, on several occasions as an attempt was made to introduce a wire through the distal end of the radius, I have seen the wire slip off the bone and shoot rapidly through the soft tissues of the wrist, where the multiplicity of tendon, nerve and blood-vessel structures is undoubtedly the uppermost thought in one's mind at such a time. None of these accidents have ever given any permanent injury or loss of function.

I feel that Doctor Cleary's suggestions are a definite contribution to the better general treatment of severe fractures.

* * *

H. W. Spiers, M. D. (614 Westlake Professional Building, Los Angeles).—The successful modern treatment of fractures of the forearm and lower leg requires accurate knowledge of the use of skeletal traction and countertraction. The value of skeletal methods of traction in these regions has only lately been widely appreciated. Numerous complicated pieces of apparatus are now being evaluated. Doctor Cleary's ingenious apparatus recommends itself because of its simplicity.

The fundamentals of fracture surgery are: First, reduce by traction and countertraction; second, place the distal fragment in line with the proximal fragment; and third, immobilize. The apparatus that Doctor Cleary has devised fulfills these fundamentals in an unusually simple manner.

One danger, I feel, should be emphasized. Methods of skeletal traction are not for the use of the tyro. Thorough knowledge of their use, abuse, and dangers are essentially for their successful application. Skeletal traction does not in itself reduce the fracture. It is the skill of the surgeon that reduces the fracture. This fact should not be lost sight of in any discussion of this subject.

⁂

Doctor Cleary (Closing).—I would like to say a further word about the selection of transfixion wire. I am not committed to the use of ordinary oil-tempered spring-steel wire, although we have found this metal practicable and effective for the average case. Some of the stainless-steel wires, while more expensive and not so easily handled in penetrating the bone, will not snap as the tempered wire sometimes does. I feel that the wire should be selected according to the magnitude and duration of the stress that it is expected to carry.

Doctors Fisher and Spiers have emphasized the technical and the limited application of skeletal traction. May we not fully agree with them, and yet face clearly the fact that modern conditions bring serious fracture problems with increasing frequency to a single ordinary doctor, who must assume the responsibility for treating the injury with which he is confronted. I believe that "be prepared" is a better sentiment for us to leave with a colleague who may face such a situation than "beware meddling."

SHOCK TREATED BY WARMED AIR

By Harold H. Hitchcock, M.D.
and
T. Eric Reynolds, M.D.
Oakland

Discussion *by Edmund Butler, M.D., San Francisco; C. D. Leake, Ph.D., San Francisco.*

Many useful inventions have come as a result of men with an inventive turn of mind getting into trouble. This is just as true in the field of medicine as with inventions in general. The apparatus which we wish to report came about in just such a way. The inventor was lying in bed in a rather extensive cast, which he found to be uncomfortable while it was drying. After he recovered, remembering his own experiences, he sought about for a method of facilitating drying and cutting down the degree and duration of such discomfort. The Sweetland cast-dryer is the result of that effort.

The apparatus consists, essentially, of a cabinet with electrical coils for heating, together with a blower which delivers this warmed air into flexible tubes (Fig. 1). These tubes fit, by means of simple coupling devices, into a coiled spring mat which can be laid on a bed or folded around a patient, as any ordinary blanket or mat would be (Fig. 2). The coiled springs are covered by fabric, which makes the whole unit into a flexible chamber or a flexible hollow wrapping, through which the heated air circulates, to leave by a vent at its distal end. The principal mat, which envelopes the body and legs, is augmented by an auxiliary mat, which can be fitted over an arm to which a separate pipe can deliver heated air. The amount of heat delivered is subject to simple regulation by means of switches, so that a greater or lesser degree of heat can be obtained, depending on the needs. This device is the invention of Mr. E. J. Sweetland, and it proved highly satisfactory for its original purpose as a cast-dryer.

Its success in alleviating the distress of a drying cast prompted us to extend its use to the treatment of patients in surgical and traumatic shock, irrespective of whether or not they were provided with a cast. An early opportunity came in an individual who presented a combined picture in that he developed shock soon after an operation for bone graft of the femur for an ununited compound fracture. While the other measures to combat shock were being put into operation, he was encased in a cast-dryer, which, in addition to helping his rather extensive cast to dry speedily, also provided him with quick, generalized heat. This is an important factor in recovery from shock.

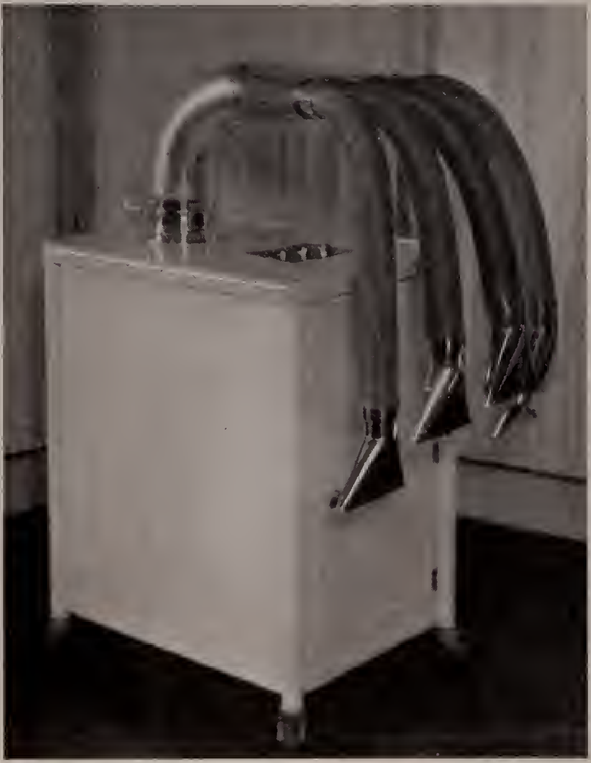

Fig. 1.—Warm air blower with flexible tubes.

Subsequently, the Sweetland apparatus was used by ourselves and our colleagues on various types of shock, including postpartum, postoperative, and posttraumatic shock. We have extended its use now to the prophylaxis of this condition by using the "cast dryer" whenever we have any reason to

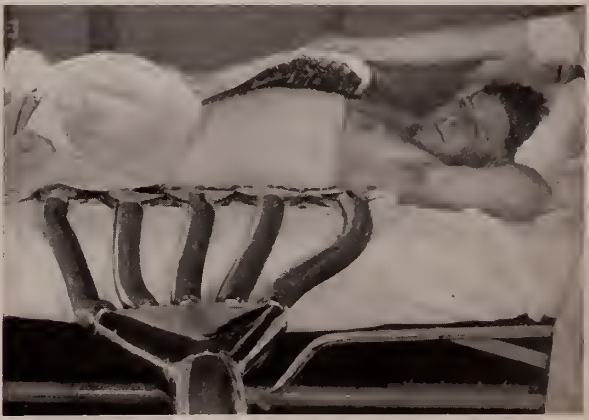

Fig. 2.—The cast is encircled by the mat.

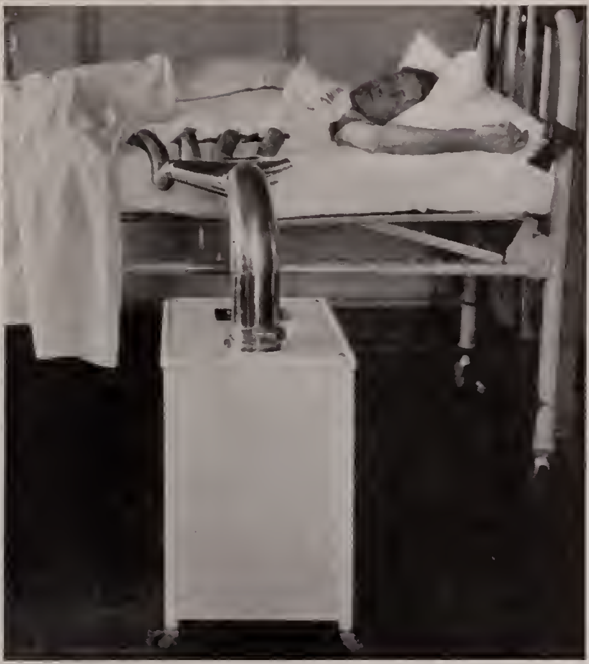

Fig. 3.—Assembly view of whole apparatus.

anticipate the possibility of shock. It is laid out in the patient's bed before he returns to it from surgery, and the bed is previously warmed thereby. As soon as the patient is in bed, it is used with the ordinary coverings and a moderate degree of heat kept up as long as necessary. It also subserves a very useful purpose in the treatment of individuals who are admitted into receiving and general hospitals in a state of shock from traffic and other accidents, as they can thus be warmed up in bed while an accurate diagnosis is being made.

1624 Franklin Street.

DISCUSSION

Edmund Butler, M. D. (490 Post Street, San Francisco).—The Sweetland cast-drier gives promise of being an excellent method of administering controlled heat. First, used as a bed warmer it must be very efficient. Not alone are one or two local areas heated by hot-water bags, as is the usual procedure, but the entire covering and the mattress would be thoroughly warmed. This, I feel, is a distinct advantage. Secondly, used as a means of administering heat to the patient, this again is most advantageous; but I am of the opinion that it must be controlled very carefully, and not too great or prolonged a temperature produced. A very severe type of shock may be the result of continued high temperature.

I wish to thank Doctors Hitchcock and Reynolds for bringing this method of heat administration to our attention.

⁂

C. D. Leake, Ph.D. (University of California Medical School, San Francisco).—Evidence exists that "shock" is related to outpouring of adrenin and subsequent exhaustion of the adrenals (P. K. Knoefel, Calif. and West. Med., 39:344, 1933). This offers a probable explanation of the fall in temperature in "shock." Sparing the adrenals by supplying heat in this situation is thus rationalized, and certainly experience has abundantly justified the procedure. The method of providing heat described by Doctors Hitchcock and Reynolds is an ingenious, easily controllable, and highly effective one. Its use, as so succinctly indicated by them, should be very helpful, especially when available for emergencies.

BIOPSY IN MALIGNANT DISEASE*

By Otto H. Pflueger, M.D.
and
W. P. Stowe, M.D.
San Francisco

Discussion *by Emile Holman, M.D., San Francisco; Orville N. Meland, M.D., Los Angeles; George S. Sharp, M.D., Pasadena.*

As a result of intensive propaganda by the medical profession, patients with malignant disease are presenting themselves for care earlier than in past years. We are seeing, therefore, many more lumps of the breast, neck, subcutaneous tissue, etc., than we did, in which the diagnosis is neither obvious nor easy to make without direct examination of the entire tumor or a portion of it. Furthermore, even though one may make a correct clinical diagnosis, it is desirable to know the type of tumor with which one is dealing—its histologic picture, its probable response to irradiation, and its likelihood of recurrence. These things are important, and all available knowledge should be had concerning a tumor before treatment is undertaken. Pathologic examination is also necessary for the completion of our records, for only by such means can we evaluate any form of treatment three to five years later. This is especially true in those cases in which surgery is not contemplated and treatment is entirely by irradiation.

We feel, therefore, that a short discussion of the question of biopsy will not be amiss before this section of men who are largely responsible for the obtaining of tissue for examination. A knowledge of the indications and contraindications, and of the correct technique for obtaining a biopsy specimen, is of great practical importance in the treatment as well as in the diagnosis of malignant conditions.

We are not concerned in this paper with the procuring of a specimen from an ulcerated surface lesion. One can remove a small portion of tissue from the edge of such a lesion with a biopsy forceps with a reasonable assurance that no harm is being done. By means of an endotherm loop one has the possible added safety of control of hemorrhage and the questionable sealing of lymphatics. If this instrument is lacking, one need not, however, hesitate in taking a small piece from the edge in the ordinary manner, with as little trauma as possible.

DETERMINING THE NATURE OF THE TUMOR

What does concern us is how, with the least possible harm to the patient, we are to determine the nature of a tumor which arises beneath the surface of an unbroken skin. Properly performed, such biopsy will not decrease the patient's chance of cure, and will aid in outlining proper treatment. Three methods are available in cases of this type:

---

Read before the General Surgery Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13 to 16, 1935.

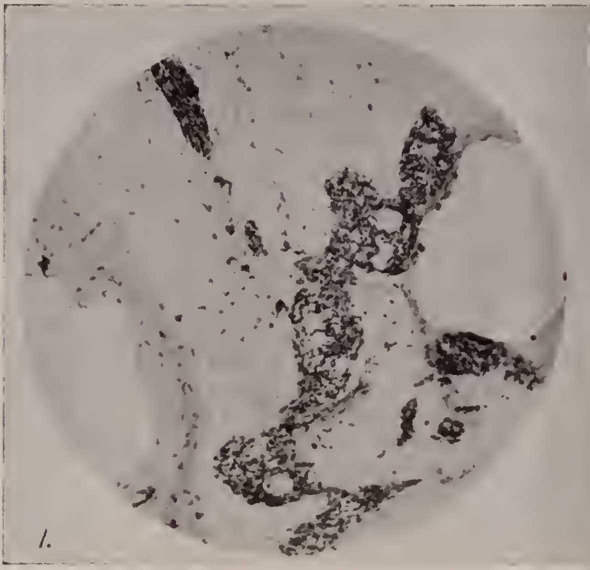

Fig. 1

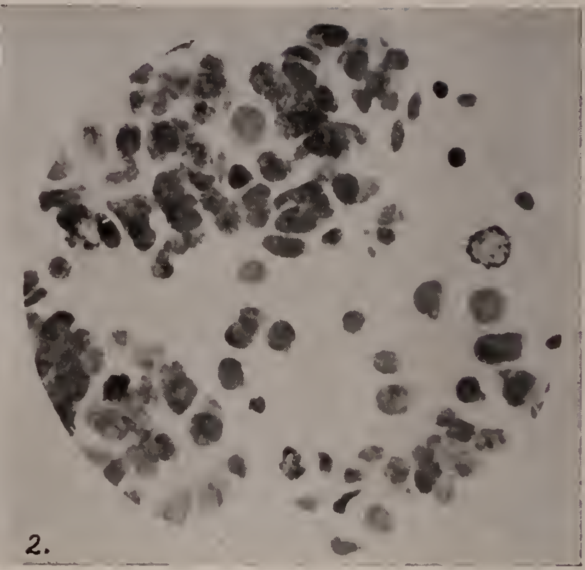

Fig. 2

Fig. 1.—Mixed tumor of parotid x 125. Loose myxoma tissue with nests of epithelial cells.
Fig. 2.—Carcinoma of parotid x 640. Irregularity of cell size and shape with three mitotic figures.

1. Incision directly into the tumor for observation of gross tissue, or removal of a portion for microscopic study.

2. Removal of the entire lump with a wide margin of normal tissue.

3. Aspiration of a small bit of tissue through an ordinary needle. With the last, one might mention such special instruments as the Hoffman punch,[1] but the mere simplicity of ordinary needle puncture and aspiration, requiring no unusual equipment, makes it the most readily available for this type of biopsy.

INCISION INTO THE TUMOR

Incision into a tumor, to observe its gross appearance or to procure a specimen, is undesirable and should be avoided when possible, because tumor cells may be implanted into normal tissue and a large number of blood and lymph channels are opened. Ewing especially feels that incision into a tumor alters the clinical setting by breaking down the natural local barriers, and favors early metastasis. The introduction of infection into a tumor, and the fungation of tumor tissue through the wound in the skin, are other possible complications. The latter is especially so in growths where the tumor tissue is under tension either because of the nature of the tumor—as in myxomas—or because of secondary necrosis. Bone tumors, also, are especially likely to fungate through a biopsy incision. Probably nothing which may occur in the course of a tumor's growth so alters

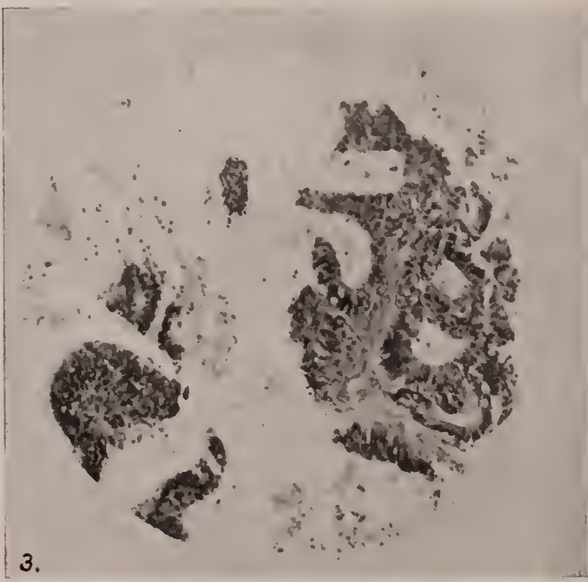

Fig. 3

Fig. 6.—Adenocarcinoma of breast x 640. Shows irregular cell and nuclear size and pattern. One cell with four large hyperchromatic nuclei; one with two.

its clinical picture, and behavior and response to treatment, as does infection. Scrupulous care is needed to avoid it.

There are, however, instances when incision into the tumor for diagnosis is necessary. When this is so, a definite routine should be planned beforehand. Facilities for immediate diagnosis should be available, and the treatment indicated carried out at once. While we are not concerned here with treatment, the procedure of biopsy cannot be divorced from it. For instance, many surgeons transect a tumor of the breast to observe the cut surface for diagnosis. If carcinoma, the radical operation should be performed at once, after cauterization of the wound, and change of drapes, gloves, and instruments. It is a safer procedure to excise the lump widely, not cutting into it until it has been entirely removed. In biopsies of bone tumors everything should be ready for radical operation immediately if indicated. If a frozen section diagnosis at the operating table is not possible, the wound should be carefully closed, and x-ray treatment given in the interval it takes to arrive at a definite diagnosis. The Bone Sarcoma Registry contains cases well after five years in which some days elapsed after biopsy before radical treatment was instituted.

For perfectly obvious reasons biopsy is always indicated for confirmation of clinical diagnosis before such a radical procedure as amputation is undertaken. Such biopsy should be preceded by irradiation. X-ray treatment should also precede biopsy on soft tissue tumors to reduce the likelihood of metastasis, and to observe the effect of irradiation. In large lymph-node tumors, such as Hodgkin's disease or lymphosarcoma, it is preferable to take for biopsy a free node at the side of the bulky tumor, even though this gland may not always show a complete picture of the process. Where interstitial irradiation—that is, conservative treatment of metastatic glands—is the practice, the nodes may be exposed, a biopsy taken, and radon seeds or element needles immediately inserted into the gland which makes a good holder for the needles. Indiscriminate cutting into any lump which one may find is poor surgery, and poor cancer treatment, and should be condemned.

EXCISION OF TUMOR

Wide excision of a tumor for histologic examination is the procedure of choice whenever possible. This may not be feasible nor possible in large tumors. We prefer local excision of a small lump in the breast to incision into it. The Cancer Commission of the California Medical Association,[2] in its report on breast tumors, recommends local removal of a doubtful tumor, unless cancer is obvious at the first approach. To be sure, rough handling of the tumor and surrounding tissues may make for the situation we are trying to avoid, namely, the spreading of the disease, but all of us are aware of the delicacy that must be employed in the surgery of any neoplastic tissue. This procedure is of advantage also in that it yields the whole tumor for examination. Another reason for preference of local excision is that if the tumor proves to be benign, the operation has been completed and one need only close the wound.

There is another field where wide local excision is not only feasible but urged upon you, and that is in the case of the small subcutaneous tumor. The serious nature of these tumors is frequently overlooked. Many are sarcomata, and it is possible only by examination of the tissue under the microscope to distinguish between the benign fibroma or neurofibroma and the small sarcoma. These small sarcomata are peculiarly prone to recur. To incise one for diagnosis is, therefore, foolhardy, and equally so is its simple enucleation. Wide removal constitutes adequate surgery, gives one the entire tumor for examination, and is a safer procedure. To quote from another report of the Cancer Commission:[3] "Biopsy for small lumps is condemned. Excision is safer, certain, and not more difficult, and lends itself to a more thorough study of the whole tumor microscopically."

ASPIRATION BIOPSY

We prefer aspiration of a tumor to incision into it, for the purpose of obtaining material for histologic examination. There is definite indication for it in those tumors beneath the skin where complete removal of the lump is not feasible for adequate reasons, and where, ordinarily, incisional biopsy is done. It should also be used in those cases where irradiation is the best method of treatment in order to give us a histologic record for evaluation of the treatment, at the same time avoiding a surgical procedure in the operating room in obtaining this tissue. Furthermore, irradiation has less effect upon a tumor which has been incised and where fibrosis is present. Aspiration avoids the necessity for incision, and its disadvantages.

The method is not new, but for some reason it has not been utilized to the fullest extent of its possibilities. Within recent years it has been used largely at Memorial Hospital in New York; and papers by Martin and Ellis,[4,5] Coley and Sharp,[6] Sharp,[7] and by Ferguson,[8] have shown its value in various clinical varieties of growths. Tumors of cervical nodes, metastatic and primary; parotid and submaxillary glands; intra-oral tumors with nonulcerated mucous membrane; breast, bone, thyroid, lung, prostate, and soft tissue, have been diagnosed by this method. Recently, Stewart,[9] at the same institution, has reported on the pathologic interpretation of the material so obtained in 2,500 cases. No untoward results were noted in any of the cases as a result of the procedure.

The method used to obtain the tissue is that recently fully described by Martin and Ellis [4] in their paper published in 1934. It consists briefly in advancing an 18-gauge needle, attached to a tightly fitting record syringe, into the tumor through a stab wound in the skin made after injection of a little novocain. After the needle has entered the tumor, negative pressure is made within the syringe, and this is maintained continuously until one is ready to withdraw the needle. The needle is advanced in the tumor, withdrawn the same distance, again advanced at a slightly different angle, withdrawn an equal distance; the vacuum in the syringe is slowly reduced; the syringe detached and the needle separately withdrawn. The material in the needle is ejected onto a slide, crushed between two slides, air-dried, slightly flame-fixed, and then flooded with absolute alcohol for about two minutes to fix more firmly to the slide. Then it is washed in water; stained with hematoxylin (our preference is five to ten minutes in Mayer's hemalum); washed; mordanted in tap water for five minutes and stepped up through eosin in 95 per cent alcohol; two changes of absolute alcohol; carbolyxlol; hylol; and mounted with Canada balsam.

Resultant cell groups are searched for with low power, and analyzed with high power for arrangement—often typical—hyperchromatism, atypical structure or architecture; cell irregularity in size or nuclear pattern, and mitotic or amitotic division figures. There must be kept in mind that the aspiration picture will overemphasize the softer and more cellular structures, the fibrotic, hard, resistant tissues being less included in the needle specimen.

At times, no tumor cells are present in the smear. This occurs if the technique is faulty; at times, with correct technique, if the tumor is hard and fibrous; or when the mass is cystic or inflammatory rather than neoplastic. One elderly woman had a large cystic tumor of the maxilla with pressure bone erosion, which was considered as a possible adamantinoma. The material aspirated showed no tumor cells, only pus and inflammatory cells. At operation a large, smooth, thick-walled cyst was easily removed, which on section was entirely inflammatory. Tuberculosis of cervical glands was diagnosed in another case, and in another a liver mass was found to be actinomycosis.

That aspiration biopsy has certain drawbacks, no one can deny. These lie chiefly in the finer pathologic interpretations. The various types of cancer of a particular organ usually cannot be differentiated, nor can one always grade a tumor and so determine its probable response to irradiation. Coarser differentiations, however, are possible. For instance, in material aspirated from cervical nodes one may see squamous pearls, or one may find the sheets of cells characteristic of the transitional cell type, and so know what type of treatment is indicated. We have so done in our own series, with the transitional type completely disappearing under x-ray treatment. What one is diagnosing is usually a smear of tissue, unless one obtains enough material for paraffin section. Cell relations are largely lost, as are the relations of the whole tumor to the surrounding tissue. But neither do we have this latter information when a small piece of tissue is removed through an incision, and that is what most surgical biopsies consist of.

It must be emphasized that the method is not one for academic detachment. The pathologist and the clinical surgeon must sit down together with their completed slides and consider all aspects of region and tissue involved, and the clinical aspects of the case. Then, out of their combined efforts they must try to formulate a diagnosis. Many times the resultant will be definite as to type and malignancy; many times definite as to malignancy, but not type, and many times it will be, in honesty, "indeterminate." In these cases no chagrin need be felt, as the patient has not been harmed and the traditional methods can then be employed.

The essential training in learning this method is to needle every routine tumor received in the laboratory and then compare these preparations with the tissue sections until some wisdom is attained in their interpretation.

Mention of a few locations in which aspiration is feasible and has helped us is probably the best way of demonstrating its value. It can be used in doubtful tumors of the breast. It is especially valuable in those cases which turn out to be cancer, because then the indicated treatment can be carried out with the least previous interference. If benign, the patient can be reassured with little loss of time. Also cases may be quite obviously cancer, but for some constitutional or other reason treatment must be entirely by irradiation. It is important to have histologic proof for record, which can be obtained very easily by aspiration. Bone tumors, especially liable to fungate through biopsy wounds, can be diagnosed as to their general nature by aspiration when the cortex is sufficiently eroded to allow penetration of the needle. The same applies to antrum tumors. Coley and Sharp[6] have reported success in aspiration of bone tumors in a high percentage of cases, occasionally having a diagnosis only of malignant tumor cells, but most often a definite diagnosis as to type.

The differential diagnosis of cervical tumors is frequently difficult, and especially so if no primary lesion is found to account for metastasis. The first indication of a large percentage of pharyngeal or tonsillar lesions is an enlargement of cervical glands. Aspiration will most often make the diagnosis of the condition in the nodes; at least it will give strong presumptive evidence as to the nature of the condition. Presumptive evidence is usually all that is possible in Hodgkin's disease and lymphosarcoma. We have repeatedly made correct diagnoses in cases of metastatic glands, and have at times ruled it out by finding an inflammatory condition. If necrotic material is obtained, it may be due to an inflammatory condition, such as tuberculosis, or to broken-down carcinoma. The latter occurs frequently if irradiation has been previously given, but one can usually find cells which are undoubtedly of a malignant nature. Aspiration is attended with much less interference than the removal of such a gland.

It is impossible to consider all types of tumors and locations in which aspiration is of value. As mentioned, it can be used in cases where an incision into the tumor would ordinarily be made. Reference to the figures will show some of the material we have obtained by aspiration, and the microscopic picture of the same.

CONCLUSIONS

1. To know the indications for biopsy is a need of every individual who treats neoplastic diseases.

2. Surgical incision into a tumor should be avoided, and can be avoided in most instances.

3. Wide excision of a tumor for diagnosis is the best means of obtaining tissue for examination whenever feasible.

4. Aspiration through needle puncture *is* a sensible means of biopsy, and will give a tissue diagnosis in most instances.

DISCUSSION

Emile Holman, M. D. (Stanford University Medical School, San Francisco).—There can be no question that biopsy upon suspected malignant disease is more frequently necessary at the present time than in former days, when patients consulted a physician for cancerous lesions recognizable as such on inspection alone. In performing such biopsies it is most necessary to bear in mind the potential dangers inherent in the procedure. The division or rupture of blood and lymphatic vessels within a malignant tumor inevitably conditions the possibility of cancer cells being carried off into the blood or lymphatic systems to be deposited elsewhere beyond the surgeon's reach.

In the course of a recent operation for a questionably malignant tumor of the breast, the mass was transected and observed to be cancer; then the cut surfaces were cauterized with phenol and the incision closed. An immediate radical mastectomy was performed. Microscopic examination of the axillary nodes revealed whole fresh blood cells in the lymph sinuses within the glands. These undoubtedly had their origin from the cut surfaces of the first incision. The interval between the incision and the removal of the nodes was approximately sixty minutes. There is no reason why cancer cells could not be equally quickly transported from tumor to lymph sinus. The lesson is obvious. No biopsy should be undertaken that is not followed immediately by the proper treatment, whether it be surgery or radiation therapy.

Aspiration biopsy requires special training in the interpretation of the material obtained, and should not be undertaken unless such experience in interpretation has previously been available. Given the essential equipment and a properly trained pathologist, the aspiration biopsy should have a wider field of usefulness.

Transection of the tumor for inspection of the cut surface should be reserved only for lesions that are not easily enucleable. Where possible, complete excision of the tumor, as in small lesions of the breast, is the most desirable method of obtaining a specimen, the character of which will determine the subsequent course of the operation or treatment.

⁂

Orville N. Meland, M. D. (1407 South Hope Street, Los Angeles).—Despite all our efforts in the refinements of diagnosis of tumors, we are still dependent upon biopsy.

In the final analysis, it is only by microscopic examination of the suspected tissue itself that one is able to make a definite diagnosis of a benign or a malignant condition. From a theoretical standpoint, there is always a possibility of dissemination when a biopsy is done, but the possible harm is much less than the good it accomplishes for the patient. However, when done, suitable treatment should be carried out immediately so as to lessen such a danger; this is especially true where the surgeon must cut through normal tissue to reach the suspected lesion.

Within the last few years the use of aspiration biopsy has come to the front. It is particularly useful where the treatment is to be radiological, rather than surgical; but even where surgery is contemplated after preoperative radiation, it is advisable, as it not only makes a definite diagnosis possible, but it acts as a guide in establishing some criterion as to the amount of therapy that should be given.

These are the advantages, but there are certain disadvantages also. When positive the method is excellent, but where the aspiration is negative it means little one way or the other. For instance, in suspected Hodgkin's and lymphosarcoma it is to be condemned, for even when an entire node is removed the pathologist may have difficulty in arriving at a correct conclusion; so, wherever feasible, the regulation method of biopsy is preferable.

It is very commendable of Doctor Pflueger to focus our attention on biopsy again. Whatever progress we hope to make in the early recognition of cancer must necessarily be along these lines. The method of doing a biopsy is of secondary interest; it is the interpretation of the tissue that is of paramount importance.

⁂

George S. Sharp, M. D. (605 Professional Building, Pasadena).—We have heard a complete treatise on the subject of biopsy, and only certain statements that Doctors Pflueger and Stowe have made need emphasis.

The preliminary working diagnosis should be based primarily on a thorough history and complete physical examination. Special examinations, such as transillumination, are important diagnostic procedures, and should always be performed when of advantage for the most accurate clinical impression. Information gained from the above examinations should enable the physician to determine the correct diagnosis in at least 85 per cent of the patients.

Pathological confirmation of the diagnosis is desirable many times before treatment is started, when the clinical findings are not definite. Frequently a radiation program is planned, or preoperative x-ray therapy is advisable, and a pathologic report is most necessary for the tissue structure and degree of anaplasia. The proper dosages of radiation must be based on this microscopic study.

The aspiration biopsy is of great value for the above material in certain cases. By this procedure, a tissue examination is possible without risk (Ewing, Stewart) and without loss of time and wound healing, and it is a procedure that may be performed without hospitalization or delay. The aspiration biopsy may be used for many ulcerated tumors. This procedure is used regularly for locating and identifying intracranial tumors. I have found the procedure of very definite value in identifying metastatic lymph nodes, tumors in the upper lobe of the lungs, or those located well out in the parenchyma, beyond the reach of the bronchoscope. Complete differentiation cannot always be made upon the smear, but the question of malignancy can be settled. This type of tissue study does not make it possible to differentiate between the different members of the lymphoblastoma group and Hodgkin's disease.

The reason for this discussion, I believe, is to condemn the hasty operation for diagnosis, and to replace it with a more complete and effective program which is based on the complete clinical findings (with a possible aspiration diagnosis) in order that no step in the attack against a malignant growth is omitted.

THE LURE OF MEDICAL HISTORY†

QUACKERY AND NATUROPATHIC LOGIC IN 1795–1825

By Harold M. F. Behneman, M.D.
San Francisco

REMEMBERING that, in the year 1934, the electorate of California were called upon to vote on the Naturopathic initiative (No. 9), it is interesting to review the same unscientific concepts and biased logic which existed one hundred and fifty years ago.

CULTIST SAMUEL THOMSON'S BOOK: THE "NEW GUIDE TO HEALTH; OR, BOTANIC FAMILY PHYSICIAN"

On February 9, 1769, one Samuel Thomson was born, to later become an outstanding cultist in the State of Massachusetts. In the fifty-third year of his life, and in the forty-seventh year of American Independence, he persuaded one Horton Howard of Columbus to publish a volume of one hundred and twenty pages entitled, "New Guide to Health; or, Botanic Family Physician."

By 1827, this book had run through four editions. Like the majority of modern cultist publications, it divided its contents into two main parts—first, the experience and theories of its author, and, secondly, the usual attack upon the medical profession. We learn that the tendency of lay practitioners today to sell, patent or copyright their wares, is at least a century and a half old.

On page 1 of his book, Mr. Thomson reveals his true colors as a cultist in the following utterance, so characteristic of an unscientific mind, devoid of knowledge concerning the fundamental elements of Hippocratic medicine, stating his "Agreement," frequently italicized by himself: "The subscriber, who is the discoverer and proprietor of the system of medical practice contained in this work, agrees to give, whenever applied to, any information, that shall be necessary to give a complete understanding of the obtaining, preparing and using all such vegetables as are made use of in said system, *to all those who purchase the right;* and the purchasers, in consideration of the above information and also what is contained in this book, agree, *in the spirit of mutual interest and honor, not to reveal any part of said information, to any person except those who purchase the right,* to the injury of the proprietor, under the penalty of forfeiting their word and honor, *and all right to use of the medicine.* And every person who purchases the right, is to be considered a member of the Friendly Botanic Society, and entitled to free intercourse with the member for information and friendly assistance."

---

† A Twenty-five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

To further prevent humanity and science from stealing his thunder, he had John W. Davis, clerk of the Massachusetts District, in 1822, file copyright claims to the title *and contents* of his book.

HOW CULTISTS REPEAT THEMSELVES

In the "Introduction," his defense of his methods, and his opening attack upon doctors of medicine, reveal his inferiority complex. Today, in the chaos of our times, we recognize the tendency of cultists to depend upon one or a few modes of therapy for a wide variety of conditions. All we need do, in proof of this, is to peruse the newspaper advertisements of the quack, the charlatan and the parasites that prey upon honest medicine. It is an old story, for here we find over a century ago Mr. Thomson's statement:

> "If, then, a medicine is good in any case, it is because it is agreeable to nature, or this principle of life, the very opposite of disease. *If it is agreeable in one case, it must be absolutely so in all.*" (Italics by this author.)

Does not this resemble a modern advertisement of the colonic irrigationist, et al?

After informing the countryside of the magic healing power of vegetables, he states:

> "This greatly disturbed the learned doctors, and some of them undertook to destroy me, by reporting that I used poison: though they made no mention of my using their instruments of death, mercury, opium, ratsbane, nitre and the Lancet."

In combating the forces which seek to menace the public health standards so sanely and patiently built up by scientific medicine, we might consider, at least for its immediate effectiveness, the adoption of methods used by the physicians of Massachusetts in 1800! For, as Mr. Thomson states:

> "A plan was once laid to take me in the night, but I escaped . . . next, I was bound in irons and thrust into prison, to be kept there through the winter without being allowed bail."

A DESCRIPTION OF SEVERAL CASES OF DISEASE ATTENDED BY THE AUTHOR, WITH THE MODE OF TREATMENT AND CURE.

FOURTH EDITION.

BY SAMUEL THOMSON.

Columbus:

PRINTED AND PUBLISHED BY HORTON HOWARD.

1827.

Fig. 2.—Title page of the "New Guide to Health," published in Ohio in 1827.

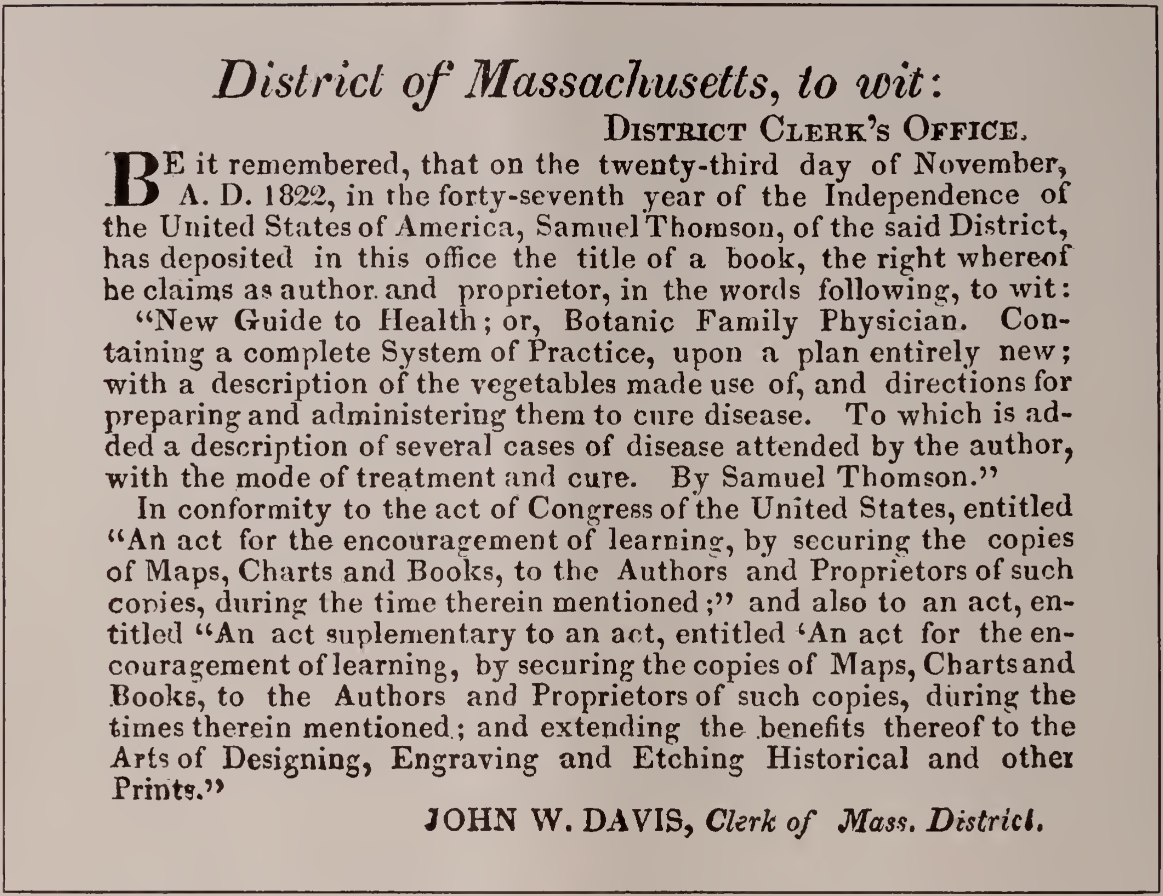
How analogous to the modern cultist's high pressure sales talk is this:

> "The practice of the regular physicians, that is, those who get a diploma, at the present time, is not to use those means which would be most likely to cure disease; but to try experiments upon what they have read in books, and to see how much a patient can bear without producing death. After pursuing this plan during their lives, they know just about as much as they did when they began to practice. . . ."

SIMILARITY TO MODERN CULTIST ADVERTISING

In the light of modern cultist advertising, however, the *pièce de resistance* of Mr. Thomson's essay is the final paragraph of his introduction; to wit: "There is . . . one general cause of disease and one general remedy."

If we close our eyes a moment and visualize the present tactics of the cultist, we can, with



District of Massachusetts, to wit:

DISTRICT CLERK'S OFFICE.

BE it remembered, that on the twenty-third day of November, A. D. 1822, in the forty-seventh year of the Independence of the United States of America, Samuel Thomson, of the said District, has deposited in this office the title of a book, the right whereof he claims as author and proprietor, in the words following, to wit:

"New Guide to Health; or, Botanic Family Physician. Containing a complete System of Practice, upon a plan entirely new; with a description of the vegetables made use of, and directions for preparing and administering them to cure disease. To which is added a description of several cases of disease attended by the author, with the mode of treatment and cure. By Samuel Thomson."

In conformity to the act of Congress of the United States, entitled "An act for the encouragement of learning, by securing the copies of Maps, Charts and Books, to the Authors and Proprietors of such copies, during the time therein mentioned;" and also to an act, entitled "An act suplementary to an act, entitled 'An act for the encouragement of learning, by securing the copies of Maps, Charts and Books, to the Authors and Proprietors of such copies, during the times therein mentioned; and extending the benefits thereof to the Arts of Designing, Engraving and Etching Historical and other Prints."

JOHN W. DAVIS, *Clerk of Mass. District.*

Fig. 3.—Photograph of notice of copyright of title of his book, granted by the District of Massachusetts, November 23, 1822.

amazing reality, transplant intact this paragraph, written one hundred and twelve years ago, into 1934; for it smacks of the faddist's sales talk:

> "The practice of giving poison as a medicine, which is so common among the medical faculty at the present day, is of the utmost importance to the public; and is a subject that I wish to bring home to the serious consideration of the whole body of the people of this country, and enforce in the strongest manner on their minds the pernicious consequences that have happened, and are daily taking place by reason of giving mercury, arsenic, nitre, opium and other deadly poisons to cure disease."

Later, in this same book, his "New Guide to Health," the author deals a severe blow to our conception of the importance of "bedside manner," personality, etc. Unintentionally, probably, he classifies all physicians into two groups, skillful ones and fools; for he writes: ". . . for poison given to the sick by a person of the greatest skill will have exactly the same effect as it would if given by a fool." What a fitting phrase that would be for the title page of a pharmacology textbook!

Most of us, in the practice of medicine, have heard facetious remarks from patients, such as "It's fashionable to have your tonsils (or appendix) out." It is not new, for in 1822 the botanist wrote: ". . . the doctors have no system . . . almost every great man among them has had a system of his own, which has been followed by their adherents till some other one is brought forward more fashionable."

Mr. Thomson, in a matter of one hundred pages, lists the vegetables, herbs and remedies he considers of value. Their origin, their characteristics and their uses are minutely recorded. The diseases for which they are specific are also named, as well as the manner in which they must be used. Those of us who unfortunately tune in on some so-called medical and health talks over the air soon learn from the nauseating misinformation that the majority of "regular speakers" use numbers for drugs or their combinations, such as "take my powder No. 4 for ulcers, No. 11 for sinus trouble, etc." Alas, even this is not new! Mr. Thomson has all of his drugs, potions, mixtures and remedies numbered. And what is more, he advises for "ague in the face . . . a dose of tea No. 3, a dram of No. 6 . . . then tie a small quantity of No. 2 in a fine piece of cloth, wet with No. 6 . . ." etc., etc.

THOMSON'S CLASSIFICATION OF REMEDIAL AGENTS

Of the maze of diseases and remedies, all of the latter seem to fall into two classes: those which he has found to succeed, and those that have failed. His reasoning is remarkably modern, in relation to the quack and charlatan of 1934; in other words, when a cure was effected the medicine did it, but when a failure came, he had numerous excuses to give for it. As in the present field of physical medicine which the laity uses extensively without legal or moral curb, some of the modalities are bound to help—the majority of all sick people feel better, at least temporarily, if they have heat, massage, hydrotherapy, rest exercise, etc. And in the minority of cases that fail to improve, the quack has a ready excuse. Here in this eighteenth century volume are two perfect examples of such reasoning.

The first is one of Samuel Thomson's prized remedies. Of it he says: "In fact, there is hardly a complaint, in which this useful medicine cannot be used to advantage." It is listed as "No. 6—Rheumatic Drops." Gaze upon the compound and you will see that enough of this mixture will easily have one so alcoholic that mere pain, as well as other things, will not matter! The treatment is as follows: "One gallon fourth proof brandy, one pound of gum myrrh, one ounce of cayenne pepper. Boil a few minutes or let stand six days." Mr. Thomson states there are two uses for this unfailing remedy: "To remove pain and *prevent mortification.*" (Here, the italics are mine.) In fact, if I am not mistaken, most pathological laboratories are still immersing human tissue in alcohol "to prevent mortification."

And now, to the other extreme, Mr. Thomson's remedy for "cancers of the breast." He writes:

> "One of them was as large as a half-peck measure and grew fast to the breast bone. I carried the woman through a course of medicine several times, and applied a poultice of butternut shucks . . . and continued this course for some months, until the bunch had more than half dissolved and had grown off from the bone . . . but she was *taken with a fever in my absence and died.* The other two . . . nature was *too far exhausted* to *complete* a cure." (Again, the italics are mine.)

At times, it appears that Mr. Thomson had some leanings toward faith healing, for he admits the presence of parasites in the body, but refuses to acknowledge the fact of their pathogenicity:

> "A great deal is said about worms causing disease. There was never a greater absurdity than . . . the opinion about worms causing disease. The fact is they are created and exist in the stomach and bowels for a useful purpose and are friendly to health . . . they never cause disease, but are caused by it. Those who are in health are never troubled with worms, because they are then quiet and exist in their natural element."

THOMSON'S CONCEPT OF PHYSIOLOGY

The botanist-author was adept at forming strange conclusions to fit his own theories of physiology, to wit:

> "When the stomach is diseased . . . the worms try to flee from their danger . . . and they sometimes get into knots and stop the passage to the stomach. Much more might be said on . . . the dangerous practice of giving medicine to kill worms."

Concerning consumption, Mr. Thomson feels that the doctors are grossly in error when "This complaint is called . . . a hectic fever . . . for there is no fever about it . . . the only difficulty is to raise a fever."

Down through the ages have come five metals that scientific medicine still uses for syphilis and anemia. Of these five the ancient cultist has this to say:

> "Avoid all minerals used as medicine, such as mercury, arsenic, antimony . . . copper or lead. They are all poison and deadly enemies to health."

One of the author's firm beliefs is:

> "The medicine necessary to remove the complaint must be applied to that part where the disease is seated; if in the stomach only, by taking the medicine, it may be removed; but if in the bowels the same compound must be administered by injection . . . as the grand object is to warm the bowels."

THOMSON'S FAMILY MEDICINE CHEST

There was little need of a drug code in the days of Samuel Thomson. If his ideas had been widely accepted, but few drug stores could have existed, for here is his entire stock of medicine for a family for *twelve months:*

"Stock of Medicine for a Family.

1 Oz. emetic herb
2 Oz. cayenne
½ Lb. bayberry root bark
1 Lb. poplar bark
1 Lb. ginger
1 Pint of rheumatic drops

> "This stock will be sufficient for a family for one year, and with such articles as they can easily procure themselves when wanted, will enable them to cure any disease, which a family of common size may be afflicted with during that time. The expense will be small, and much better than to employ a doctor and have his extravagant bill to pay."

Even in the dull 1790's all the cultists hid under one cloak, and dragged with them all those irregular practitioners possible to increase their support, as evidenced by the following concerning obstetrics:

> "Many men . . . have attended . . . their own wives, and I have never known of an instance of any bad consequences; and if young married men would adopt the same course, it would be much more proper and safe than to trust their wives in the hands of young inexperienced doctors . . their cruel and harsh treatment in many instances would induce the husband to throw them out of the window."

One hundred and fifty years of medical progress have passed since publication of this popular volume, in its fourth edition in 1827 and reissued in 1849, six years after the author's death; and yet despite this progress not only in science, but in civilization, over 110,000 California voters in 1934 signed the Naturopathic initiative petition, contributing to so much additional turmoil in the election campaign of that year. What a pity Samuel Thomson cannot be alive to join forces with some of his modern day successors! His thirty years' experience are not needed here—we have *advanced:* if some of the proposed initiatives become laws, only a general school education of less than full high school standards would be necessary, plus a few enlightening weeks in a cultist school, to enable the botanists of 1934 to practice medicine and surgery in California!

Shades of Hippocrates!

CLINICAL NOTES AND CASE REPORTS

SCLEROSING LESIONS OF THE STOMACH, TERMINAL ILEUM AND COLON

REPORT OF CASE RESULTING FROM CHRONIC MERCURIAL POISONING

By Albert E. McEvers, M.D.
Los Angeles

A FAIRLY extensive search of the literature does not reveal any record up to date of chronic mercurial poisoning that caused gastrointestinal sclerostenosis, with intestinal obstruction.

REPORT OF CASE

Mrs. E. B., age 68, admitted to hospital March 4, 1931. Family history irrelevant.

Past History.—The patient was desperately ill when she entered the hospital and it was difficult to get her medical history. She had been fairly well until three years previous to the present illness, when she had an alleged nervous breakdown, confining her to bed for some time. From then on, constipation gradually increased, which required large doses of cathartics and enemas for elimination. She had many attacks of vomiting, with indefinite generalized abdominal pain and abdominal distention, which became more persistent and frequent.

The patient lived alone, and the only additional information obtained from relatives was that she had taken patent blood medicine for many years. Whether this blood medicine contained mercury could not be definitely established.

Course of Terminal Illness.—Three days prior to her admission to the hospital the patient had an attack similar to previous ones, but was unable to relieve herself. She had persistent fecal vomiting, generalized abdominal pain, and distention.

Examination. — A poorly nourished, white female, desperately ill, perspiring profusely, dehydrated and toxic, with a distended abdomen; temperature, 101 F., pulse 120, respiration 28. There was no visible peristalsis, no tinkling. She represented an end-stage of obstruction. There were no scars from former operations, no hernia; rectal examination revealed little, if any, information.

Hemoglobin (Dare) 85 per cent; leukocyte count, 33,900; erythrocyte count, 4,750,000. Urine was cloudy, specific gravity 1015, acid reaction, trace of albumin, no sugar or acetone. Microscopic examination showed a few granular casts, a few leukocytes, no erythrocytes.

Treatment.—Intravenous infusions and hypodermoclysis were given to replace fluid and chemical loss. The patient was too ill to undergo extensive surgery. Under local anesthesia, an enterostomy, without exploration, was done. There was considerable drainage from the enterostomy tube; however, no improvement was noted, and the patient expired in twenty-four hours.

Postmortem. — The interesting findings at autopsy were sclerosing lesions of the stomach, terminal ileum, lower end of descending colon and sigmoid.

The stomach was leather-bottle type. For three feet proximal to the ileocecal valve, the terminal ileum was small, about one-half inch in diameter, cord-like, and indurated. At the proximal end of this sclerosed portion of the ileum, there was complete obstruction; above the obstruction the bowel was thin, walls were stretched and ballooned out. The lumen at the distal end of the sclerosed lesion would admit the tip of a small probe. The lower part of the descending colon and sigmoid presented a similar appearance, being a little larger than the terminal ileum, as was its lumen. The rectum appeared more or less normal.

The gross appearance of these lesions suggested Krompecher's carcinoma disseminatum or "linitis plastica." Specimens of the tissue were examined by Dr. George H. Hansmann, who reported as follows:

"The specimen identified as G-31-79 is composed of sections from the stomach (pyloric end), terminal ileum and descending colon.

"Two sections of stomach are present, both taken in the region of the pylorus. One section shows an absence of mucosa with the base of the ulceration made up of chronic granulation tissue. This ulcer gradually merges into another, whose underlying structures are composed of normal stomach wall which is infiltrated with polymorphonuclears. This denuded area is covered by fibrin and polymorphonuclears. There is no evidence of neoplasm. Several large vessels in the old ulcer area show marked subintimal proliferation with a resultant very small vessel lumen.

"Section of the ileum, taken from the upper and middle segments of the terminal three feet submitted, show nothing remarkable. A section, however, taken near the ileocecal valve shows necrotic débris in the lumen, which is heavily infiltrated with polymorphonuclears. Organisms are present in this débris. The wall has a few polymorphonuclears in it.

"The section of the descending colon shows a markedly contracted colon, so that only a very small lumen remains. The mucosa is almost completely absent, being replaced by necrotic tissue and fibrin. The submucosa is quite edematous, but also shows some increased amount of connective tissue. The most striking picture, however, is the injury to the vessels in the submucosa. The arteries appear to be more involved than the veins. They show fibrinous thrombi in their lumina in variable amounts, from complete occlusion to only a small deposit on the intima. The whole wall is heavily infiltrated with polymorphonuclears.

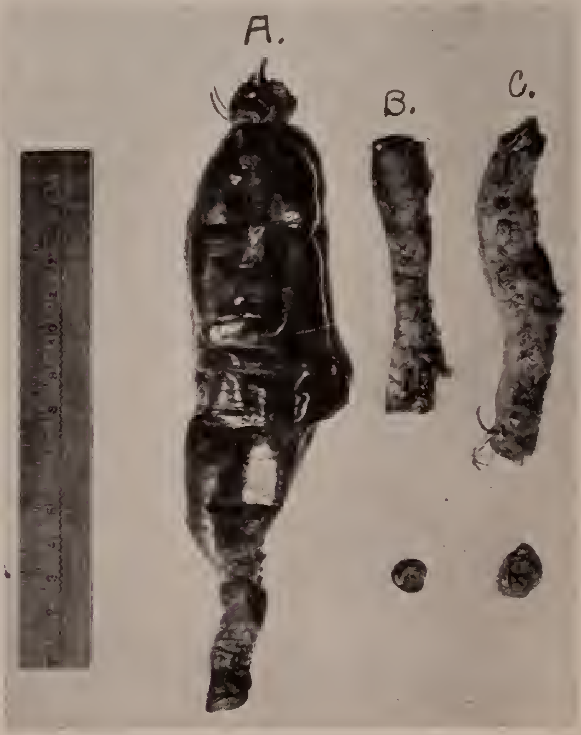

Fig. 1.—Terminal ileum and sigmoid: (*a*) showing the point where obstruction became complete in the terminal ileum, the ballooned and thinned-out segment of the ileum above the obstruction, and the cord-like, sclerosed and thickened bowel below; (*b*) terminal ileum with cross section showing almost complete loss of lumen; (*c*) section of the sigmoid with cross section showing the lumen, which is larger than that of the terminal ileum, but fairly well obliterated.

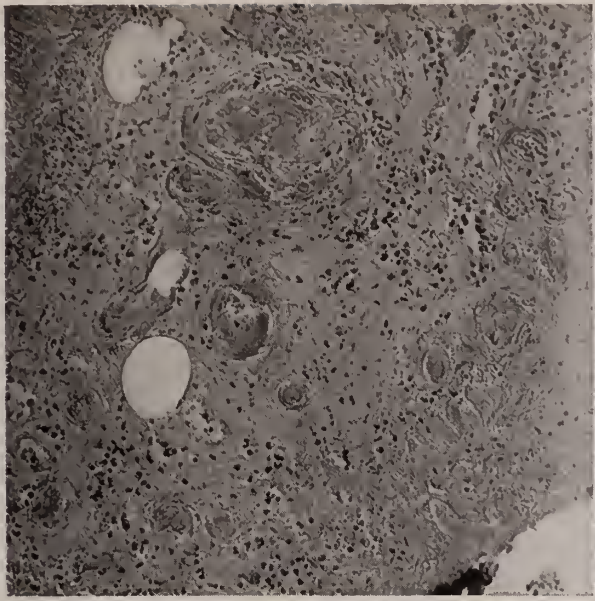

Fig. 2.—Mercurial poisoning: tissue from lesion of stomach in this case; note number of occluded vessels, ulceration and inflammation.

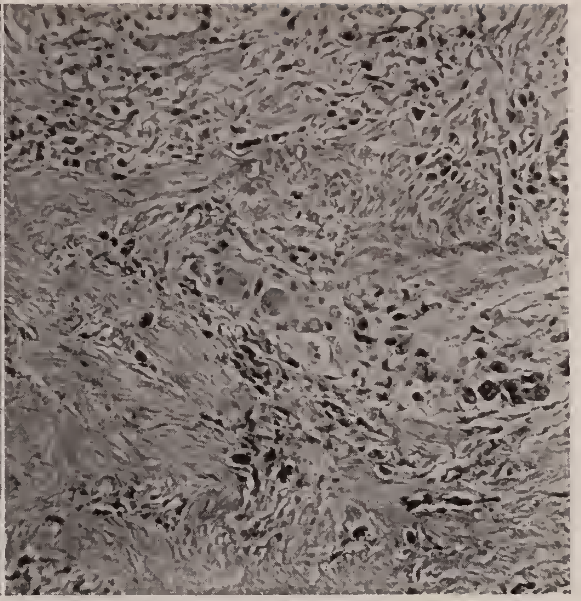

Fig. 3.—Linitis plastica: Krompecher's carcinoma disseminatum; note small epithelial infiltration and scar.

"In the above description it is quite evident that there is no evidence of neoplasm. It also appears that the lesion is one of a vascular nature. The extensive necrosis in the lower ileum and colon appears to be secondary to the vascular occlusions which are easily demonstrable. The etiologic agent producing this vascular injury remains obscure. The sections were examined by Dr. S. B. Wollbach of the Harvard Medical School, and his conclusions are no more definite than ours.

"There is yet, however, one thing which may be done in an effort to find an etiologic agent. This is the examination of the tissue for the presence of mercury."

Tissue from these specimens was forwarded to the Pharmacological Laboratory of Western Reserve University, and a chemical analysis of sections of the organs for the detection or presence of mercury gave the following results:

Organ	Weight	Mercury
Colon (cecum)	42 gm.	9.9 mg. hg.
Stomach	45 gm.	0.2 mg. hg.
Ileum	230 gm.	2.0 mg. hg.

COMMENT

In view of the report of the chemical analysis made from sections of the colon, stomach, and ileum, it would seem that there is established a definite relationship between these lesions and the mercury revealed.

The method of analysis used does not indicate in which form the mercury existed, and the mercury present was recovered as metallic mercury. Normally, if no mercury has been administered or ingested the tissues do not contain detectable amounts.

It has been found that after mercury medication a portion of the injected mercury is retained indefinitely in the body; 50 to 60 milligrams with therapeutic courses of intramuscular or intravenous injections of soluble inorganic or organic compounds, and from 200 to 700 milligrams of mercury are retained in the body following intravenous injections of colloidal solutions.

Mercury is eliminated by the bowels, kidneys, liver, and saliva. The main outlet of mercurial compounds is through the kidneys. The mercury compounds of small solubility pass out of the system mainly through the intestine in the form of mercuric sulphid.

Myers and Throne[1] call attention to the possibility of heavy metals entering one's system through water, food supplies and occupational sources. Lead drinking pipes are frequently a source of contaminated water according to them, and insecticides sprayed on raw fruits and vegetables are another.

It would be interesting to have a chemical analysis made for the presence of mercury on similar tissue in patients where there is a history of having taken mercury in various forms therapeutically; also on tissue from patients who have a clear history of no mercury ingestion.

DIAGNOSIS

Krompecher calls attention to a group of benign cases of linitis plastica, which he termed "gastro-intestinal sclerostenosis." Leith, as quoted by Ewing, described a case of this type as noncancerous cirrhosis. The lesion involved stomach, ileum, and colon, but the microscopical report is somewhat lacking in details, although the author positively excludes carcinoma.

It is apparent from the literature that there are cases of linitis plastica that are not malignant. Boyd describes fibromatosis of the colon affecting any part of the large intestine, but more frequently in the pelvic colon, and the rectum. The bowel wall is thickened, due to the formation of dense inflammatory tissue in the submucous coat. The mucosa is nodular or polypoid, as in tuberculosis, and may be ulcerated.

Boyd further states that the exact cause of this condition is not known, but evidently is chronic inflammatory in nature. The infection probably gains access to the submucosa through the mucous membrane by some abrasion or other local lesion.

G. Faroy[2] reports three cases of plastic linitis, and he discusses the rôle of syphilis in the pathogenesis of this disease. He indicates that syphilis frequently is the cause of cirrhosis, and that it even plays a rôle in cirrhosis due to alcoholism or other intoxications; and that syphilis alone is able to injure the arterial coats separately and en bloc, as well as sclerosis in almost every other organ.

There is a difference in the gross specimen in this case and that of the so-called linitis plastica. The trained pathologist brings out these differences by touch, which indicates to him differences in elasticity and friability of the tissue. The photomicrographs (Figs. 2 and 3) are shown for direct comparison. It is immediately apparent that the gross appearance is vastly different between the photomicrograph of this case and the one of linitis plastica type of carcinoma of stomach.

SUMMARY

The demonstration of metallic mercury recovered in appreciable amounts from the tissue taken from the lesions in the stomach, terminal ileum, and colon, establishes a relationship with the gastro-intestinal sclerostenosis. I believe that mercury was the etiologic agent responsible for the vascular lesions found histologically.

A SIMPLE SPLINT FOR FORCED EXTENSION OF THE ELBOW*

By Gordon M. Morrison, M.D.
San Mateo

THE improved plaster now available makes possible the fabrication of many useful orthopedic devices, using the molded plaster instead of metal parts. The splint described is a modification of the diamond splint, and is useful for producing extension of joints fixed in flexion, as in stiffness of the elbow, following the healing of a fracture in flexion. This device was designed for such a case after prolonged attempts with physiotherapy gave poor results. Twenty-four hours after application, this stiff elbow joint, which was refractory to other types of treatment, was in complete extension. Construction of the appliance is self-explanatory from the illustrations.

TECHNIQUE

A circular plaster is applied over stockinette in two segments, one above and one below the affected joint. A one and one-half inch barn-door hinge is placed at the flexion angle and fixed in place with additional plaster. Two small, right-angle brackets are then incorporated near the distal ends of the plaster. The joint is next put through any possible movement to correctly align the hinge and brackets before the plaster is completely set. When the plaster is sufficiently dry, it is bivalved; the drilled tongue depressors are bolted into place, and a few elastic bands are placed, as shown in the diagram, and the apparatus is reapplied to the affected extremity, with bandage or adhesive.

BILATERAL SALIVARY CALCULI

By H. P. Merrill, M.D.
Los Angeles

WHILE calculi in the salivary glands and ducts are fairly common, and there is no reason why they should not occur bilaterally, I can find no reference in the literature to such an occurrence. Two or more stones in the same gland or duct are mentioned, but one in each submaxillary duct is rather unique.

REPORT OF CASE

Case 1.—This patient, a man of thirty-seven, had gone through several attacks of pain and swelling along the left side of the jaw and under the tongue. These had been diagnosed as quinsy, and had subsided without much trouble or treatment. This time the pain and swelling were worse, and there had been some fever for three days.

The local physical signs were typical of a blocked submaxillary duct, with cellulitis of the floor of the mouth. There was some swelling externally. An incision along the floor released considerable pus and saliva. A hard mass was felt in the cavity at this time. The symptoms subsided rapidly, and three days later the calculus presented in the wound and was removed.

Before this wound had healed, the patient returned with pain and some swelling on the right side. A probe passed into the submaxillary duct touched a hard mass in about the same position as the one on the left. This calculus was also removed intraorally under local anesthesia.

Both calculi were oval and about 1.5 centimeters long by 0.75 centimeter in diameter. They were very hard, as compared with most salivary calculi.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

DYSMENORRHEA

ETIOLOGY AND PATHOLOGY

Lyle G. McNeile, M. D. (523 West Sixth Street, Los Angeles).—Unfortunately, the exact etiology of dysmenorrhea is still unsettled. Pathologic changes are not at all constant, and it is certain that no characteristic changes exist which would apply to all cases of dysmenorrhea.

As Curtis states, "Like eclampsia, dysmenorrhea is a disease of theories, and no single conception fits all cases. Many ideas, once implicitly accepted, have had to be discarded in the light of further knowledge." Most authors divide dysmenorrhea into two types, primary and secondary. The secondary type is caused by pathologic conditions in the pelvis, usually uterine fibroids, endometriosis, salpingitis, ovarian cysts, or chronic inflammatory disease. Since the etiology of the secondary type is known, surgical correction of the pathologic disturbance usually cures the menstrual pains.

Primary dysmenorrhea, on the other hand, is not associated with any abnormality in the pelvis, and there is no unity of opinion concerning the exact cause of this type of pain. The most current theory has been advanced by Novak and Reynolds, who are of the opinion that the immediate cause of dysmenorrhea is an exaggerated contractility of the uterus, manifested by pain, if the pain threshold is lowered, or if there is an actual unbalance between the two hormones that appear to regulate this. These two hormones are the follicular factor, the normal stimulant of uterine excitability, and progestin, the normal inhibitor. Other investigators believe that the pains associated with menstruation are due to an unbalance in the pelvic sympathetic system. It seems to the author probable that both factors are involved.

In his opinion, the rôle of malpositions of the uterus in producing dysmenorrhea has been greatly exaggerated. While it is true that both anteflexion and retroversion of the uterus are frequently associated with dysmenorrhea, the physician who assumes that the correction of these conditions will likely cure the dysmenorrhea is usually doomed to disappointment.

* * *

SYMPTOMS AND PROGNOSIS

Albert V. Pettit, M. D. (2000 Van Ness Avenue, San Francisco). — I find difficulty in profitably discussing this part of the symposium assigned to me without making occasional excursions into the field of etiology and therapeutics.

Let us first consider the symptoms of primary or essential dysmenorrhea, that is, that group not dependent on gross pelvic pathology even though it may at times be associated with it.

The symptoms of primary dysmenorrhea do not begin with the menarche, as is generally believed, but from one to ten years after the regular establishment of the menstrual flow. The symptoms begin as mild discomforts, gradually increasing in intensity until the menses are often completely incapacitating.

A typical attack begins shortly before the appearance of the flow, often as much as two days before. Usually the first symptom is pain, either cramp-like or steady, felt in the region of the uterus. This is often preceded by sacral backache and practically always accompanied by it. Headache occasionally with nausea and vomiting, sweating with cold skin and pallor quickly follow. These symptoms tend to increase until the flow is well established, when they suddenly subside. The suddenness with which the symptoms sometimes occur and later disappear is suggestive of allergic phenomena, but the sympatheticatonia may be entirely due to uterine pain, and the striking cure of these symptoms by presacral sympathectomy is very suggestive of this.

In certain cases all of the above symptoms are present, in others only a few; but it is surprising how often a careful history will reveal an alternation in the severity of the symptoms, a painful menstruation alternating with a relatively comfortable one. The one symptom most bitterly complained about is the backache from which the patient feels there is no escape.

In dysmenorrhea of the secondary type, that is, those in which gross pelvic pathology is responsible for pain, in the group made up of those having congenital stenoses or atresias, the lower abdominal pain begins with the menarche, and becomes very violent after two or three periods; so that menstruation in patients with complete obstructions show violent uterine pain with nausea, vomiting, shock, tender and often rigid abdomens, occasionally fever and later a palpable mass. In these cases there is pain with each menstruation, and all symptoms become progressively worse.

Secondary dysmenorrhea, due to endometriosis or adenomyoma, may appear at any time after the menarche, but usually after several years, often late in life. The symptoms cannot be distinguished from that of primary dysmenorrhea, showing essentially the same vagaries, but may begin several days before the onset of the flow; may be accompanied by a discharge of blood from the rectum, and may show marked evidence of peritoneal irritability. Palpable pelvic masses, without cervical infection with the above symptoms, make the diagnosis relatively simple.

Pain, which simply accompanies menstruation due to inflammation or with fibrosis and adhesions following inflammations, is generally adnexal in location and should be called menorrhalgia. In this group there is no characteristic time of appearance of the symptoms. In my experience, inflammations play an insignificant rôle in the production of menstrual pain.

It is impossible to give a prognosis which will cover all classes of dysmenorrhea.

Generally speaking, uncomplicated primary dysmenorrhea tends to disappear after the age of thirty, usually disappears after a pregnancy, and many persons are free from pain after regular intercourse is resumed. Unfortunately, many of these patients are very infertile. The cure in those who become pregnant is not necessarily due to the pregnancy itself, but to a correction of the endocrine imbalance, which also caused the sterility. Results of treatment in primary dysmenorrhea have improved markedly during the past few years, and one has only to mention the use of atropin, thyroid extract, emmenin, irradiation of the hypophysis, alcohol injection of the posterior uterine sympathetic nerve supply, and presacral sympathectomy, to indicate what may be done with good prospects of improvement and cure of the painful sensations arising in the uterus. Psycogenic components in varying degrees are present in practically all cases of dysmenorrhea due to the inevitability of recurrence. These components disappear rapidly after any real relief.

Treatment of congenital or acquired anomalies in the pathway for escape of menstrual discharges is surgical. Treatment of adenomyomata and endometriomata is effective by surgery, which is destructive, or by irradiation, which may or may not be destructive. In any event, the treatment of the pain has an excellent prognosis, but the child-bearing function is lost.

Treatment of menorrhalgias due to inflammatory disease is mainly hyperthermia, with or without surgery, which can be conservative. The prognosis is good in such cases.

An interesting suggestion as to the etiology of menstrual backache has been recently made by Dr. E. Chamberlain of Temple University, who thinks that it is probably due to a cyclic recurring sacro-iliac subluxation somewhat similar to the change in the pelvic articulations seen in pregnancy. Treatment of this menstrual backache as an orthopedic problem just as most, if not all other backaches in the female should be treated, may allow us to give a good prognosis in regard to this part of dysmenorrheal symptomatology also.

* * *

DIAGNOSIS AND TREATMENT

L. A. Emge, M.D. (Stanford University School of Medicine, San Francisco). — Dysmenorrhea (menorrhalgia), like headache, is only a symptom and not a pathologic entity nor a disease in the true sense of the word. Strictly speaking, the patient makes the diagnosis of dysmenorrhea, but the physician searches for the cause. This is a complex problem and demands painstaking attention to a number of details, without which treatment is haphazard and disappointing. It is self-evident that a good history is essential. Physical examination must be complete. Laboratory studies should include at least a complete blood count and, if possible, a B. M. R. determination. In my own work, I make it a point to obtain data which enable me to answer the following important questions:

1. When did pain occur first in relation to the menarche?
2. When does pain occur in relation to the individual menstrual cycle?
3. What is the type, location, and duration of pain, and what are the endocrine stigmata of the body; and are there reflex disturbances?
4. What is the type of uterus (shape, size, position)?
5. How does the physical make-up of the patient compare with diet, exercise, work, and body hygiene?
6. What is the relation of the functional or emotional constitution of the patient to the severity of the pain complained of (evaluation of pain)?
7. Does pelvic pathology exist; and if so, is it incidental to, or has it a bearing upon dysmenorrhea?

With these questions satisfactorily answered, one can readily determine whether dysmenorrhea is congenital or acquired. This is of importance because the former is frequently of endocrine origin, while the latter is more often of organic origin. So-called psychogenic types of dysmenorrhea may fit into either category and are the most difficult to diagnose.

Most of the functional or endocrine types of dysmenorrhea occur simultaneously with the onset of menstruation and usually last not more than twenty-four hours. Comparatively few women experience pain over longer periods. Such pain is usually severely spastic in type, and often accompanied by nausea and vomiting, with general prostration. This combination of pain and reflex disturbances is less often encountered in secondary or acquired dysmenorrheas. In the latter type, pain more frequently appears before menstruation, beginning as early as seven to ten days prior to the beginning of the flow. This may be indicative of pelvic inflammatory disease involving the ovaries, endometritis, endometriosis, adenomyosis, large submucous polyps, or pedunculated fibroids. Ovarian cysts rarely are accompanied by dysmenorrhea, and then only when secondary inflammatory changes are present in the pelvis. Likewise, uterine displacements, as such, rarely give rise to dysmenorrhea. Many developmental and positional anomalies are only part of a general developmental disturbance due to endocrine deficiencies, the latter being the real factor in pain production. This is most often the cause of primary or functional dysmenorrhea. One cannot stress this point too forcefully, for it is a patient of this type who so frequently is subjected to uterine suspension without relief from pain. At times dysmenorrhea accompanies acquired uterine displacements, and in my opinion is due to the formation of pelvic varicosities. Patients suspected of such a condition should be examined in a standing position. Only then can the enlarged veins be readily palpated. The insertion of a well-fitting pessary after replacement of the fundus is the best means to evaluate the importance of uterine displacements, so far as pain production is concerned. The type of pain which accompanies retroversion is very distinct for the two general types of dysmenorrhea. In the functional or endocrine group, pain is usually of the typically spastic type accompanied by reflex disturbances, while in the acquired group it is usually a disseminated pain radiating laterally along the posterior aspects of the thighs.

Next in importance in the diagnosis of dysmenorrheas is the evaluation of pain. This is a difficult task, requiring a keen appreciation and thorough understanding of the psychic make-up of women. Degrees of pain are undoubtedly differently interpreted by different individuals. This holds good for both patient and physician. Unless one delves into the functional behavior of the individual, one cannot be sure how much of the pain complained of is real, and how much of it is an expression of a defensive mechanism or some other form of a disturbed psychologic balance or emotional instability. I do not share the belief that all types of functional dysmenorrhea are purely psychogenic in origin, but I am convinced that numerous individuals magnify pain because of emotional instability. Later, when discussing treatment with such patients, this point must be stressed with tact and in a sympathetic vein, so that the patient may appreciate that her own efforts to forget her infirmity are a step toward a more speedy relief.

In the physical examination a careful observation of body stigmata will often give the clue to an endocrine disturbance. Blood and metabolism studies are indispensable for a careful diagnosis. Minor degrees of hypothyroidism are very common, and often the sole cause for dysmenorrhea. It is well known that anemic and chlorotic girls frequently suffer from dysmenorrhea. If properly diagnosed, these conditions are easily corrected. In the pelvic examination the size, shape, and position of the uterus should be carefully noted. The hypoplastic uterus frequently indicates hypopituitary disturbances. The infantile uterus is most often indicative of hypo-ovarianism, and the tall, bulky uterus which has not lost its infantile proportions is most frequently associated with hypothyroidism. Pelvic search for tumors, and fixations due to pelvic inflammatory disturbances, and endometriosis are next in importance. I should like to call attention to the fact that dysmenorrhea accompanying the latter condition invariably appears years after the onset of menstruation, and is characterized by the progressive severity of pain and by the appearance of pain late in the menstrual period, lasting for some days after the cessation of the flow. These patients also frequently complain of premenstrual soreness well distributed throughout the pelvis.

To recapitulate, the diagnosis of dysmenorrhea concerns itself with determining (1) the type of dysmenorrhea; (2) its relation to the menstrual cycle; (3) the evaluation of pain; (4) its localization; (5) the evaluation of the organic make-up; and (6) the evaluation of pelvic findings.

Unless one can make a careful diagnosis, the treatment of dysmenorrhea is about as unscientific as that of headache. I do not wish to imply that it is always possible to devise the proper type of treatment for every patient even after a very careful analysis of the complaint, but one can come close to such a goal.

Since there is a large group of young women who, under the stress of school, college, or business life, neglect their body hygiene, one should delve into their mode of living as well as their mental fitness, and give proper advice as to exercise and rest and mental hygiene. Sex questions must be cautiously and tactfully approached. In these days of diet fads many young women suffer from food deficiencies. Anemias should be corrected and a proper dietary regimen should be ordered regardless of the wishes of the patient to remain slim and boy-like. It has been advocated recently that a high carbohydrate diet, because of its influence on blood sugar, relieves dysmenorrhea, for it has been found that in certain individuals hypoglycemia and dysmenorrhea go together. As a rule, there is no reason why the average young woman should curtail her activities during menstruation, for there is no proof that moderate athletics have a detrimental influence on menstruation. Moderately hot baths or showers create no disturbances when used during the menstrual flow. In fact, in many instances minor types of dysmenorrhea are completely relieved if patients are permitted to continue their ordinary activities and make use of hot baths freely during the menstrual period. I have not hesitated to let young women take hot douches during menstruation in order to relieve pain, and I have never found that this procedure has created pelvic disturbances. To the contrary, heat applied in this manner, or in the form of a "sitz" bath, is good medicine, and is quite preferable to more radical procedures. In this connection, it may be of interest that in both primary and secondary types of dysmenorrhea the utilization of detergent suppositories is of a distinct benefit to the patient. For many years I have used such a suppository commercialized by Wyeth and marketed as No. 426, which, aside from the detergent agents, contains an anodyne. I order the patients to precede the use of these suppositories with a copious plain hot water douche, to be taken night and morning, beginning three days before menstruation and carried into the second day of the flow. This procedure has given immediate and often permanent relief after a few months of self-treatment. The patient soon learns how often and how long to use these agents. It saves her office visits and medical care, and often relieves her sufficiently from pain to continue her daily duties during menstruation with reasonable comfort. It is my experience that in obscure types of functional dysmenorrhea where endocrine therapy has failed, this simple procedure will give satisfactory relief.

Where dysmenorrhea is frankly due to an endocrine dyscrasia the choice of treatment may be very simple or very complicated. The simplest problem offers itself in thyroid deficiencies. It is rather interesting to know in this connection that in hypothyroidism dysmenorrhea is about as often relieved by the administration of thyroid as by iodin therapy. Individuals who present the picture of pituitary deficiency are frequently relieved by the administration of anterior pituitary-like hormones, of which there is a wide range of choice—antuitrin—S, follutein, Collip's A. P. L., and similar substances. The dosage is arbitrary, and is to be determined by the amount of relief experienced. Usually one to two cubic centimeters given hypodermically every other day for six doses preceding menstruation, will produce the desired result. The disadvantage of this treatment is the necessity of the patient's visits to the doctor's office. Therefore, whenever possible, one should try ether-washed emmenin, a placental hormone of the anterior pituitary-like type. This is taken by mouth in dosages varying from one to three teaspoonfuls daily. In my own experience it is about as efficacious as hypodermic medication, but not always well tolerated because of the harsh taste. It is best to start with a fairly liberal dose, reducing the amount after relief from pain has been experienced. It is not at all unusual to obtain permanent relief after two or three months of such a regimen.

Individuals of the hypo-ovarian type are often relieved by the administration of estrogenic substances such as theelin, amniotin, folliculin, folliculin menformon, progynon, and hypodermic agomensin, and other similar substances. Here, too, the dosage is arbitrary. The trend is toward larger doses up to 1,000 international units, given hypodermically every other day until relief from pain has been obtained. After this the interval is increased, and ultimately the dosage is reduced. Many of these substances are put up in oil and are not always well tolerated by every patient. The advantage claimed for the oil preparations is that they are absorbed more slowly, which permits longer intervals between injections. I am not certain that this is correct. The administration of the water-soluble types, such as folliculin menformon, is painless, but is said to require a longer continuation of administration at shorter intervals. I also doubt this statement. One must take into consideration the reaction of the patient in choosing the proper agent and the proper dosage.

The disturbing factor in treating dysmenorrhea related to endocrine disturbances is that, scientifically speaking, it is not always rational. One can understand that the anterior pituitary-like hormones such as emmenin, antuitrin-S, follutin, A. P. L., etc., will relieve a spastic uterus, because they also produce an increase in uterine and para-uterine vascularity. It is not so easy to rationalize the use of thyroid and iodin, and it certainly is not easy to explain the action of estrogenic substances, for they are supposed to produce a contraction of the uterus. Nevertheless, clinical experience and results justify the use of these substances, and at times demand an interchange or even a combination of substances. After all, it is the relief of the patient that counts, even if our efforts cannot be explained on a purely scientific basis; and in its final analysis it matters not whether the action of the substance is specific, pharmacodynamic, or psychotherapeutic. All of these factors are cleared up by time and usage. At this particular time our knowledge of the endocrine behaviors and their relation to our functional lives and our sympathetic nervous systems is still very obscure. Laboratory experimentation alone is not going to give us an answer as to how these substances work in the human being. We have to go on trying, and thus add to our store of knowledge by trial and error. The boost that has been given the poor sufferer from dysmenorrhea by the endocrine substances is the greatest advancement made in therapeutics in the field of gynecology.

The question of treatment of acquired dysmenorrhea due to inflammatory or neoplastic disturbances can be answered with few words. In the first place, comparatively few inflammatory disturbances are accompanied by dysmenorrhea, once they reach the chronic stage. An exception to this is endometriosis, and that rare disease endometritis! If the ordinary local treatments such as I have outlined bring no success, the various forms of intensified heat treatment are worth trying. Diathermy has not been successful in our hands. We have had no experience with the Elliott machine, but we have had extensive experience with hyperthermia given in the form of high-heat prolonged baths. The use of this method is rather new, and we can only give our impressions. I prefer to simply state that there is a field for this method. From other sources I have learned that hyperthermia induced by short-wave electric currents promises similar results. If any of these conservative forms of treatment fail to produce results, surgical methods are in order. The same holds true of dysmenorrhea due to benign neoplastic disturbances. Here surgery is usually preferable to irradiation, since the ovaries can be preserved.

I have left the discussion of surgical and mechanical therapy of functional dysmenorrhea to the last. At times when all other therapeutic measures have failed, we are forced to resort to mechanical treatment. It should be resorted to only after all simple methods have been exhausted. So-called intractable dysmenorrhea is very rare. Just what constitutes intractability depends in a large measure upon the state of mind of both patient and doctor. And may it be said without malice that the more patient the doctor the less the incidence of intractability—and clever hands are often the reason for a surgical approach to the problem, when a patient mind would have found an easier and often better way out.

The simplest form of mechanical treatment is the use of negative galvanism applied directly to the cervical canal. It can be used either in the form of a smooth or interrupted current, and must be given over a period of several months. The use of negative galvanism, which produces cervical dilation and increases the uterine blood supply, is in most instances preferable, and more permanent than forceful cervical dilation under an anesthetic. It is decidedly preferable to the stem pessary. It must not be used in the presence of cervicitis.

A very efficacious method of controlling dysmenorrhea, which has failed to respond to other measures, is the alcohol block of the paracervical ganglia, originally advocated by Blos. This method demands a keen sense of touch, and vivid visual memory of the relations of the structures in the immediate vicinity of the cervix. By passing a 20-gauge 3-inch needle through the posterior lip of the cervix into the paracervical tissue in the vicinity of the angle formed by the uterosacral and broad ligaments, five cubic centimeters of 5 per cent novocain in 70 per cent alcohol are injected slowly into the areolar tissue which contains Frankenhäuser's ganglia. One injection is usually sufficient, and gives relief to about 80 per cent of patients. A repeated injection relieves another 10 per cent. For those who are not relieved, we advise resection of the presacral nerve. Surgery of the displaced uterus is rarely necessary, and will give relief only if pain is due to unusual venous dilatation, varicosities and varicoceles of the pelvic circulation. No uterus should be suspended for dysmenorrhea without first having convinced one's self that replacement of the organ by a well-fitting pessary relieves the pain. Should the operation be indicated, the basal ligaments should be shortened and unusually large varicosities ligated.

When dysmenorrhea is known to be of inflammatory, neoplastic, or endometrial origin, destructive surgery is unavoidable.

Radiologic treatment of either the pituitary or ovarian regions is of very doubtful value and demands a critical interpretation. Doctors Newell and Pettit of this institution have recorded their studies, and they will appear in this JOURNAL in due season.

There then remains nothing further to say except that many women who suffer at the time of their menstrual periods are relieved spontaneously after they enter their "twenties." Childbirth and orderly sex life bring relief to untold thousands of others, while some go on suffering for the entire span of their menstrual life, learning to bear their burden just because they are women.

Psychic Behavior at High Altitudes.—Jongbloed investigated whether the oxygen deficiency would impair the alertness of an aviator flying at an altitude of 5,000 meters, pointing out that such heights occasionally are necessary when high mountains have to be crossed, particularly if cloudiness obscures the mountains. The alertness of the aviator is especially important in case of so-called blind flying that may be necessary on account of the cloudiness. The author found that the rarefaction of the atmosphere at the altitude of 5,000 meters causes only slight impairment of the mental alertness in the radio telegrapher. He found that the slowing down of the mental alertness was most noticeable in the choice reactions, the regularity being influenced more strongly than the duration of the reaction time. However, the author is convinced that a trained aviator can safely fly for about an hour at an altitude of 5,000 meters, but that a further increase in the altitude decreases the alertness rapidly and, for instance, blind flying during bad weather makes higher demands on the alertness of the aviator. Three of the author's test subjects had to breathe oxygen shortly after an altitude of 5,000 meters had been reached, while four others had difficulties. This indicates that at this altitude difficulties may be encountered in passengers, for, although the aviators can be selected in air transportation, the passengers cannot. Accordingly it is necessary to take measures so that air transportation will not cause difficulties even in the weakest of the passengers. The author states that an oxygen supply should be available for altitudes of more than 5,000 meters. However, he thinks that breathing-masks and other instruments are likely to alarm the passengers and should be avoided. He thinks that since the cabin of a modern plane has a regulable ventilation system, it would probably be possible to keep the oxygen tension high enough by forcing in a supply of oxygen.—*Klinische Wochenschrift.*

Age Incidence of Causes of Illness.—Collins presents the results of periodic canvasses of 8,758 white families living in 130 localities in eighteen states and including 39,185 individuals. Each family was visited at intervals of from two to four months for a period long enough to obtain a sickness record for one year. On the first call a record was made of the number of members of the household, together with data about sex, age, marital status, and communicable disease history of each person. On succeeding visits the canvasser recorded all illness that had occurred since the preceding call, with such pertinent facts about each case as the date of onset, the duration of disability and of confinement to bed, the nature of such medical service as was obtained, and the termination of the illness. The surveyed families include representation from nearly all geographic sections, from rural, urban and metropolitan areas and from all income classes, and consist of both native-born and foreign-born persons. The proportions of these various elements included are not identical with those in the population of the United States, but the variations are not generally large. In other respects also the surveyed group is not dissimilar to families in the general white population of the United States. The age incidence of all the specific diseases that were reported in sufficient numbers to approximate a reasonably accurate age curve are depicted in graphs and tables. While there are irregular chance variations in many of the curves, they serve to indicate the general picture of the age incidence of even the less frequent diagnoses.—*Public Health Reports.*

If one continues to ply one's mind, growth ensues, even in the years formerly supposed to be marked by stagnation and decay. To foster this growth one must not trust too much to the casual gains of everyday work and experience. One must put forth well-directed efforts. Merely to maintain one's status is not enough. He who is satisfied to stand still will soon slip backward. To grow one must go on learning. So it has come about that education, formerly thought to be an activity limited to the days of one's youth, is now seen in one form or another to be desirable in all periods of life. Thus one continues to improve; thus one keeps young.—Leon J. Richardson.

"Poor posture" is a sign that the child needs a careful and complete medical examination to discover the underlying cause of poor posture. The "poor posture," like toothache, is really nature's warning that something is wrong and the child needs the physician's help to discover what that "something" is and to tell him how to correct it. When the cause is removed or corrected, the poor posture usually disappears. Treat the child, not the posture.

Some of the grotesque attitudes in which children sit or lie have a real purpose back of them, for they relax the child's tired muscles and let him "rest up" most quickly.—LeRoy A. Wilkes, M. D.

The ladder of life is full of splinters, but they always prick the hardest when we are sliding down.—W. L. Brownell.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the iront advertising section (Adv. pages 2, 4 and 6).

CALIFORNIA MEDICAL ASSOCIATION

ROBERT A. PEERS..........President
EDWARD M. PALLETTE..........President-Elect
FREDERICK C. WARNSHUIS..........
Secretary-Treasurer and Associate Editor for California

STATE AND COUNTY SOCIETY ACTIVITIES

WHAT DID YOU SAY?

If you are tempted to reveal
A tale someone to you has told
About another, make it pass,
Before you speak, three gates of gold,
Three narrow gates—first, "Is it true?"
Then, "Is it needful?" In your mind
Give truthful answer; and the next
Is last and narrower: "Is it kind?"
And if to reach your lips at last
It passes through these gateways three,
Then you may tell the tale, nor fear
What the result of speech may be.

—From *The Arabian*, quoted in *The Rainbow*.

It is highly desired that members strive to conform to the above quoted advice. That there is a need for hesitancy and reflection in "What did you say" and how you said things, is evidenced by the increasing number of malpractice suits. In one county a 300 per cent increase in suits filed is recorded for the past year. Insurance companies are increasing rates and some are withdrawing coverage in certain counties and areas.

Primarily, many suits can be characterized as being wholly without merit, but masked in legal formalities and inspired by nonscrupulous lawyers, often sought and "worked up" by a lawyer. Next they are inspired by some physician who with premeditation utters to a patient derogatory comment upon the treatment rendered by another physician for revenge or spite. The seed is sown and the patient hurries to a lawyer, and suit is initiated. Many suits originate from remarks and comments spoken in a careless and casual way—call it a slip of the tongue if you wish.

These factors account for the increasing number of malpractice suits in this State. If physicians would refrain from thoughtlessly criticizing before or to patients the services rendered by another physician; if physicians would cease aiding attorneys in building up cases having no merit; if physicians would decline to testify against another physician unless the evidence clearly indicated malpractice—if these three 'dont's" were lived up to there would result a rapid decrease in the number of suits.

The plea is made that every member make it a point to so conduct himself and observe this manner of conduct.

CONVENTION PLACE 1937

Before submitting recommendations to the House of Delegates as to cities where accommodations are adequate for holding our annual session, the Council makes an investigation as to local facilities. In order that this may be done, county societies desiring to be hosts for the 1937 annual session are requested to send their invitations to the State Secretary before March 15. The invitation should be accompanied by a statement imparting hotel accommodations, meeting auditoriums, exhibit halls, and attraction features.

KERN COUNTY HOSPITAL DECISION

On January 31 the Fourth District Court of Appeals rendered a decision sustaining the Kern County Superior Court in determining that county supervisors could only hospitalize indigent cases in county hospitals. Full comment on this ruling and opinion will appear in our next issue.

* * *

ANNUAL DUES

Dues for 1936 are now payable. If you have not sent in your check, will you not please do so today? Your county and state membership is a valuable asset. Do not permit it to lapse. Help lessen the work of your county secretary by prompt payment of your dues. Then go a bit farther by securing the affiliation of that associate who is eligible for membership. Invite him to accompany you to a meeting and tell him why he should join. Our 1936 goal is 6,000 members. Will you help us to attain it?

* * *

COME UP AND SEE US

The editor of the *Journal of the Indiana State Medical Association* has seen fit to reprint the following paragraph.

> The first impression the observant medical man gets in California is that there are more superannuated candidates for the cemetery than to be seen in any other section. Their presence depresses and haunts you! Go to California to live? Go there to die!!

No comment is made by the editor, but the inference can be perceived. In response the following is reprinted from our January issue:

> An eastern surgeon, a university regent, and a man who has visited many clinics and medical meetings, not only in this country but all over the world, wrote in a personal communication:
>
> "After leaving San Francisco, Mrs. S. and I went to Southern California, gaining impressions of the country in general and medical conditions in particular. Incidentally, we met a great many old friends and had a thoroughly enjoyable and profitable time. I came home with renewed and fresh impressions of the excellence of the medical service performed by the good men of the profession out there. Certainly your standards are as high as any in the country and far better than in most parts of the country, and I think all of you there can be well satisfied with what you are doing. There is a certain newness and freshness, a tendency to break away from restricting traditions, and an enterprising spirit which is very apparent to one who visits California after a period of years."
>
> If eastern men would do as this surgeon did, come and spend two or three weeks in California, see and mingle with our members and gain first-hand information—well, eyes would see the light and there would be a new and better understanding.

To those of the profession who live and die east of the Rockies, we extend a cordial invitation to "Come up and see us." And to you in Indiana we assert that if you want to be "depressed" and "haunted" do not come to California, but visit and live in South Bend, Gary, Indiana Harbor, Hammond, with their barren sand dunes, swamp marshes, smoke, odor, and inhabitants of foreign birth. But if you desire to gain a new inspiration, to rid yourself of "depression" and "haunts"—come up and see us in California and learn whereof you comment. (Other editors please copy this *friendly* retort to our Indiana and Nebraska friends.) Afterthought: If you desire to die *young*, remain east of the Rockies. In California you *live* to a ripe old age midst pleasant lines and places—where men of eighty-five years root enthusiastically without pessimism. (Now it is your turn.)

MINUTES OF SECRETARIES' CONFERENCE

On January 18 the first annual conference of county secretaries was held in San Francisco. Every county organization except one was represented. The representative from Humboldt County, much to his regret, was unable to reach San Francisco by reason of heavy rains and obstructed roads. In addition to the secretaries, all the State Association officers and majority of the Council were present.

The announced program was followed. Each speaker presented valuable, useful information and advice related to organizational work, policies, and problems. The discussions clarified and advanced the features and purposes of organization. A stenographic record of the conference is being transcribed, and will be published in the March issue.

All in all it was a red-letter day in the history of our Association. County secretaries are our key men. It is they who cause our county units to apply policies and unite members into a centralized body for the purpose of attaining all ends and objectives of organizational endeavor. At this conference these key men obtained a better understanding of the purposes of organization. They returned home enlightened and imbued with the responsibilities of their office. It can be confidently assumed that as they report to their fellow members, all of our county organizations will reveal an awakened activity that will record enhanced benefits to all members.

The Council greatly appreciates the time contributed by these secretaries in attending this conference. Members are urged to coöperate with their county officers, to the end that there may be witnessed a bigger and better State Association. Watch for the March issue for detailed report.

PIONEER PHYSICIANS IN SISKIYOU COUNTY

An interesting bit of history by a member who has been in practice fifty-eight years:

Dear Doctor Warnshuis:

Noticing a reference to myself in the November number of California and Western Medicine (Vol. 43, No. 5, p. 372), and to some physicians whose fate I knew, I pass on to you the items:

Dr. Ridgeley was a middle-aged man when he practiced in Sawyers Bar, Siskiyou County, in the early 70's. Fate unknown.

Dr. Cabaniss, a Civil War surgeon, practiced at Fort Jones, California, in the early 70's. His son is, or was, a judge in Alameda County.

Dr. Furber died in Etna, also in the early 70's.

Dr. S. S. Harwood (a former Guy's Hospital student) died in the late 80's.

Dr. Helm died in Sawyer's Bar in the 90's.

Dr. Jewell died in Fort Jones in the late 80's.

Dr. McCash practiced in Sawyer's Bar early in 1877. Left and I know no more of him.

Dr. McNulty died in Yreka about 1917. Date known by Dr. Jones.

Dr. Ream died in Yreka. Date known by Dr. J. Roy Jones.

Dr. Smith died near Etna in the 80's.

Dr. Wadsworth dead. Dr. J. Roy Jones can give data.

Dr. Cowan died in Fort Jones. Dr. J. Roy Jones can give data.

Drs. Nutting and Tebbe, deceased, were former Etnaites; the former died in Etna, the latter in Weed, California.

The first medical society in Siskiyou County was organized some time in the 80's. As Siskiyou County Medical Society, it was affiliated with the State Society and both Dr. Nutting and myself were members. Owing to the difficulties of travel it lapsed into innocuous desuetude, but later reorganized and joined the State Society. When I came to Siskiyou County the railroad only reached Redding; much of our travel was over trails (all of mine until 1882). I commenced in Sawyer's Bar in 1877, later moving to the next town—Etna. I have stayed in Etna; still practice, drive my own auto, am health officer, and enjoy perusing California and Western Medicine.

Yours fraternally,

E. W. Bathurst, M. D.

"AMERICAN FOUNDATION STUDIES IN GOVERNMENT"

The following letter from the director of the Bureau of Economics of the American Medical Association should be of interest:

A considerable number of physicians throughout the United States have already received letters from the American Foundation Studies in Government requesting that they give their views informally on the present methods of medical practice and the degree to which medicine is now fulfilling its functions.

It was stated by Miss Esther Everett Lape, member in charge, that the Foundation has nothing to prove or to demonstrate to the Foundation Board. Miss Lape claimed, furthermore, that the information requested in the letters sent the physicians is not to be a statistical study; that neither the Foundation members nor the staff in charge have any preconceived notions, plans, programs or propaganda; that the study is to be confined to an endeavor to secure from practicing physicians statements of the factors involved in medical practice, opinions as to the extent to which the practice of medicine is fulfilling its functions, and expressions of the manner in which deficiencies or shortcomings in medical practice may be corrected if, and where, found. Miss Lape informed me that the Foundation desires to secure honest, complete, and well-considered statements; and that the correspondents' names will be withheld when desired. A considerable number of replies have already been received, and thus far the majority of the replies have given permission to use their statements in any legitimate way.

It appears, from Miss Lape's statements, that the compilation of the list of physicians to be circularized has not been completed and, therefore, all states have not yet been covered, but thus far about three thousand letters have been sent out. The returns, to date, number about 10 per cent of the letters mailed. It is expected that a much larger return will be received since many physicians have asked for more time in which to formulate their replies. The final list of physicians may reach ten thousand, more or less.

The final summary and digest of opinions and ideas will be prepared as a report to be sent to the correspondents whose material is used in the report for an examination prior to the release for publication.

Miss Lape, member in charge, expressed several times during the conference her anxiety over the activities of the small group in Washington which is attempting to change completely the existing social order. She expressed feelingly deep concern over the possibility of extending these reforms into the field of medicine. She was frank in expressing her opinion that some of these reforms might be merely a passing fancy, but if applied to medicine would result in a much greater social disaster than in other fields.

Information was offered by Miss Lape to the effect that the American Foundation has been engaged in other studies, such as the press poll of views of the World Court and views on Russian recognition. In each of these studies the Foundation has reported faithfully the views expressed by the writers, but at no time has it organized any propaganda or sought any objective except to present in an educational or informative way the actual uncolored facts or opinions.

Miss Lape wished it to be understood that the American Foundation's present undertaking to secure information from physicians is a bona fide effort to study certain phases of the economics of medicine by a method that has not been previously used. She stated that the Foundation is not so much interested in particulars, *per se*, as it is in the attitudes and opinions of physicians who can speak from experience on the way in which medicine is practiced and the manner in which it is meeting its obligations. Miss Lape assured me that there were no interests in the American Foundation seeking to forward any new theory or revolutionary scheme.

Miss Lape assured me that she and the American Foundation desire to keep in close contact with the American Medical Association and will welcome any suggestions, criticisms or assistance in the present study. She stated that the Foundation will be glad to answer any questions and will place the study in the Association's hands for examination if desired.

This is a report of statements made to me by Miss Esther Everett Lape and contains none of my personal opinions.

R. G. Leland, M. D.,
Director, Bureau of Medical Economics.

POLL ON HEALTH INSURANCE

The tables impart the segregated vote by county tabulation of the returns upon the following questions submitted to the licensed physicians of California.

Questions:

1. Shall the California Medical Association endorse any legislative change in the present system of medical practice?

2. Are you in favor of compulsory health insurance?

3. Are you in favor of voluntary health insurance?

(*a*) Voluntary health insurance under a plan carried on by the State of California?

(*b*) Voluntary health insurance carried on by lay companies under legislative control.

(*c*) Voluntary health insurance carried on by some form of organization of licensed physicians of California, created by legislation?

4. Are you a member of the California Medical Association?

Interpretation of these returns can now be formulated by the individual member. The returns present an interesting picture of the composite opinion of the licensed physicians and surgeons of California.

HAPPENINGS OF THE MONTH

1. Council meeting, January 19. See important items in the minutes published in this issue, on page 120.

2. Committee on Public Relations. See report in Department of Public Relations in this issue of a conference held with representatives of medical staffs of hospitals on the question of hospital insurance. Your constructive recommendations will be welcomed.

3. San Diego Fair. Association accepts control and supervision of a separate building containing 22,000 square feet exhibit space, to be known as the Hall of Medical Science. In coöperation with the San Diego County Medical Society an outstanding educational exhibit of scientific medicine and preventive medicine is being prepared.

4. Plans for an Association sponsored program for malpractice insurance is being developed. Doctor Reinle's committee will present a full report to the House of Delegates.

5. Read editorials, Association news, and Department on Public Relations for important details of actions that are of vital interest to every member.

Result of Vote on Referendum No. 2

ELECTION OF A. M. A. AND C. M. A. OFFICERS: ANSWERS TO A LETTER

The following questions were received from a San Joaquin member. The answers sent him are published for the information of other members.

Q. Who elects the delegates to the American Medical Association and from what body are they chosen?

A. County societies elect from their membership one delegate for every fifty or major portion thereof of local members. These delegates constitute the House of Delegates of the State Association. The House of Delegates of the State Association elect the state delegates to the American Medical Association from the state members who have been fellows of the American Medical Association for a period of two or more years. California has seven national delegates who, with delegates from other states, constitute the American Medical Association House of Delegates. That body is limited to 175 delegates.

Q. Who elects the officers of the American Medical Association, and from what body are they chosen?

A. The House of Delegates, upon nominations made on the floor, elect the American Medical Association officers from those who are fellows of the Association.

Q. Who appoints the editor of the *Journal of the American Medical Association?*

A. The Board of Trustees appoints the editor. The Board of Trustees, nine in number, is the interim governing body of the national organization. It convenes four times a year. It has an Executive Committee that convenes monthly.

Referendum No. 2: Summary

Total Vote

	Yes	No
1. Shall the California Medical Association endorse any legislative change in the present system of medical practice?	1,043	1,438
2. Are you in favor of compulsory health insurance?	577	1,819
3. Are you in favor of voluntary health insurance?	1,265	905
A. Voluntary health insurance carried on by the State of California?	244	933
B. Voluntary health insurance carried on by lay companies under legislative control?	204	978
C. Voluntary health insurance carried on by some form of organization of licensed physicians of California created by legislation?	617	300
4. Are you a member of the California Medical Association?	2,089	744

COUNCIL MINUTES

Minutes of the Two Hundred and Fortieth Meeting of the Council of the California Medical Association

The following minutes were approved by the Council by mail vote.

Held in Room 214, Sir Francis Drake Hotel, San Francisco, Sunday, January 19, 1936, at 9 a. m.

1. **Call to Order.**—The meeting was called to order by Vice-Chairman Morton R. Gibbons, with the following members present: President Robert A. Peers, President-elect Edward M. Pallette, Speaker W. W. Roblee, Councilors Karl L. Schaupp, Carl Howson, Henry J. Ullmann, A. E. Anderson, A. L. Phillips, Henry S. Rogers, C. L. Emmons, Morton R. Gibbons, W. H. Kiger, C. E. Schoff, C. O. Tanner; Chairman of Public Relations Committee Charles A. Dukes, Editor George H. Kress, Secretary F. C. Warnshuis, and General Counsel Hartley F. Peart. T. Henshaw Kelly and O. D. Hamlin arrived after the meeting had convened.

Absent: Harry H. Wilson.

2. **Delegates to the American Medical Association.**—Junius B. Harris, on account of the press of other duties, submitted his resignation as delegate to the American Medical Association, as follows:

"*To the Council.*—I hereby tender my resignation as delegate to the American Medical Association for the session of 1936, to take effect immediately.

(Signed) J. B. Harris."

It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Kiger, that the resignation of Doctor Harris be accepted. Carried.

On nomination of President-elect Pallette, seconded by President Peers, F. C. Warnshuis was elected delegate to the American Medical Association for the 1936 session of the House of Delegates, in accordance with constitutional provisions.

Chairman of Public Relations Committee Dukes stated that he believed it would be impossible for him to attend the 1936 American Medical Association session and asked that his resignation be considered.

It was moved by Councilor Schaupp, seconded by Councilor Ullmann, that the resignation of Doctor Dukes as delegate to the American Medical Association be referred to the Executive Committee for consideration and action. Carried.

At this point Chairman Kelly took the chair.

2a. **Redistricting Councilor Districts.**—It was moved by Councilor Gibbons, seconded by Chairman of Public Relations Committee Dukes, that a committee of three be appointed from the Council to study the matter of redistricting councilor districts of the State and report to the Council, which shall submit recommendations thereon to the House of Delegates at the next meeting. Carried. (The committee appointed consisted of Doctors Rogers, Schoff, and Ullmann.)

3. **Ross-Loos Appeal.***—The secretary read the opinion and decision of the Judicial Council of the American Medical Association sustaining the appeal of Clifford Loos and Donald Ross.

It was moved by President Peers, seconded by Councilor Gibbons, that the secretary be instructed to send a copy of the decision to the Los Angeles County Medical Association and to advise them that upon receipt of the dues of Doctors Ross and Loos, they will be considered as members in good standing in the California Medical Association. Carried.

AMERICAN MEDICAL ASSOCIATION
535 NORTH DEARBORN STREET
CHICAGO, ILLINOIS

January 14, 1936.

F. C. Warnshuis, M. D.,
Secretary, California Medical Association,
San Francisco, California.

Dear Doctor Warnshuis:

Please find enclosed the official opinion of the Judicial Council of the American Medical Association in the case of the appeal of Dr. H. Clifford Loos and Dr. Donald Ross from the decision of the Council of the California Medical Association affirming the action of the Los Angeles County Medical Society, by which action Doctors Loos and Ross were expelled from membership.

Yours very sincerely,
(Signed) OLIN WEST.

* * *

Opinion and decision of the Judicial Council of the American Medical Association in the case of the appeal of Dr. H. Clifford Loos and Dr. Donald Ross from the decision of the Council of the California Medical Association affirming the action of the Los Angeles County Medical Association expelling said members from membership therein.

The authority of the Judicial Council in the appeal of Doctors Loos and Ross and similar cases is clearly outlined and delimited in the by-laws of the American Medical Association, Chapter IX, Section 1, in the following words:

> "The judicial power of the Association shall be vested in the Judicial Council, whose decision shall be final. . . . In all cases which arise . . . (*c*) between a member or members and the component society to which said member or members belong . . . the Judicial Council shall have appellate jurisdiction in questions of law and procedure, but not of fact."

The above constitutional limitation on any review of the merits of a case therefore prevents the Judicial Council from expressing any opinion as to the guilt or innocence of the appellants in connection with any unethical practices alleged and charged against them.

Therefore, the questions upon which this Council must render the decision are: (1) Were the appellants properly and lawfully apprised of and charged with an offense; (2) were they properly and lawfully tried; and (3) were the procedures fair, just, and without material error.

The provisions for the disciplining of members appearing in the by-laws of the Los Angeles County Medical Association are as follows:

> "Article 2, Section 5. Whenever a member of this Association is charged with a criminal offense or gross misconduct, either as a physician or as a citizen, or is charged with the violation of any of the provisions of the Articles of Incorporation and By-Laws, he shall be notified by the Board of Councilors to appear before that body within ten days to show cause why he should not be censured, suspended or expelled." "After a full hearing of the case, the Board of Councilors have power by a three-fourths vote to censure, suspend or expel the member without written or verbal explanation of its reasons, such action to be effective only after a right to appeal to the Council of the California Medical Association is given the accused."

The record shows and no denial by either appellant or respondent is made, that on a certain date the appellants were served with a notice to appear eleven days later before the Council of the Association to show cause why they should not be censured, suspended or expelled from membership. No statement of definite charges nor indication of the nature of any charges were contained in the summons. Upon receipt of the summons the appellants, by telephone, inquired from the secretary of the Association what the nature of the inquiry would be, whether they should bring their books or witnesses and whether they should be attended by their attorney. As stated by the secretary,

> "the reply was in rough terms that the Council wanted to inquire into their relationship to advertising matter, particularly the circular that had just been circulated among the teachers of the Los Angeles County schools.

---

* EDITOR'S NOTE.—References to the Ross-Loos appeal were printed in the council minutes, as follows:

Vol. 42, No. 1 (January, 1935), page 48, items 8 and 10.
Vol. 42, No. 1 (January, 1935), page 50, item 1.
Vol. 42, No. 1 (January, 1935), page 54, item 30.
Vol. 42, No. 2 (February, 1935), page 130, item 10.

> He asked me if they should bring attorneys, and I told him that usually the discussions before the Association were between members and the Council, and he asked should we want their books or witnesses, and I told him usually they were not brought, but that he could do as he wished." "My answers to him over the telephone were guided by an attempt to be as noncommittal and impersonal as I could."

Doctor Loos and Doctor Ross appeared as cited, and a report of the Association's Medical-Legal Committee was read in which definite charges were made, supported by direct statement of the committee, that the matters reported were true. Certain other matters were charged on the basis that "we are informed that." Doctor Loos and Doctor Ross denied all charges, explaining each one, and offered to bring legal evidence of the truth of their statements "if the Council wished." A general discussion developed during which matters not contained in the Medical-Legal Committee's report were included, after which Doctor Loos and Doctor Ross were excused. Following their retirement the Council voted to expel Doctor Loos and Doctor Ross, and also adopted the report of the Medical-Legal Committee.

It is a fundamental principle of American jurisprudence (1) that a person shall be considered innocent until he has been proved guilty; (2) that an accused person shall know of what he is accused; (3) that he shall have adequate opportunity to defend himself; (4) that he shall not be punished for an act not included in the charges against him; and (5) that he shall have a fair trial.

Every one of the above five principles was violated in the trial of this case before the Council of the Los Angeles County Medical Association. There is nothing in the record of this case and nothing in the hearing before the Judicial Council showing that these men had been proved guilty of anything covered by the report of the Medical-Legal Committee of the County Association.

No supporting evidence to that report was offered, and so far as the record shows, the committee, on the one hand, charged offenses and the appellants, on the other, denied them. The appellants at the time offered to submit proof of their denial, which later, in fact, they did in the form of sworn statements by officials of the organizations involved, which were presented in the appeal of the appellants to the California Medical Association. On the side of the Los Angeles County Medical Association was only circumstantial evidence sufficient to cause strong suspicion, but insufficient to convict.

No indications of what the charges were appeared in the summons to appear and show cause. The appellants tried to learn from the proper officer, the secretary of the Association, what the charges were. Instead of informing them, if indeed he knew since the report of the Medical-Legal Committee which constituted the charges was not adopted by the Board of Councilors until after the hearing was held, the secretary himself testified that he answered the inquiry "in rough terms that the Council *wanted to inquire* into their relationship to advertising matter." He also testified that in answer to the question as to whether the appellants should bring attorneys that "usually the *discussions* before the Association were between members and the Council." He carefully evaded any appearance of there being a formal trial and avoided telling them of what they were charged. They were, doubtless, lulled by the appearance of informality and dissuaded thereby from bringing supporting evidence to any statement they might wish to make by the absence of any charges in the summons and the evasiveness of the secretary in answering their inquiries as to the character of the charges. It is quite apparent that, whether guilty or not, they did not have a fair trial.

The by-laws of the California Medical Association, providing for the disciplining of the members of all its component county medical societies, are as follows:

> "Chapter 11, Section 3. No member of a component county society shall be deprived of his membership unless by his own act, except by a two-thirds affirmative vote of all the active members in good standing of the component county society to which he belongs, present and voting at a regular meeting thereof, or by a two-thirds vote of its Council or Board of Directors, present and voting at a regular meeting thereof, and only after at least six weeks' written notice personally delivered to the member has been served upon him, fully stating the charges against him, and only after such member shall have been given full opportunity to be heard in his own defense at such meeting."

The by-law of the California Medical Association is explicit, fair, just, and does not offend the principle of proper protection of the rights of membership in the county, state, and national organizations. The similar by-law of the Los Angeles County Medical Association, on the contrary, is vague, unfair, arbitrary, and fails to give adequate protection to every member of that society. At any time a small group of members having obtained positions of authority may use such authority against any member said group elects to prosecute or persecute and the member has only the protection of a time-consuming, expensive appeal to the Council of the State Association or the Judicial Council of the American Medical Association.

The California Medical Association is the creative and authoritative body over the Los Angeles County Medical Association. The County Medical Association is a unit in organized medicine because of the charter granted it by the said State Association. Therefore a by-law of the county society inconsistent and in conflict with a similar one of the State Association is null and void. The by-law of the California Medical Association, previously quoted, provides that "no member of a component society" shall be deprived of his membership except as provided therein. This covers the membership of the Los Angeles County Medical Association as well as the membership of every other component society.

It is admitted by the respondents that the whole procedure in the Los Angeles County Medical Association was irregular and prejudicial to the interests of the appellants, that they were entitled to the protection of the by-law of the State Association, but that by answering the summons, attending the meeting as directed and defending themselves against the report of the Medical-Legal Committee, they waived those rights provided by the State Association by-law. The Judicial Council is not impressed by this argument. The record shows that several times previous to this action the appellants had been called before the Society's representatives for discussion and explanation of their operations; that at no previous time had such formal notice been given and, therefore, an effort was made to learn from the proper officer what matter would be brought up, in order to be properly prepared; that appellants were lulled by that officer's evasiveness; that because of that evasiveness they were not prepared to present denial supported by legal evidence, but that they offered to obtain such evidence; that, in fact, they did produce such sworn evidence before the Council of the State Association later on. If a claim of waiver is to be made, it is the obligation of the party making the claim to show that there was an intent to waive. Such an intent cannot be assumed simply because an accused cited to appear does so appear and make general denial, and especially if the accused offers to produce further evidence by witnesses not then available to support the denials.

For the following briefly summarized reasons, viz., (*a*) the appellants were brought to trial with no definite knowledge of what they were charged, (*b*) they had no adequate opportunity to defend themselves, (*c*) they were expelled for some unknown act not appearing in the charges, and (*d*) they did not have a fair trial, which appear in full in the above analysis, the Judicial Council supports the appeal of Dr. H. Clifford Loos and Dr. Donald Ross from the decision of the Council of the California Medical Association, which affirmed the action of the Los Angeles County Medical Association expelling said physicians from membership therein.

George Edward Follansbee, M. D.
Walter Donaldson
George Noland
John H. O'Shea

January 2, 1936.

4. **Kern County Membership Appeals.** — The secretary read the notice of appeal from the action of the Kern County Medical Society Board of Directors expelling Joe K. Smith from the Kern County Medical Society and suspending J. M. Kirby and R. M. Jones for a period of fifteen years, and H. H. Rogers for a period of five years,

signed by these physicians and filed in the office of the Association.

It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Schaupp, that a committee of the Council be appointed to exert proper efforts at conciliation and compromise in the matter of these expulsions and suspensions from the Kern County Society, prior to the hearing of the appeal. Carried. (The committee appointed consisted of Doctors Howson, Anderson, and Ullmann.)

5. **San Francisco County Membership Appeals.**—The secretary reported that notice of appeal from the action of the San Francisco County Board of Directors in suspending Ferd W. Callison for a period of fifteen years, and request for hearing relative to the suspension by the San Francisco County Society of Herbert J. Cohn for a period of ninety days, had been filed in the office of the Association.

It was moved by Councilor Kiger, seconded by Councilor Ullmann, that a special committee of the Council be appointed to exert proper efforts at conciliation and compromise in the matter of suspensions from the San Francisco County Medical Society. Carried. (The committee appointed consisted of Doctors Dukes, Hamlin, and Rogers.)

6. **Date of Next Council Meeting.**—It was moved by President-elect Pallette, seconded by Speaker Roblee, that the next meeting of the Council be held at the Sir Francis Drake Hotel, San Francisco, on Saturday, April 11, 1936, at 9 a. m., and that the hearing of the appeal of Kern County members be held at 10 a. m. of said day, and the hearings of appeals of San Francisco County Society members be held at 2:30 p. m. of said day. Carried.

7. **Conduct of Hearings.**—Chairman of Public Relations Committee Dukes raised the question as to whether or not members presenting appeals might be represented by attorneys at law.

After discussion it was the consensus of opinion of the Council that members desiring to be represented by attorneys might secure such services under the limitations set forth at the hearing by the chairman of the Council.

8. **San Diego Fair Exhibits.**—The secretary reported on the exhibit to be conducted under the auspices of the California Medical Association and the San Diego Society at the San Diego Fair, and read a letter from the American Medical Association signifying its willingness to exhibit if the supervision and control was under the medical association.

Clarence G. Toland, chairman of the Association's Committee on the San Diego Fair Exhibit, presented a detailed report on the proposed exhibits and a list of participants, and stressed the necessity of supervision of the entire exhibit by someone trained in the preparation and control of scientific exhibits.

It was moved by Councilor Ullmann, seconded by Councilor Kiger, that the California Medical Association offer the services of its secretary to the San Diego County Medical Society and the Fair Management in the development of a medical exhibit and that the expenses of the secretary be paid by the Association. Carried.

9. **Malpractice Insurance.** — George G. Reinle, chairman of the Committee on Medical Defense, submitted a detailed report on the present situation of medical defense and suggested that the Council appoint a committee to make a further study of the most desirable solution of the problem.

It was moved by Chairman of Public Relations Committee Dukes, seconded by Councilor Emmons, that the Committee of Medical Defense and such advisory committee as may be appointed by it, be authorized to make a further study of the matter. Carried.

The necessity of securing aid of a trained insurance man in collection of actuarial statistics was discussed, and on motion of Councilor Gibbons, seconded by President Peers, John G. Johnson Co. was authorized to make negotiations with various insurance companies and submit a plan for medical defense insurance.

The letter designating Mr. Johnson as broker follows:

John G. Johnson Company,
San Francisco.

Gentlemen:

You are hereby appointed by the Council of the California Medical Association the sole insurance broker of the Association to devise plans and to negotiate for medical malpractice insurance, including both legal defense and indemnification to cover members of the California Medical Association.

It is understood that this is without obligation to the California Medical Association, and that no plan or policy will be effective until approved in all details, in writing, by the Council of the California Medical Association. This appointment may be terminated as set forth in our letter of transmittal.

Yours very truly,
F. C. Warnshuis, *Secretary.*

ɫ ɫ ɫ

John G. Johnson Company,
Russ Building,
San Francisco.

Gentlemen:

The Council of the California Medical Association hereby nominates and appoints you as its sole insurance broker upon the following terms and conditions and for the duration of time hereinafter stated.

1. *Services and Limitations:* In your capacity as insurance broker for the Council of the California Medical Association you are to devise plans of, and to negotiate for, insurance policies of such conditions and terms as to provide for the members of this Association, legal defense in the event that actions are brought against them for malpractice and to indemnify a member whenever such action results in a judgment for damages against him.

2. Acceptance of Policies, Terms and Premiums: Before any plan of form of malpractice insurance protection for the members is executed all the terms, conditions, procedures, coverage and policy provisions shall be submitted to the Council of the California Medical Association for its final endorsement and approval. It is specifically stipulated that this Council or any of the members of this Association shall not be under any obligation to you or any insurance carrier until final approval and agreement shall have been executed in writing by the Council.

It is further stipulated that the Council of the California Medical Association does not assume any financial obligation to you, or any insurance company for expenses that may be incurred by you or by them.

3. *Termination of Broker Service:* The Council hereby reserves the right to cancel your appointment as Association Liability insurance broker, upon written notice, whenever the Council deems that such cancellation is in the best interests of this Association and its members. It is hereby stipulated that in the event of such cancellation neither the Council of the Association nor any of its members shall be financially obligated for any services that you or your firm may have rendered.

Council of California Medical Association.
By T. Henshaw Kelly, *Chairman.*
F. C. Warnshuis, *Secretary.*

Accepted:

10. **Review Books.**—It was moved by President-elect Pallette, seconded by Councilor Kiger, that all books sent to the Association for review be retained in the offices of the Association and that the magazines received in exchange be sent to the San Francisco County Society Library and that the previous monthly payment of $15 in lieu of rent be discontinued. Carried.

11. **Medical Society of New Jersey.**—A letter from the Medical Society of New Jersey regarding a special meeting of the House of Delegates of the American Medical Association on medical economics was read and placed on file.

12. **Practice of Radiology.** — A resolution from the Pacific Roentgen Club, supporting the action of the California Medical Association that holds that all branches of radiology are the practice of medicine, was read.

The secretary read the following resolution, which was presented by the Section on Radiology of the California Medical Association:

Whereas, Certain organized lay groups in this country are endeavoring to arrange for the provision of diagnostic medical service along with and as part of hospital services; and

Whereas, The provision of such diagnostic medical services will inevitably foster fundamental changes in the practice of medicine; and

Whereas, Such changes in the practice of medicine may well result in deterioration of our present medical standards and especially in deterioration in the quality of medical care furnished to hospital patients; now, therefore, be it

Resolved, That it is the official policy of the House of Delegates of the American Medical Association that it disapproves of the division of any branch of medicine into technical and professional portions; and be it further

Resolved, That copies of this resolution shall be brought to the attention of the American Hospital Association and its affiliated groups, to the end that existing arrangements permitting division in medical practice be terminated as speedily as possible.

It was moved by Councilor Rogers, seconded by Councilor Ullmann, that the request of the Section on Radiology be complied with and that the delegates to the American Medical Association be requested to introduce this resolution at the 1936 Kansas City meeting of the House of Delegates. Carried.

13. **Association Correspondence.**—The secretary read a letter from Olin West stating that the California Medical Association letter of December 2, relating to negligence in replies to specific questions asked by this Association, had been received and would be referred to the Executive Committee and the Board of Trustees. The secretary reported that no further reply has been received to date.

14. **Lay Technicians.** — The proposed University of California Extension Course for training of lay technicians was discussed and, on motion of Editor Kress, seconded by Councilor Rogers, the matter was referred to the secretary for reference to the proper committee. Carried.

15. **Woman's Auxiliary.**—A letter from the chairman of the Committee on Associated Societies and Technical Groups asking, on behalf of the Woman's Auxiliary, for $150 for entertainment at the annual session, was read.

It was moved by Speaker Roblee, seconded by Chairman of Public Relations Committee Dukes, that $150 be given to the Woman's Auxiliary for entertainment at the annual session. Carried.

16. **Editor of the American Medical Association Journal.**—After consideration of clippings taken from the daily press and letter from a member of the Association, on motion of Councilor Kiger, duly seconded, the following resolution was adopted:

Whereas, The editor of the *Journal of the American Medical Association* is a paid employee of the Board of Trustees and the House of Delegates; and

Whereas, This employed editor has for some years been conducting a syndicated column in the local press of the country by writing articles on medicine, health and allied subjects over his name to which is appended the title of "Editor of the Journal of the American Medical Association and Hygeia," for which he receives financial returns to his own personal profit and gain; and

Whereas, The public gains the impression that in these articles the editor is the spokesman for the Association and its members and that the articles are endorsed by the Association; and

Whereas, Section XVI of the By-Laws provides that no memorial, resolution or opinion of any character whatever shall be issued in the name of the Association unless it has been approved by the House of Delegates; and

Whereas, Many of these syndicated articles of the employed editor of the Association have received adverse criticism and disapproval by lay and professional men because of their content, style and errors, thereby producing adverse reflection upon the Association; and

Whereas, The employed editor is not the spokesman of the Association or its members as he has at times stated and implied; now, therefore, be it

Resolved, That the Council and officers of the California Medical Association do hereby respectfully petition and request the Board of Trustees of the American Medical Association to take action to instruct the employed editor to immediately discontinue the use of the title "Editor of the Journal of the American Medical Association and Hygeia" after his name in his syndicated articles written for nonmedical publications; and be it

Resolved, That the Board of Trustees of the Association be requested to take the necessary action that will prevent its employed editor from capitalizing upon his position and using it for his personal financial profit; and be it

Resolved, That the Board of Trustees require its employed editor to devote his entire time to the editorial duties of that office; and be it

Resolved, That the secretary of the California Medical Association be hereby instructed to send a copy of this resolution to the chairman and the secretary and members of the Board of Trustees, secretaries and editors of the State Associations and to all the members of the House of Delegates of the American Medical Association.

17. **Health Insurance.**—A detailed tabulated report on the poll taken of all of the licensed physicians and surgeons in California upon changes in laws governing medical practice in California was submitted, and on motion duly made, seconded and carried, the report was accepted, the committee thanked for its services, and the poll declared closed.

18. **Association Headquarters.** — The secretary presented correspondence regarding the acquisition of a permanent Association headquarters.

It was moved by Peers, seconded by Roblee, that a committee be appointed to study this matter from all angles and be authorized to take an option upon the property without any down payment, and report back to the Council. Carried. (The committee appointed consisted of Doctors Kelly, Pallette, Gibbons, Roblee, and Warnshuis.)

19. **Recess.**—At this point a recess was declared for luncheon.

20. **Call to Order.**—The Council was called to order by Chairman Kelly after the recess.

21. **Committee of Five.** — Correspondence was read from Dr. W. R. Molony, chairman of the Committee of Five, stating that Professor Dodd had advised him that all materials relating to the California Medical Association's part of the survey were being forwarded to the Association offices and that final revision of the report was now being made, which would complete his responsibility to the Committee of Five.

Discussion was then had of the matter of final revision and evaluation of the report. Doctor Yoell was granted the privilege of the floor, and stressed the desirability of securing the services of Professor Canning for a final revision of the report. Further discussion followed.

It was moved by Councilor Howson, seconded by Councilor Ullmann, that the matter be laid on the table for two hours. Carried.

22. **Secretary's Annual Report.**—The secretary presented his annual report to the Council as mailed to all members thereof.

It was moved by Councilor Ullmann, seconded by Councilor Kiger, that the report of the secretary be accepted for submission to the House of Delegates. Carried.

23. **Auditing Committee Report.** — The question of transportation expense was raised, and it was the sense of the Council that the present allocation of railroad fare and lower berth be abided by.

Excerpts from the audit of the Association's accounts as prepared by Ernst & Ernst, certified public accountants, were read. The allocation to the Journal of $3 dues of the members in place of the former allocation of $2 was discussed in detail. It was pointed out that this accounted for a relative amount of loss in "Association" accounts and gain in "Journal" accounts over the previous years.

It was moved by Councilor Gibbons, seconded by Editor Kress, that the accountants be requested to change the Association books to the type used by a nonprofit organization. Carried.

It was moved by Councilor Gibbons, seconded by Speaker Roblee, that the expense incurred by the president and the president-elect in visiting county societies be approved for payment by the Association. Carried.

24. **Scientific Sections of the Association.**—The secretary recommended, upon suggestion of the Scientific Committee and Section officers, that a study be made of the Scientific Sections of the Association with a view of reorganizing the same.

It was moved by President-elect Pallette, seconded by Phillips, that a committee survey this matter and report to the Council, who will in turn make recommendations for submission to the House of Delegates. Carried. (The committee appointed consisted of Morton R. Gibbons, L. A. Goin, L. P. Adams, John Ruddock, and Fred Gundrum.)

25. **Funds of the Association.**—It was moved by Councilor Kiger, seconded by Councilor Emmons, that the Association and revolving funds of the Association be deposited in the Crocker First National Bank.

26. **Budget.**—The chairman of the Auditing Committee submitted the budget of the Association for the year 1936-1937.

It was the sense of the Council that the expense of the various departments be broken down and shown each under one subheading in the budget.

It was moved by Councilor Gibbons, seconded by President-elect Pallette, that the budget as submitted with the emendations suggested be approved by the Council for submission to the House of Delegates. Carried.

27. **Qualifying Certificate Act.** — George H. Kress, chairman of the Special Committee on the Qualifying Certificate Act, submitted the minutes of the meeting of his committee, which was held on December 14, 1935.

It was moved by Editor Kress, seconded by Councilor Gibbons, that the proposed enactment of a qualifying certificate act by initiative petition be postponed until the November, 1938, election. Carried.

On motion of Pallette, seconded by Ullmann, the following resolution was submitted to the Council for action:

WHEREAS, The referendum vote of the California Medical Association members on a proposed Qualifying Certificate (Basic Science) law showed that about 90 per cent of the physicians who cast ballots were in favor of such initiative law; and

WHEREAS, Because of the new registration laws, an initiative cannot be submitted to the electorate until November, 1938; now, therefore, be it

Resolved, By the Council of the California Medical Association that the sum of $35,000 be set aside from the funds of the Association as a separate fund to be earmarked for use in the November, 1938, State election, at which time the proposed Qualifying Certificate Law will be placed on the ballot.

A vote on the question was called for, and there being a division of opinion Doctor Schoff called for a vote by roll call.

Noes: Doctors Peers, Roblee, Kelly, Schaupp, Emmons, Ullmann, Anderson, Phillips, Hamlin, Rogers, Tanner, Gibbons, and Harris.

Ayes: Doctors Pallette, Howson, Schoff, and Kiger.

There being thirteen noes and four ayes, the motion was declared defeated.

28. **Disciplinary Procedure.** — William Roblee, chairman of the Committee on Disciplinary Procedure, presented the report of his committee. The proposed by-laws embodying rules of ethics and procedure were then considered, section by section.

It was moved by Councilor Gibbons, seconded by Councilor Emmons, that any member of the Council who had further suggestions for the by-laws and rules for disciplinary procedure submit same to the committee within the shortest time possible, and that the committee submit a final report to the next Council meeting. Carried.

29. **Foreign Exchanges.**—On motion of Councilor Ullmann, seconded by Councilor Rogers, the Council directed that foreign exchanges be discontinued. Carried.

30. **Publication of Nevada Papers.**—The editor was authorized to use his discretion on publication of papers received from the Nevada Association, maintaining the same quality standard as is observed in acceptance of papers from California authors.

31. **Journal to American Medical Association Delegates.**—It was moved by President-elect Pallette, seconded by Councilor Kiger, that, for one year, CALIFORNIA AND WESTERN MEDICINE be sent to all members of the House of Delegates of the American Medical Association and to the American Medical Association trustees. Carried.

32. **Roster of Association.**—It was moved by Councilor Schaupp, seconded by Councilor Anderson, that a roster of members of the California Medical Association be published in the JOURNAL as heretofore. Carried.

33. **Special Societies.**—Discussion was had of the inclusion of special societies in the list of organizations published in the forepart of the JOURNAL.

On motion duly made, seconded and carried, it was ordered that organizations applying for such listing be advised that it is the policy of the Association not to publish lists of any special organizations.

34. **Complimentary Journals.**—It was moved by Editor Kress, seconded by Councilor Kiger, that Lionel Browne, attorney for the State Board of Health and the Board of Medical Examiners, be placed on the complimentary mailing list of the JOURNAL. Carried.

35. **Annual Session.**—The secretary stated that, due to illness, Dr. Tate Mason may be unable to attend the annual session as an invited speaker.

Full discussion was had of entertainment at the annual session.

It was moved by Councilor Gibbons, seconded by Councilor Ullmann, that the matter of expenditure for entertainment at the annual session at Coronado be left in the hands of the secretary and the local Committee on Arrangements. Carried.

36. **Public Relations Department.**—The secretary reported for the committee chairman that the Committee on Public Relations and representatives of the various hospitals in California had met and discussed hospital service under Assembly Bill 246 and that the hospital representatives and the radiologists are to form a committee to meet with the Public Relations Committee for the purpose of formulating a state policy regarding hospital and laboratory services in connection with hospital insurance.

37. **Committee of Five.**—It was moved by Councilor Ullmann, and seconded by Councilor Gibbons, that the matter of securing the services of Professor Canning to assist in the final revision of the survey report be removed from the table.

Doctor Schoff stated that he wished to go on record as suggesting to the Committee of Five that Doctor Canning be employed, but that the matter be referred back to the Committee of Five for any action.

It was moved by President-elect Pallette, seconded by Councilor Emmons, that the matter of securing the services of Professor Canning be returned to the table. Doctors Schaupp and Gibbons voted in the negative. There being a division of opinion the chair called for a vote by roll call.

Ayes: Doctors Pallette, Roblee, Emmons, Howson, Ullmann, Anderson, Phillips, Hamlin, Kiger; Harris (with right to explain his vote).

Noes: Doctors Kelly, Schaupp; Schoff, qualified with "No" on tabling because he wants to have the matter go back to the Committee of Five; Rogers, Gibbons.

Ten votes to table being cast in the affirmative and five in the negative, the matter of securing the services of Doctor Canning was returned to the table.

Doctor Harris then explained his affirmative vote, stating that he did not wish to bury the report, but that he thought this was the wrong time to employ Professor Canning and that he believed this matter should go back to the Committee of Five and that a stimulating committee should be appointed to act with the Committee of Five.

It was moved by Councilor Harris, seconded by President-elect Pallette, that a committee of three, consisting of Doctors Kelly, Pallette, and Roblee, be appointed to act with the Committee of Five, to the end that this survey report be placed in its final form at the earliest possible moment. Carried.

38. **Legal Department.**—The general counsel reported on the present status of the case of *Pacific Employers* vs. *Insurance Commissioner,* and *Francis* vs. *Nelson.*

The general counsel stated that he had received a letter from the American Medical Association wherein Doctor Woodward did not agree with the contentions made by the California Medical Association regarding exemption of physicians from income tax.

39. **Farm Bureaus.**—Doctor Rogers outlined activities of the various Farm Bureaus and stated that speakers had been furnished for lay meetings on several occasions and that through the coöperation of the secretary additional speakers would be furnished in the future.

40. **Tax-Supported Hospitals.** — Dr. Anderson, chairman of the Committee on Tax-Supported Hospitals and Medical Services, stated that the committee was gathering information and that questionnaires had been received and were now ready for tabulation and that a further progress report would be submitted.

41. **Cancer Commission Report.**—Dr. Ullmann stated that many requests had been received for copies of the report of the Cancer Commission and that the Commission desired to have additional reprints made for resale at 75 cents per copy.

It was moved by Councilor Ullmann, seconded by Councilor Harris, that the secretary of the Association be authorized to secure reprints of the report of the Cancer Commission on the basis of the bid submitted by Stacey, subject to the approval of the Auditing Committee of such expenditure of funds. Carried.

42. **Adjournment.**—There being no further business, the meeting adjourned.

T. Henshaw Kelly, *Chairman.*
F. C. Warnshuis, *Secretary.*

COMPONENT COUNTY MEDICAL SOCIETIES

FRESNO COUNTY

The months of December and January have been busy days for the officers and members of the Society. Under the leadership of our new president, Dr. Kenneth Staniford, several new projects have been launched by the Society. The Woman's Auxiliary has been definitely organized and is now under way as an important aid to the Society.

On December 12, 1935, the Board of Directors met in special session with representatives of the American Red Cross. After listening to arguments from the Red Cross, the Board finally approved the organization of a well-baby conference, to be conducted in a section of Fresno where infant mortality is high and medical service inadequate. The Red Cross pledged a rigid social servicing of all applicants to the conference.

The regular meeting of the Society took place on January 7 at the University-Sequoia Club. Dinner preceded the meeting, which was well attended. Following the showing of some interesting African films by Mr. John Cooper, the scientific program was presented by Dr. Alson Kilgore of San Francisco. His subject was the *False Acute Abdomen.* Doctor Kilgore discussed in detail the differential diagnosis of the acute surgical and nonsurgical abdomen. His paper was intensely interesting and enjoyed by all those present.

On January 16 the Board of Directors again held a special meeting with the Committee on Hospitals and the Committee on Public Policy and Legislation. The purpose of this meeting, in the main, was to discuss the hospital insurance plan, which has again come to life by virtue of recent legislation in favor of this means to reduce the costs of medical care. The committees were instructed by the Board to review in detail the plan already approved by the Society some time ago, and if deemed feasible to report back with their recommendations to the next board meeting. It is then planned to present the proposed project to the Society, which, if approved, will be put in working form and offered to the public.

The Board of Directors, at this meeting, also went on record as endorsing the efforts of the local committee for the President's birthday ball in combating poliomyelitis, and instructed the secretary to give a radio address on January 18 relative to the Society's approval of the antipoliomyelitis campaign.

Henry A. Randel, *Secretary.*

HUMBOLDT COUNTY

The Humboldt County Medical Society held their regular meeting on the evening of December 18, 1935, at the St. Joseph's Hospital, President Charles C. Falk, Jr., presiding.

The applications of Francis H. O'Neil, Joseph M. Brown and Thomas F. Thorp, having been reported upon favorably by the State Society, were received into the local society. A resolution was passed and forwarded to Governor Merriam, urging the Governor to reappoint Dr. Charles B. Pinkham as a member of the State Board of Medical Examiners.

Ten-minute talks were given by the following members of the American College of Surgeons: Lane Falk, G. F. Norman, B. M. Marshall, O. R. Myers, and Charles C. Falk, Jr.

Election of officers for 1936 was held, with the following results: Joseph S. Woolford, president; Allan R. Watson, vice-president; John A. Lane, treasurer; Lawrence A. Wing, secretary; Lane Falk, delegate; Wilson Stegeman, alternate.

* * *

The Humboldt County Medical Society held its regular monthly meeting on January 16 at the Eureka Inn. There were twenty members present, and two guests—Doctors Albert V. Pettit and George Ward of San Francisco. President J. S. Woolford presided, and Dr. Lane Falk was chairman of the day.

Due to the fact that reports of our monthly meetings did not get into the Journal more regularly, on motion we changed our regular meeting night from the third Thursday to the first Thursday, thereby giving time to get a report in the issue of the same month.

The Society was the guest of Dr. Lane Falk at a crab luncheon, followed at three o'clock by special pictures and discussion on the lower abdominal and pelvic cavities. In the evening at eight o'clock, Doctor Pettit, assisted by Doctor Ward, presented the main paper—*The Principles which Lie Behind Certain Operations of the Abdominal and Pelvic Cavities, as of the Suspension of the Uterus, Vaginal Suspension of the Stump, Trachelorrhaphy, Cystocele, Enterocele and Pelvic Inflammations.* Discussion of the above paper was given by Doctors O. R. Myers, Lane Falk, J. F. Walsh, and Charles Falk, Jr. The Society was very grateful to Doctors Pettit and Ward for putting on such a splendid program, especially due to the fact of facing such a storm, taking two days to reach Eureka.

The next meeting, in February, will be a joint meeting with the dentists. A speaker from the Public Health League will address us.

Lawrence A. Wing, *Secretary.*

SACRAMENTO COUNTY

The regular annual business meeting of the Sacramento Society for Medical Improvement was called to order by the president, Orrin S. Cook, on the evening of December 17, 1935, at the Elks Temple. Thirty-five members were present.

Election of officers for 1936 resulted as follows:

Board of Directors—Doctors Cook, MacDonald, Van-Den Berg, Ankele, Scatena, Wallerius, Hale, Dozier, and Pollock.

Delegates—Doctors Hale and Scatena were elected to serve as delegates for the years 1936 and 1937.

Alternates—Doctors Cook and Christmas were elected to serve as alternates for the years 1936 and 1937.

Dr. Norris R. Jones was elected secretary-treasurer.

Moved and seconded that Dr. W. K. Lindsay be made an honorary member of this society, subject to action by the California Medical Association. Passed.

Frank Warne Lee, *Secretary.*

⁂

SAN BERNARDINO COUNTY

The meeting of the San Bernardino County Medical Society was held at the San Bernardino County Charity Hospital on Tuesday, January 7, at 8 p. m. The meeting was called to order by the president. About seventy-five members and guests were present.

The president called attention to the special meeting with the Riverside County Medical Society on January 13 for the purpose of meeting with the State Association officers.

The following names were voted on and approved for membership: Drs. Clarence W. Dail, Aumond D. Meyers, and Edwin H. Shryock. Loma Linda; Marcus D. White, Ontario.

Mr. H. P. Thoreson, County Director of SERA, spoke briefly on the shortage of funds, beyond their control, and asked the panel physicians to coöperate in every way to help control expense.

The secretary announced the unfortunate and untimely death of Dr. John A. Graham of Barstow. The following resolution was approved:

> Whereas, It has pleased the Almighty God to take from our midst our beloved and highly respected colleague, Dr. John A. Graham; and
>
> Whereas, This Society feels most deeply the loss of one of its outstanding members; now, therefore, be it
>
> *Resolved,* That the San Bernardino County Medical Society extend to the bereaved family this expression of its deep sorrow and most sincere and heartfelt sympathy, and that this resolution be spread upon the minutes of the Society.

The program of the evening was then given as follows: *Cancer of the Breast,* a symposium by the American Society for the Control of Cancer, Dr. John H. Flude, western field representative. Discussion by Drs. C. G. Hilliard, J. A. Patterson, C. C. Owen, P. M. Savage, Sr., C. L. Emmons, and John C. Staub, Jr.

A. E. Varden, *Secretary.*

⁂

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held on January 9.

The meeting was preceded by the customary supper meeting at the Hotel Wolf, called to order at 6:15 p. m., at which there were twenty-two in attendance. Dr. Sam Hanson presented a very interesting paper on *The Occurrence and Management of Persistent Occiput Posterior.*

The regular meeting was called to order at 8:15 p. m. by the retiring president, C. A. Broaddus.

The petition for membership of Dr. John Rosasco being favorably acted upon by the Admissions Committee, and there being no objections on the floor, he was elected to membership. The petitions for membership of Doctors Green, Hooker, Peterson, DenDulk, and Baron were read and referred to the Admissions Committee.

Dr. A. L. Van Meter reported on the status of the postgraduate study course, stating that the balance on hand in the treasury at the termination of the course could be used in 1936 possibly to bring some man from the East to present a series of talks. Dr. R. T. McGurk moved that the Society go on record thanking the membership of the Postgraduate Study Committee for their efforts in presenting the postgraduate course. This was seconded by Doctor English, and the motion carried. Doctor Fitzgerald moved that the secretary write a note of appreciation to all of the men who presented papers to the postgraduate study course. Carried. The certificates of completion of the postgraduate study course were then presented by President C. A. Broaddus.

The papers of the evening were presented by Dr. E. Butler, who spoke on *Aid to Diagnosis in Wounds in the Abdomen* and *Recent Advances in the Treatment of Poisons.* Both papers were very enthusiastically received and presented a wealth of information on the handling of emergency cases. The discussion was participated in by Doctors Chapman, McGurk, Powers, Griner, McNiel, H. Smythe, and Van Meter.

There being no further business to come before the Society the meeting was declared adjourned at 9:30 p. m. and refreshments were served.

G. H. Rohrbacher, *Secretary.*

⁂

SAN LUIS OBISPO COUNTY

At the annual meeting on December 28, 1935, the San Luis Obispo County Medical Society elected the following officers: L. T. Wade of San Luis Obispo, president; Charles Kennedy of Paso Robles, vice-president; F. W. Yocom of San Luis Obispo, secretary-treasurer; C. J. Teass of San Luis Obispo, delegate; D. A. Crew, alternate.

Board of Directors—F. C. Mugler, Ira Bartle, of San Luis Obispo, and A. H. Wilmar of Paso Robles.

The dues for the ensuing year were set at $15.

The above election followed the annual dinner at the Paso Robles Hotel. During the business meeting the Woman's Auxiliary to the San Luis Obispo County Medical Society held its annual meeting.

The following telegram was sent to Governor Merriam on January 3:

"The San Luis Obispo County Medical Society unanimously requests that you reappoint Dr. Charles B. Pinkham as a member of the State Board of Medical Examiners."

Frank W. Yocom, *Secretary.*

⁂

SANTA BARBARA COUNTY

The annual banquet meeting of the Santa Barbara County Medical Society was held at the Hotel Mar Monte, Monday evening, January 13, President E. K. Shelton presiding. There were present seventy members and thirteen guests.

During the interval preceding the banquet, cocktails were served, and the tellers distributed and collected the ballots for the annual election.

During the dinner course the assembly was most enjoyably entertained by Dr. Henry Profant and his group with instrumental music and songs.

At the conclusion of the dinner the president announced the election of the following officers for the ensuing year: P. A. Gray, president; Irving Will, vice-president; H. G. Hanze and C. G. Baird, vice-presidents-at-large; W. H. Eaton, secretary-treasurer. Delegates to the State Association convention (two-year term), Hugh Freidell and Rodney Atsatt. Alternates, Richard Evans and H. E. Henderson. Council, Hugh Freidell, H. E. Henderson, and O. C. Jones.

After brief remarks by retiring President Shelton and incoming President Gray, the speaker of the evening, Dr. A. Th. Polyzoides of the University of Southern California was introduced. Doctor Polyzoides' subject, *The Rising Importance of the Pacific Area,* was discussed most ably and interestingly, and brought forth many facts of extreme importance regarding our future relations with the Orient. The discussion was most timely and greatly enjoyed by all.

Guests of the Society, Doctor Grimm of the dental society and Mr. Ross of the Bar Association, were then called upon for brief remarks.

Upon balloting, Dr. J. Kenneth Patterson was unanimously elected into the Society.

Dr. Charles Baird, representing the Santa Maria branch of the county society, extended an invitation that the May meeting of the Society be held in Santa Maria. The invitation was unanimously accepted.

W. H. Eaton, *Secretary.*

SISKIYOU COUNTY

The regular meeting of the Siskiyou County Medical Society was held at the Yreka Inn at Yreka on December 15, 1935. The meeting was called to order by President J. R. U. Campbell.

A letter was read from the State Board of Medical Examiners stating that Doctor "Tinker," who has been practicing in the city of Mount Shasta without a license, had been warned to discontinue such practice under penalty of criminal prosecution.

A card was received stating that Doctor McCann, who was formerly at McCloud, had transferred to the Upper Mississippi Medical Society.

It was moved, seconded and passed, that a petition be sent from this society to Governor Merriam requesting that he reappoint Dr. Charles B. Pinkham as secretary of the State Board of Medical Examiners.

Moved, seconded and passed, that a letter of commendation be sent to Doctor Seeley (who has moved to Redding) for his untiring efforts as secretary-treasurer during the past year.

Election of officers was held and the following were elected to office: C. C. Dickinson of McCloud, president; Doctor McGuire of Mount Shasta, vice-president; E. F. Carlson of Fort Jones, secretary-treasurer.

A round-robbin discussion of interesting cases and their treatment was then carried out. The next meeting will be held at Mount Shasta City on January 26.

E. F. Carlson, *Secretary.*

⁂

SOLANO COUNTY

A regular meeting of the Solano County Medical Society was held Tuesday evening, January 14, at eight o'clock at the Casa de Vallejo Hotel.

After dinner, routine business was transacted.

Dr. M. Elizabeth Jenkins was elected to membership in the Society.

Dr. A. V. Doran of Vallejo introduced the guest speaker of the evening, Dr. Hans Lisser, clinical professor of medicine at the University of California. The title of Doctor Lisser's talk was *Adrenal Cortical Syndromes, with Mention of Cushing's Disease, and Arrhenoblastoma.* The subject was very interesting and greatly enjoyed by all the doctors present.

In addition to members of the Solano County Medical Society, guests from Mare Island, Crockett, Benicia, Napa, and from the Napa State Hospital were present.

John W. Green, *Secretary.*

⁂

SONOMA COUNTY

The Sonoma County Medical Society met on January 9 at the Occidental Hotel in Santa Rosa. Twenty-five members were present.

Dr. E. B. Shaw of San Francisco addressed the Society on *Communicable Diseases,* stressing recent ideas of prophylaxis. His paper was well received, and our members were impressed with the excellent presentation of a very interesting subject.

A short discussion concerning the care of the indigent sick was held during the evening.

Clifford M. Carlson, *Secretary.*

⁂

STANISLAUS COUNTY

The regular monthly meeting of the Stanislaus County Medical Society was held at the Hotel Modesto on December 13, 1935, with thirty-two members present. A splendid dinner was served by the management of the hotel.

We had as our guests, Dr. Robert Peers, president of the State Medical Association; Dr. Frederick C. Warnshuis, secretary of the State Medical Association; and Dr. Axcel E. Anderson, district councilor.

Following the dinner a motion was made by Dr. Hans Hartman that, inasmuch as it was Doctor Peers' sixtieth birthday, the Society should extend to him some remembrance in honor of the occasion. Therefore, he moved that Doctor Peers be made an honorary member of the Stanislaus County Medical Society. The motion was seconded by Doctor Morris, and the secretary was instructed to cast a ballot for a unanimous election of Doctor Peers. Motion carried. The secretary announced Doctor Peers elected.

Application of Dr. Hoyt Gant for membership was presented. Moved by Doctor DeLappe, and seconded by Dr. Hans Hartman, that Doctor Gant be accepted to membership. Motion carried.

Doctor Maxwell gave a report regarding Mrs. King, public health nurse. . . .

There being no further business to come before the meeting, President Allen introduced Dr. Robert Peers. In opening his address, Doctor Peers said: "Fellow members of Stanislaus County—You have given me the most wonderful and acceptable birthday gift. I shall always remember and cherish your kindness and courtesy as well as the good fellowship that has already been expressed." Doctor Peers then spoke upon the work of the State Medical Association and dwelt upon the betterment of its present conditions. He reported thirty-nine societies representing 90 per cent of the eligible physicians and surgeons. These members elect the House of Delegates, which is the governing body; therefore, the House of Delegates represents 90 per cent of the physicians and surgeons of the State. He stressed the necessity of reading California and Western Medicine, with special emphasis on the editorials, for there are to be found problems of organized medicine. In closing, he stated that each and every member having any problems to consider should feel free to consult the councilor of his district, for in this way the district becames a constructive unit of a cohesive State Association.

Dr. Axcel Anderson, councilor of this district, was the next speaker. Doctor Anderson spoke at some length on the report of the State Committee on County Hospital Problems. He also called to our attention the present and ever-increasing problems of aid to superannuated physicians, saying that he believed this problem was becoming more and more a vital one, and asked that this society and all others give it earnest consideration.

Doctor Warnshuis was next introduced. He first paid tribute to Doctor DeLappe, retired councilor of this district, for his long sincere services to the medical profession of this State. Doctor Warnshuis spoke at length on the progress of medicine, stating that through postgraduate work only could the modern physician keep abreast of the times. Medical society meetings are of the most extreme importance, and the present proposed extension course should be of great value to all of the medical profession. He next touched upon liability malpractice insurance. He stated that one of the companies would increase its rates 20 per cent on January 1, 1936, and that there has been a 300 per cent increase in the rates of this type of insurance in Los Angeles County. Also that the State of California is paying 50 per cent higher rates than our brethern on the eastern seaboard. There should be a report early in January by the State committee investigating this problem, with the idea in mind of supplying through the State Association, malpractice liability at cost to its members. Doctor Warnshuis advised all members to avail themselves of the present legal protection that the State Society now furnishes.

Doctor McPheeters expressed his appreciation of the above service and stated that this legal protection had saved him a great deal of worry and costs.

The Stanislaus County Medical Society, through its president, expressed to all the speakers its appreciation of their time and individual effort that they had so gladly and gratuitously given.

E. F. Hagedorn, *Secretary.*

TULARE COUNTY
KINGS COUNTY
(Joint Meeting)

The final 1935 meeting of the Tulare County Medical Society was held at Motley's Café, Visalia, at 6:30 p.m. on December 22, 1935. Dinner preceded the meeting.

The Kings County Medical Society met with us by invitation to hear the reports of the State Society officers, who were our guests on this evening. President Ray Rosson presided. President Chamlee of the Kings County Medical Society responded for the visitors. The meeting was then turned over to the State officers, who were the guests of honor.

Robert Peers, president of the State Medical Association, reported on his plans of visiting every county society in the State and discussed the workings of the State Association.

District Councilor A. E. Anderson of Fresno outlined the county hospital survey program and submitted a preliminary report of the work done.

Dr. F. S. Warnshuis, state secretary, spoke of the State Association's activities in regard to: (*a*) Postgraduate conferences. (*b*) Program of educating the public on medical problems through corps of speakers for various public groups. (*c*) Recent developments on hospital insurance, and increased premiums for malpractice insurance; and urged us all to read the official publication of the California Medical Association, to keep abreast of problems of organized medicine in California.

Dr. LeRoy Briggs, professor of clinical medicine at the University of California Hospital, delivered the scientific paper of the evening. The *Clinical Significance of Jaundice as a Symptom* formed the subject of his paper, which was most ably presented. A rising vote of appreciation was extended Doctor Briggs for his talk and willingness to answer the many questions at its conclusion.

At the close of the clinical program a regular business session took place. Various communications were read. A motion was made by Doctor Lipson to urge the reappointment of Dr. Charles B. Pinkham to the State Board of Medical Examiners, and instructions given to forward a copy of this resolution to Governor Merriam. The motion was seconded and carried.

A motion by Doctor Ginsburg was carried to reinstatc Doctor Zeller.

Nomination and election of officers for 1936 was next in order, and resulted as follows: J. C. McClure of Lindsay, president; John Fillmore of Strathmore, vice-president; K. F. Weiss of Visalia, secretary-treasurer. Censors, Doctors Tourtillott (1937), Ginsburg (1938), Ray Rosson (1939). Delegate, Ray Rosson of Tulare. Alternate, K. F. Weiss of Visalia.

Dues for the year 1936 were voted to be left as formerly—$10, California Medical Association; and $10, county society.

An unusually large attendance marked this meeting. Members and guests present included Doctors Gronemiller, Murphy, Bridgman, Chamlee, Fillmore, Tourtillott, Nicholson, A. Miller, Preston, Newbecker, P. Miller, Hellbaum, Brigham, Watke, Matthias, Crawshaw, Charles Rosson, Winns, Falk, Neal, Lipson, A. E. Anderson, Robert Peers, Ray Rosson, F. C. Warnshuis, Weiss, LeRoy Briggs, Ginsburg, E. C. Bond, Guido, McClure, Betts, and Parkinson.

Doctor Rosson then closed his 1935 term of office by thanking the members for their support during the year.

Karl F. Weiss, *Secretary.*

CHANGES IN MEMBERSHIP

New Members (17)

Alameda County.—Emery R. Ranker, Thomas Hubert Reiss.

Napa County.—Frank X. McGreane.

San Bernardino County.—Justin W. Neighbor, Marvin K. Paup.

San Diego County.—J. Aston Jetton, James R. Matson, Horace G. Merrill, Rufus A. Schneiders, John W. Warren.

San Joaquin County.—J. L. Rosasco.

San Luis Obispo County.—Justin A. Frank.

Santa Clara County.—Thomas H. Boone, Howard George Diesner.

Solano County.—Herman B. Perkins.

Stanislaus County.—Hoyt R. Gant.

Tulare County.—Harry Falk.

Transferred (3)

Peter Paul Baron, from Siskiyou County to Alameda County.

Orta Edward Kuhn, from Napa County to San Joaquin County.

Leslie D. Trott, from Los Angeles County to Orange County.

Resigned (4)

J. W. Calkins, from Alameda County.
Edmond W. Parsons, from San Francisco County.
H. Schwartzman, from Alameda County.
Reuben S. Zumwalt, from San Francisco County.

In Memoriam

Dubois, Charles Warren. Died at Los Angeles, December 17, 1935, age 33. Graduate of Cornell University Medical College, Ithaca, New York, 1927. Licensed in California in 1930. Doctor DuBois was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✠

Graham, John Alexander. Died at Los Angeles, January 2, 1936, age 59. Graduate of the Chicago College of Medicine and Surgery, 1915. Licensed in California in 1923. Doctor Graham was a member of the San Bernardino County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✠

Rathbun, William T. Died at Colusa, December 28, 1935, age 66. Graduate of the University of California Medical School, San Francisco, 1892. Licensed in California in 1893. Doctor Rathbun was a member of the Yolo-Colusa-Glenn County Medical Society, the California Medical Association, and the American Medical Association.

✠

Wheeler, Ira Abbey. Died at St. Helena, January 2, 1936, age 75. Graduate of the California Eclectic Medical College in 1894, and licensed in California the same year. Doctor Wheeler was a member of the Sonoma County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS[†]

Wishful Thinking

In seeking solution for confronting problems in government, legislation business and social activities, satisfactory plans for reform are delayed because of a very wide tendency toward wishful thinking on the part of all peoples. There is much talk and harangue, but very little thinking. And among those who have attempted to think the nature of thought follows wishful lines. A wish is expressed and advanced as a solution, but right there the effort ends. Wishes will never bring about solution. Effort must be recorded.

[†] The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

Basic interests are common and action must be revealed ere the eleventh hour has struck. Petty differences must be put aside. United organized effort must be made to gather up the dragging reins of government business and social security and to take our place in the driver's seat.

Protests against "crackpot" social and economic legislation: denunciation of irresponsible legislators and unscrupulous public officials and politicians is useless unless it results in united action, and action will not be enlisted till the wishful thinker becomes a positive thinker. Impelled by a positive purpose, united, then by action society can rid itself of evil things, business can go on its way to prosperous days, and government will be directed and administered by citizens that are capable, competent, efficient and honest.

Local, state, and national elections are near at hand. Candidates for many elective offices are being groomed and assuming positions in the election race. Politicians are building their fences and planning for the spoils. Mr. Voter is only wishfully thinking when positive action is needed.

Our 5,400 members can exert a wholesome influence upon more than three-quarters of a million voters and cause them to become positive thinkers united to become positive workers for reform in all avenues of life. More will be said about this later.

Just now the urge is that you assume a positive rôle prepared to enlist for united action. Decline to pledge support for any candidate until you have been reliably informed as to his capability, integrity, and stand upon the questions of the day. At an early date you will be enlightened as to certain positive movements that will bring relief from present intolerable conditions and your active support will be solicited.

* * *

Expert Testimony

One does not have to go far to secure evidence that under legal procedure personal injury cases are not settled by a dispassionate jury inquiring into facts. It is evident that these cases are "built up" to maximum effectiveness. We are all more or less informed as to how expert testimony is introduced and how it is given consideration by a jury. It can be stated, as did a lawyer addressing the law class in Harvard, that "the present mode of procedure, in so far as medical testimony is concerned, is not a particularly edifying one." In place of reforms in court procedure in personal injury cases the situation is becoming more and more intolerable.

Now come F. E. Elliott and Ramsay Spillman, who advance a method and plan to correct this miscarriage of equity and justice. In the October, 1935, issue of the law journal—*Law and Contemporary Problems*—they cite many abuses and review the whole subject. They conclude with these recommendations!

1. Case to be heard by a tribunal of three—one judge, a medical man, one layman.
2. Eliminate present contingent fees of the attorney. Let the court determine the value of an attorney's services.
3. Impose a penalty upon an attorney who brings an action for which there are no reasonable grounds.
4. Develop standards for use in determining degree and consequences of personal injury.
5. Limit medical testimony to fundamental facts.
6. Experts are to be employed by the court and become servants of the court in expressing opinions.
7. Experts can only be questioned by the court.

As they are discussed these proposals create a strong appeal and a desire to bring about their initiation in a problem that calls for reform. To that end members are invited to send in their comments. If sufficient interest is manifested the Committee on Public Relations will then undertake to see how this reform may be accomplished in the courts of California. Please send us your reactions and comments.

* * *

Important "Dont's"

If members will learn to observe the following advice they will save themselves from much trouble:

1. Don't assign accounts to a collection agency until you ascertain the standing and reputation of the agency. This department will be glad to inform you.
2. Don't fall for "directories" that promise you business if you will pay a certain sum for listing your name.
3. Don't take out an insurance policy because you are given a promise of appointment as a medical examiner or member of their panel of physicians.
4. Don't operate on a minor without written consent of the parent or guardian.
5. Don't perform a sterilization operation on a minor without a *court order*. On those who have attained their majority, secure written consent.
6. Don't operate on anyone without a clear and full understanding as to the nature of the operation. See *The Journal of the American Medical Association*, p. 33, January 4, 1936, issue for forms for consent for operations, examinations, and autopsy.
7. Don't sue for an account till the period of limitations has expired.
8. Don't report on services rendered to life insurance companies without patient's consent. Obtain fee for these reports from the company.
9. Don't make affidavits until you know their purpose.
10. Don't fail to obtain consultation or advice when you are in doubt.
11. Don't employ lay technical x-ray and laboratory persons. Use licensed physician's laboratories.
12. Don't violate patients' confidential physician-patient relationship.
13. Don't fail to keep complete accurate records.
14. Don't be an easy mark in falling for agents' representations.
15. Don't sign till you know what you are signing.
16. Don't fail to consult your investment banker before investing in any business or promotion scheme.
17. Don't prescribe narcotics for transient persons.
18. Don't sign a death certificate if you have not seen the patient within thirty-six hours before death. Call the coroner.
19. Don't neglect carrying indemnity defense insurance.
20. Don't break the Golden Rule.

* * *

Conference with Chiefs of Medical Staffs of Hospitals

On January 18 the Committee on Public Relations held a conference with representatives of hospital medical staffs. The purpose of the conference was to accomplish the formulation and acceptance of a state-wide policy in regard to what shall be incorporated in "hospital service" in any plan of hospital insurance authorized under Assembly Bill 246, passed by the last legislature.

Some fifty representatives attended. Profitable discussions and suggestions ensued in the two-hour session. The conference concluded with the appointment of three representatives of the hospitals and of the laboratory directors who will meet at an early date with the Committee on Public Relations for the purpose of drafting a state-wide policy. When this is accomplished, due announcement will be made.

* * *

Minutes of the Meeting of the Committee on Public Relations, January 18, 1936: Conference with Hospital Representatives

Representatives of the Class A hospitals throughout the State of California met with the members of the Committee on Public Relations on January 18, 1936, at the Sir Francis Drake Hotel, San Francisco.

The meeting was called to order by Chairman Dukes at 4:15 p. m.

Doctor Dukes greeted the visiting staff members.

Doctor Warnshuis gave an outline of the features of an insurance plan which would meet with the approval of the Department of Public Relations of the California Medical Association. These features are as follows:

1. The patient should have free choice of hospitals.
2. The patient should have free choice of doctors, but he must be a reputable approved physician.
3. Services given the patient should consist only of the ordinary hospital care—not to include services of laboratory technicians, as it has been held that services of pathology and x-ray laboratories should not be a part of the hospital service.

Doctor Warnshuis asked that the various hospitals submit their plans for hospital insurance to their own county society and they in turn will submit the same to the Committee on Public Relations, which will be glad to render any advice or counsel desired.

Doctor Dukes called on Dr. Harold Brunn to outline his views for hospital insurance. Doctor Brunn stated that the hospitals are grouping together to formulate a plan, and all of the hospitals in San Francisco have joined the group, with the exception of the University of California (due to State affiliation) and Mary's Help Hospital, which will probably join at a later date.

The plan set forth by Doctor Brunn was as follows:

The patient is entitled to have any doctor he wishes. The doctor will render a bill to the hospital for laboratory services. The patient will be entitled to any service which the hospital now gives, including services of the x-ray laboratory.

It is Doctor Brunn's contention that the radiologist and roentgenologist would have a better chance of changing the present order of their standing under the hospital insurance plan than they have at present.

Dr. Loren Chandler of San Francisco said the hospital group spoken of by Doctor Brunn is composed of three representatives from each hospital, having an executive committee of six. An agreement of policy between the nonprofit organization and the patient and between each hospital and nonprofit organization has been drawn up. When the final copy has been compiled, it will be submitted to a group having a radiologist representation. This policy will be offered to employed groups only at probably 80 cents per month to each individual. This policy will not include the dependents of the employed group. Hospital services will be given for a limit of twenty-one days in any year. Services to consist of bed, board, general nursing care, ordinary drugs, etc., and the services of a physician who is a member of the hospital staff. The patient will be entitled to select any hospital in the group and must be admitted by his own physician. The facilities of the operating room will be given the attending physician and the facilities of the x-ray room and laboratories to be used by any radiologist that is acceptable to the hospital. This policy will be submitted to the various members of the groups and in its final form to the Council of the California Medical Association.

Dr. E. J. Best, representing the Franklin Hospital, stated that the Franklin Hospital has not yet agreed to join the hospital organization, as the constitution by which the hospital is now operated will not allow such action, but the staff members are entirely in accord with the movement. He stated that the hospital would perhaps join at a later date.

The Sutter Hospital of Sacramento was asked to send a representative to the meeting, but were unable to do so. Doctor Warnshuis read a letter from Doctor Scatena, chief of staff of the Sutter Hospital.

Dr. Haight Mitchell of Alameda said he thought a hospital service plan should be worked out which did not include radiologists, pathologists, roentgenologists, etc., and, although a plan could not be worked out which would be workable in every city, the policies issued should be as uniform as possible.

Dr. Clain Gelston of the Children's Hospital set forth a plan by which the hospital will not give medical services, but will offer to the physician the use of the hospital equipment. The patient to be brought in by his own physician. The x-ray department, including the technicians, will be at the disposal of the physician.

Doctor Cook of Los Angeles spoke of a plan which has been in operation in Los Angeles and which has worked out most satisfactorily. He will send a written copy of the plan.

Dr. Raymond Swinney of Long Beach urged that a working plan for hospital insurance be inaugurated as soon as possible or the medical profession will be forced to accept a plan not satisfactory to them.

Dr. Lowell S. Goin of Los Angeles spoke of the position of the roentgenologist in medicine of today and asked that these men be given consideration in the forming of the hospital insurance plan. He urged that in the forming of the plan the hospitals should not be given the right to practice radiology.

Dr. Alexander Keenan of San Francisco: The hospitals are not practicing medicine; the facilities are there for the use of the physician. The physician should send his own bill to the hospital. The hospital will be paid $6 a day from the central fund. When any special work is done by the technician, the technician will be paid for his services. The x-ray man is now paid by the hospital, but if this arrangement is not satisfactory he can send his bill direct.

William Holley of Los Angeles is entirely in agreement with the hospital insurance plan and believes such a plan should be made to meet the requirements of the middle class of people. Doctor Holley also spoke of the necessity of the medical profession's grouping together.

Dr. T. Henshaw Kelly does not believe the hospital should give any service other than that of bed, board, and general nursing care. The doctors and hospitals should coöperate with each other to make a hospital insurance plan workable. The pathologists and roentgenologists are medical doctors and should be treated as such; they should not be a separate part of the medical profession.

Doctor Dukes stated that, from hearing the various discussions, a working plan could be formulated and asked that the various groups send in their reactions to the questions brought up in this meeting.

Dr. Rodney Yoell spoke of the obligation of a physician to his patient and the responsibility of the doctor for this patient. He said the technical men should work out their own problem in regard to who should and should not practice pathology, roentgenology, etc., and how the bills of these men should be rendered—to the physician in charge or to the patient direct.

Doctor Stone: The radiologists are not trying to change the present plan of practice of medicine, but are working toward the recognition of the profession that x-ray work is specialty work.

Dr. Morton Gibbons: It is suggested that a meeting of the Public Relations Committee with three representatives of hospital and roentgenologists be arranged. This was concurred in, and Doctor Warnshuis will notify the members when the meeting is to be held.

After the adjournment of the meeting of the staff members and the Public Relations Committee, the regular meeting of the Public Relations Committee was called to order by Chairman Dukes.

Doctor Warnshuis outlined a plan whereby the material of the Public Health Institutes will be sent to the San Diego Fair. The California Medical Association has been granted 22,000 feet of space for these exhibits. In addition, the American Medical Association will also have space for exhibits at the fair. If the public health exhibits are sent to the Fair, the Public Health Institutes to be held in various parts of the State will be suspended until after the month of September, 1936. It was moved by Doctor Peers, seconded by Doctor Gibbons, that the exhibits be sent to the San Diego Fair. Carried.

The Federation of Women's Clubs are desirous of putting on an educational program throughout the State on the mental hygiene problem of the child and the adult. They have requested that the Department of Public Relations of the California Medical Association coöperate with them in this work.

It was moved by Doctor Gibbons and seconded by Doctor Dukes that the Department of Public Relations coöperate with the Federation of Women's Clubs in this work. Carried.

Doctor Warnshuis suggested that at the next annual meeting of the California Medical Association to be held in Coronado in May that the Association sponsor an evening public meeting in San Diego.

It was moved by Doctor Gibbons and seconded by Doctor Askey that this meeting be arranged. Carried.

Doctor Warnshuis displayed the placard which has been prepared to hang in the reception room of doctors' offices, entitled "The Physician and His Patient." It was suggested that these placards be sent with certificates to all doctors. It was moved by Doctor Gibbons and seconded by Doctor Peers that these placards be sent to the members. Carried.

The activities of the Public Relations Department were outlined by Doctor Warnshuis. These activities include the sending of press releases to some 250 newspapers every week. Several doctors have been asked to send in articles suitable for press releases. Doctor Warnshuis requested Doctor Askey to secure from Mr. Cochems some of his radio talks to be used as a press release.

Steps should be taken to contact the San Francisco Fair Administration members so that the California Medical Association may acquire directorships of the San Francisco Fair of 1938.

It was moved by Doctor Gibbons and seconded by Doctor Askey that steps be taken by the director to contact the San Francisco Fair Committee. Carried.

It was moved by Doctor Peers and seconded by Doctor Graves that the cost of printed placards for insertion with the monthly statements of public utility companies, etc., be ascertained. Carried.

Upon motion of Doctor Gibbons, seconded by Doctor Askey, Doctor Warnshuis was instructed to make arrangements for a future meeting of the chiefs of staff of the various hospitals throughout the State with the members of the Public Relations Committee. Doctor Warnshuis is to arrange the meeting and the time thereof.

Adjourned 6:45 p. m.

C. A. Dukes, *Chairman*,
F. C. Warnshuis, *Secretary*.

THE WOMEN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. THOMAS J. CLARK..President
MRS. ELMER BELT......Editor and Chairman of Publicity

State Auxiliary News

State Board Meeting.—A meeting of the officers and members of the board of the Woman's Auxiliary to the California Medical Association has been called by the president, Mrs. Thomas J. Clark of Oakland, for Monday, February 10, to be held in Los Angeles. All members of the state board are urged to attend, and all county presidents are most cordially invited to the session. The report of the convention chairman, Mrs. Elliott G. Colby of San Diego, of the preparations and plans for the annual state meeting to be held in Coronado the latter part of May will be of great interest to all Auxiliary members. The capable manner in which Mrs. Colby has handled the preconvention arrangements promises an excellent session. The details of the place and hour of the board meeting will be mailed by the state secretary, Mrs. C. Kelly Canelo of San Jose.

* * *

Fresno County to Have Auxiliary.—The Fresno County Medical Society held its annual meeting on December 3 at the University Sequoia Club, and invited as its guests the members' wives. Mrs. William H. Sargent of Oakland, State Chairman of Membership and Organization, was a guest of honor for the occasion, and in an after-dinner talk told of the need and the value of the medical auxiliaries organized throughout the State and the nation. Mrs. Sargent speaks well and to the point, and easily brought the already evident interest and enthusiasm of the Fresno women to decisive action. When the dinner program was over the women adjourned to a session of their own, and the initial plans of organization were formed. Officers of the new unit will soon be announced. The California Auxiliary gives warm welcome to this new county group, which becomes the seventeenth Auxiliary of the State.

Current Medical Topics Material.—In a recent "National News Letter," Mrs. Rogers N. Herbert of Nashville, Tennesse, National Auxiliary president, gives some of the sources from which materials and information on current medical questions can be obtained. These suggestions may prove helpful for study or programs in the county auxiliaries here. Mrs. Herbert says:

"Pamphlets and handbooks containing scientific information on nearly every subject which your Auxiliary might care to present may be secured at a nominal cost from Dr. W. W. Bauer, director of the Bureau of Public Instruction, American Medical Association, 535 North Dearborn Street, Chicago, Illinois. An especial need is felt at this time for pamphlets prepared by the American Medical Association on current subjects, such as 'New Forms of Medical Practice,' and the 'Handbook of Sickness Insurance, State Medicine, and the Cost of Medical Care.' These pamphlets may be obtained from the secretary of the California Medical Association.

"Special radio talks have been prepared by the American Medical Association for five, ten, and fifteen-minute broadcasts, and may be obtained for local use by writing the Bureau of Public Instruction. If planning local broadcasts, bear in mind the dates of the national American Medical Association radio programs to avoid conflicts. The American Medical Association began its radio broadcasts on October 1, to continue every Tuesday thereafter over the blue network of the National Broadcasting Company at 5 p. m., eastern standard time (2 p. m. Pacific time).

"The general theme, 'Medical Emergencies and How They Are Met,' will be presented in dramatized form with incidental music. Publicize these programs as widely as possible by announcing them in your various club activities and by telling the hour of the programs to all with whom you come in contact."

* * *

Suggestions from the National President.—In carrying on the work of the basic Auxiliary organizations, Mrs. Herbert, the National president, makes the following suggestions: "As we begin the records of the new year, let us continue to emphasize the importance of accuracy. It is vital to the National Auxiliary that each state and county organization keep their records accurate and up to date, with names and addresses in alphabetical order. The National treasurer and Chairman of Finance are working out plans to simplify the present system, and these plans cannot succeed unless based on accurate records of each individual Auxiliary.

"The National Auxiliary is dependent for its functioning power upon the coöperation of the state and county members, and their records may be compared with the wheels within a watch that, no matter how small, contribute to the perfect recording of time if perfect themselves, but throw the whole out of balance if imperfect.

"Records for permanent filing are sent to the historian by National, State, and County Auxiliaries, and from the historian they pass on to the Chairman of Archives.

"As we enter the new year, let us bear in mind the significant part that each Auxiliary member plays in forwarding our great health work, and let us remember that it is only through the closest coöperation and constancy to purpose that we can hope to achieve any measure of success."

* * *

County Auxiliary Reports

Kern County.—The Woman's Auxiliary to the Kern County Medical Society entertained their husbands at dinner on December 21 at the Stockdale Country Club. The tables were beautifully decorated with holly and red candles. This Christmas party is an annual occasion, and the attendance this year numbered over a hundred members and visitors. The guests of honor were: Dr. Robert Peers, president of the California Medical Association; Dr. Edward Pallette, the president-elect; Dr. C. G. Toland, the past president; Dr. Frederick C. Warnshuis, the secretary-treasurer; Dr. Henry J. Ullmann, a councilor of the third district from Santa Barbara; Dr. Charles Evans and Dr. and Mrs. Earl Moody, also of

---

† As county auxiliaries to the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Elmer Belt, chairman of the Publicity and Publications Committee, 2200 Live Oak Drive, Los Angeles. Brief reports of county auxiliary meetings will be welcomed by Mrs. Belt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the editor to allocate two pages in every issue for Woman's Auxiliary notes.

Santa Barbara; Dr. John V. Barrow of Los Angeles and Mrs. Barrow, president of the Los Angeles County Woman's Auxiliary; Dr. A. E. Anderson, Mr. Alfred Siemon, and Mr. and Mrs. Dale Parke of Los Angeles. Some very interesting and instructive talks were made by the distinguished guests, after which the evening was spent in dancing and games.

The committee in charge of the arrangements included: Mesdames Louis Packard, S. C. Compton, P. N. Root, F. J. Gundry, Jack M. Nicholson, and N. N. Brown.

The next meeting of the Auxiliary will be held in February, when the State Auxiliary president, Mrs. Thomas J. Clark of Oakland, will be entertained.

Mrs. N. N. Brown, *President.*

* * *

Los Angeles County.—A Christmas party, together with gifts and a one-act play, featured the December meeting of the Los Angeles County Woman's Auxiliary, held in the Association building on the 17th. Gifts of food, clothing, and toys, brought to the meeting by the members, were later packed into baskets and distributed the day before Christmas to fifty families of the profession, who were incapacitated either by age or illness.

"The Doctor's Christmas Dinner," a play written by Mrs. Mark Albert Glaser, was put on by a spirited cast under the competent direction of Mrs. Charles E. Futch. This comedy represented a familiar scene in every doctor's household—the impatient family gathered about the table for a delayed dinner party. When the doctor does finally appear and a happy occasion is in sight, the inevitable emergency call comes and the doctor, like an old fire-horse keen for the fray, speeds off on his errand of mercy. The members of the cast included: Mesdames William R. Molony, Jr., Walter H. Boyd, Elizabeth G. McKelvey, E. B. Plimpton, A. Brockway, Dr. Silas A. Lewis, and Mr. Frank Tote.

Not included in the script of the play, came a near tragedy when Dr. Silas Lewis, impersonating the head of the house, flourished his carving knife realistically over the beautifully browned turkey, which his audience knew was to be raffled off later and, therefore, to be kept intact. Of this, the doctor's able acting seemed to give no hint, and the contour of the fine bird remained in jeopardy until the phone call rushed the carver from the scene to save a patient. The turkey raffle brought in proceeds of $25, which were used in helping to provision the Christmas baskets.

Mrs. Steele F. Stewart concluded the program with an excellent review of Hans Zinsser's colorful book, "Rats, Lice, and History." As the Lilliputians conquered Gulliver, so has the infinitesimal louse conquered great armies and changed the history of the world by spreading disease and destruction. Only since the life history of this insect has been studied and revealed by scientific workers has man become in part a conqueror, and only by constant and adequate vigilance can he remain in the ascendancy. This book presents a challenge to the world and a triumph for scientific research.

Mrs. Harold E. Crowe, *Corresponding Secretary.*

* * *

Sacramento County.—The regular meeting of the Woman's Auxiliary to the Sacramento Society for Medical Improvement was held at the home of the president, Mrs. Frederick N. Scatena, on Tuesday evening, December 17, 1935. There was no business meeting, as the occasion was planned as a Christmas party. Each member brought a "white elephant" gift, which was placed in a large basket in the entrance hall. Everyone played bridge and visited in the rooms, which were beautifully decorated for the holiday season. The president presented her Executive Board as hostesses for the evening.

The program chairman, Mrs. Harry Kanner, introduced Mrs. Irma Sheean and Mr. Rudolph Caffan, who sang, both as soloists and in duets, accompanied by Mrs. Zue Geery Pease. After the entertainment and cards, Mrs. E. O. Brown acted as Santa Claus and distributed the gifts. Light refreshments followed, served by Mesdames Scatena, Harry Kanner, A. K. Dunlap, William Van Den Berg, F. B. Brendel, T. Binkley, W. A. Reckers, J. T. Vance, E. O. Brown, Russel Harris, E. T. Rulison, Lorenz Ruddy, and George Foster.

Sarah L. Brendel, *Corresponding Secretary.*

* * *

Santa Clara County.—The regular meeting of the Woman's Auxiliary to the Santa Clara County Medical Society was held on January 6 at Saren's in San Jose, with Mrs. Russel Lee presiding. Our guests, Mrs. Thomas J. Clark of Oakland and Mr. Louis Olsen of Palo Alto, spoke before the business session. Mrs. Clark told of the aims of the Auxiliary and of its growth. In her charming way she brought us in closer touch with the State and National Auxiliary organizations and with the work they are doing. Mr. Olsen, public health officer of Palo Alto, spoke on *Epidemiology*. He touched on the history, type and control of epidemic diseases such as plague, cholera, smallpox, typhoid, and typhus.

At the business meeting fifty members answered to the roll call. A paragraph from a letter from the Los Angeles County Woman's Auxiliary regarding the radio broadcasts was read. The program chairman announced that a party to include the husbands is being planned, and the exact date will be set in the near future.

Mrs. Merlin Maynard, *Corresponding Secretary.*

COMPONENT COUNTY MEDICAL SOCIETIES

CLARK COUNTY

The Clark County Medical Society held its monthly meeting on December 9, 1935, at the Sal Sagev Hotel. The following members were in attendance: Doctors Martin, Mildren, Balcom, Garrison, Van Meter, Jannson, Scofield, Slavin, Bryan, Blinstrub, McDaniels, and Woodbury. Guests of the Society were Doctors Schenck, De Smit and McKee, and Mr. Larson, x-ray technician of the Boulder City Hospital.

The Society was extremely fortunate in having for its guest and speaker of the evening, Dr. Ross Moore of Los Angeles. Doctor Moore has interested and acquainted himself with the field having to do with the autonomic system. The speaker, with the aid of charts, discussed the functions and the relationship of that system with the other systems and organs of the body. He was especially enthusiastic concerning research and experimental work under consideration, revealing the interrelationship of the autonomic system and the endocrine glands. It was his feeling that as additional knowledge is uncovered concerning the functions of the autonomic system, so will a much broader and more accurate insight into the field of therapeutics—both medical and surgical—be gained. Already progress has been made in the surgical treatment of those bugaboos of medicine, namely, arthritis and hypertension, through the resection of certain fibers of the autonomic system. The Society is deeply indebted to Doctor Moore for the pleasing and enthusiastic manner in which a rather technical subject was presented.

Following the address by Doctor Moore the Society proceeded with the election of officers. Dr. J. R. McDaniels, Jr., of Boulder City, was elected president; Doctor Scanlon of Searchlight, vice-president; and Doctor Slavin of Las Vegas was reëlected secretary-treasurer. New members elected to the Society included Doctors Schenck and De Smit of the Boulder City Hospital staff, and Doctor Bryan, who transferred from his Society in Mississippi to the local unit.

Hale B. Slavin, *Secretary.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American College of Physicians, Detroit, March 2-6, 1936. Mr. E. R. Loveland, 133 South Thirty-sixth Street, Philadelphia, Executive Secretary.

American Medical Association, Kansas City, Missouri, May 11-15, 1936. Olin West, M. D., 535 North Dearborn Street, Chicago, Illinois, Secretary.

Annual Congress on Medical Education, Medical Licensure and Hospitals, Chicago, February 17-18, 1936. Dr. W. D. Cutter, 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Coronado, May 25-28, 1936. Frederick C. Warnshuis, M. D., 450 Sutter Street, San Francisco, Secretary.

California Tuberculosis Association, Sacramento, April 2-4, 1936. Mr. W. F. Higby, 45 Second Street, San Francisco, Executive Secretary.

Medical Broadcasts*

The American Medical Association broadcasts over WEAF, the red network instead of the blue, as formerly, and certain additional stations of the National Broadcasting Company at 5 p. m., eastern standard time (4 p. m. central standard time, 3 p. m., mountain time, 2 p. m. Pacific time), each Tuesday, presenting a dramatized program with incidental music under the general theme of "Medical Emergencies and How They Are Met." The title of the program is "Your Health." The program is recognizable by a musical salutation through which the voice of the announcer offers a toast: "Ladies and Gentlemen, Your Health!" The theme of the program is repeated each week in the opening announcement, which informs the listener that the same medical knowledge and the same doctors that are mobilized for the meeting of grave medical emergencies are available in every community, day and night, for the promotion of the health of the people. Each program will include a brief talk dealing with the central theme of the individual broadcast.

Pacific Network.—The stations on the Pacific network are KGO KPO KFI KGW KOMO KHQ KFSD KTAR.

* * *

San Francisco County Medical Society.—The radio broadcast program for the San Francisco County Medical Society for the month of February is as follows:

Tuesday, February 4—KYA, 6 p. m.
Tuesday, February 11—KYA, 6 p. m.
Tuesday, February 18—KYA, 6 p. m.
Tuesday, February 25—KYA, 6 p. m.

* * *

Los Angeles County Medical Association.—The radio broadcast program for the Los Angeles County Medical Association for the month of February is as follows:

Saturday, February 1—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, February 1—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, February 4—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, February 8—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, February 8—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, February 11—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, February 15—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, February 15—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, February 18—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, February 22—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, February 22—KFAC, 10:15 a. m. Subject: Your Doctor and You.
Tuesday, February 25—KECA, 11:15 a. m. Subject: The Highway of Life.
Saturday, February 29—KFI, 9 a. m. Subject: The Highway of Life.
Saturday, February 29—KFAC, 10:15 a. m. Subject: Your Doctor and You.

Mental Disease Is Discussed at Meeting of Dental Alumni.—Investigation into the causes of mental sickness involve two schools of research, the physiological and the psychological, according to a paper read by Dr. George S. Johnson, professor of neuropsychiatry in the Stanford University School of Medicine. The physiological school, he said, considers anatomy, neuropathology, chemistry, etc., in an effort to reach the source of the mental symptoms. The psychological school takes little or no account of any possible relationship between the mental processes or symptoms and changes in the brain.

The ancient conceptions that mental diseases were due to weird and mysterious agencies, the gods and devils of superstition, prevailed until comparatively recent times, when psychiatry began its beneficent ministrations, largely as a humanitarian movement. The early leaders in this movement help to establish the belief that those who were insane were sick, and thus cleared the path for intensive inquiry into the real nature and causation of mental disease.

Strange Action of Latent Infections Detailed in Paper.—The strange action of many latent or "symptomless" infections of both animals and humans were detailed at length in a paper prepared by Dr. Karl F. Meyer, director of the Hooper Foundation, University of California Medical School, for presentation to the annual meeting of the Society of American Bacteriologists in New York.

In the paper Doctor Meyer stated that a measles infection under the influence of convalescent serum may be modified to an unrecognizable condition, absence of fever or Koplik's spots, with an indefinite rise in temperature.

"Yet it is well known that these so-called 'mitigated forms' of measles are highly infectious and not infrequently the nodal centers for large epidemics."

The analysis of "silent or resting infection" introduced by surgeons during the war to characterize the delayed appearance of tetanus and gas gangrene infections, was touched on in the paper. According to investigations, spores of the tetanus bacillus may remain at the site of the inoculation in animal experimentation or may be carried to various parts of the body where they persist for long periods.

Certain infections introduced into the human body by traumatic injuries or gunshot wounds, especially shrapnel splinters, may remain within the wound or scar tissue without causing the least reaction. But they are a constant source of danger. An operation for the removal of shot fragments, performed weeks, months or years after the original injury, may lead either to a local or general tetanus or a rapidly fatal gas gangrene infection.

---

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to California and Western Medicine, 450 Sutter Street, San Francisco, for inclusion in this column.

Sunday Pathology and Radiology Conferences at Coronado.—Sunday, May 24, 1936, the day before the California Medical Association annual session, will be devoted to the annual Cancer Commission conferences on radiology and pathology. Programs will be announced in later issues of CALIFORNIA AND WESTERN MEDICINE. Put the date on your calendar now.

Herzstein Lectures for 1936.—The Morris Herzstein course of medical lectures for 1936 will be given by Dr. John Gerald FitzGerald on March 2, 3, and 4. Doctor FitzGerald is professor of hygiene and preventive medicine, director of school of hygiene, director of the Connaught Laboratories, and dean of the faculty of medicine at the University of Toronto.

The titles of the lectures are:

March 2—Precept and Practice of Preventive Medicine.

March 3—The Practice of Preventive Medicine in the Prevention and Control of Diphtheria.

March 4—The Practice of Preventive Medicine in the Prevention of Localized Staphylococcic Infections.

The Morris Herzstein lectures were established in 1929 by the late Dr. Morris Herzstein of San Francisco, to be given under the direction of the medical schools of Stanford University and the University of California.

New Registration Law of California.—Registration laws enacted by the last legislature have made it necessary to postpone the securing of signatures for the Qualifying Certificate (Basic Science) initiative for two years. The following newspaper clipping gives information concerning registration dates:

"The presidential primary election in California on May 5 will have a vital bearing on the national election.

"You cannot vote in the presidential primary in California unless you re-register by March 26.

"The deadline is nearing.

"No matter when you registered previously, unless you have re-registered since January 1, you must register again."

National Health Council.—Health protection for the public of the United States is disposed of with the expenditure of only 50 cents annually per person in tax money, compared with the annual average expenditure of $4.52 per person for police protection and $3.32 per person for fire protection.

This is but one item in a pamphlet, "Health Facts," just off the press, published by the National Health Council, 50 West Fiftieth Street, New York City, as part of the material for the Health Today and Tomorrow campaign, recently launched and planned for the winter and spring months: . . .

We are graduating as many persons from the community into nervous and mental hospitals as we are sending out into the community each year from our colleges and universities. More than 50 per cent of all hospital cases in this country are those of some form of mental illness. The present annual average of mental cases recovered or improved is about 40 per cent.

Another statement: Relief funds make little appreciable addition to health services for the needy. Social Security Act appropriations, when they become available for public health work, will not be large enough to make up for the depression shrinkage in regular health department appropriations since 1929. . . .

Forty-eight per cent of the nurses available for community services are paid from private funds. On the other hand, the public health nursing service is the largest single item among public health expenditures—about one-third to one-half of the tax funds for public health goes to pay for public health nurses. Yet the total number of nurses now serving the country, however, amounts to only one-third of the number needed in communities. Public health nursing organizations have suffered a 10 per cent reduction in income, while the volume of free service has had to be increased.

Los Angeles County Medical Association: Membership Statistics. — The January "Bulletin" included the following interesting membership figures of the Los Angeles County Medical Association in the annual reports:

Membership in 1919	749
Membership in 1920	898
Membership in 1921	1,036
Membership in 1922	1,235
Membership in 1923	1,317
Membership in 1924	1,453
Membership in 1925	1,549
Membership in 1926	1,590
Membership in 1927	1,674
Membership in 1928	1,726
Membership in 1929	1,851
Membership in 1930	1,904
Membership in 1931	2,013
Membership in 1932	2,009
Membership in 1933	2,077
Membership in 1934	2,143
Membership in 1935	2,260

Reduced Mortality from Pneumonia.—Reduced mortality from pneumonia may be expected if plans of the Medical Society of the State of New York are successful.

A statement issued by Dr. Thomas F. Farmer of Syracuse, chairman of the Public Health and Medical Education Committee of the Society, states:

"Pneumonia kills about 12,000 persons in New York State every year. A considerable proportion of these persons suffer from types of the disease for which serum is available. The early use of serum in these cases will save many lives."

The development of the work is in direct charge of Dr. Russell L. Cecil of New York City, chairman of the pneumonia subcommittee. According to Doctor Cecil, the public should know that almost every case of pneumonia starts with a cold accompanied by fever. Early diagnosis is imperative for effective medical care.

Says Doctor Cecil in a statement issued by the medical society: "While serum is not available for all types of pneumonia, it is for some of the most prevalent forms. We hope to bring to the attention of the public the vital need for skilled nursing care. Generally, members of the household will not do. In no other disease does nursing care count for more in the battle the patient is making for his life. Nursing organizations are planning to extend nursing care for pneumonia patients. Too much must not be expected of the serum; it is a great help, it is true, but it will not supplant adequate medical and nursing care."

World Given Method to End Dentistry Pain.—The International News Service dispatch which follows promptly made for itself a place in the lay press and radio broadcasts:

> New York, Jan. 22.—The dread of a dentist's drill was eliminated today when painless dentistry became a reality.
>
> A secret formula of "anti-pain liquid" was disclosed by the discoverer, Dr. Leroy L. Hartman of Columbia University at a joint meeting of two New York district dental societies.
>
> Doctor Hartman refused $250,000 for the formula, preferring to donate it "to humanity."
>
> The discovery, climaxing twenty years of personal research, will enable dentists to make a tooth insensitive to pain during treatment, at a cost of less than one-half cent.
>
> The application is simple. A pellet of cotton moistened with the solution is applied to the tooth. Drills may then be applied without pain to patients.
>
> "This is my humble contribution to humanity, and I hope it will be the means of relieving much unnecessary pain," said the silver-haired discoverer.
>
> Chemical firms today started preparation of the solution, which can be supplied in twenty-four hours.
>
> The formula, by weight, follows:
>
> Thymol, one and a quarter parts.
>
> Ethyl alcohol, one part.
>
> Sulphuric ether, two parts.
>
> Dentists ranked the discovery with the demonstration of anesthesia in surgery in 1846.
>
> Doctor Hartman spent eighteen years in research work before he found the formula.
>
> Doctor Hartman said it had been tested in five hundred cases and proved thoroughly successful. A half-ounce bottle, costing less than $1, suffices for two hundred applications.

Los Angeles "Chinese Doctor" of Fifty Years Ago. The Los Angeles *Herald-Express* prints, daily, excerpts from its paper of fifty years ago. The issue of January 28, 1886, contained the following:

"Los Angeles has the novel sight, to many, of a Chinese doctor who drives in style to visit numerous white patients and administer his doses of whisky-soaked lizards. He goes dressed in the finest silks, drives a fine horse, sits in a costly buggy and is 'allee samee Melican doctor,' only he makes more money."

Radium Victim Gets French Honor Legion Cross.—International News Service prints:

"Paris, January 25.—Dr. Eugene Beaujard, famous French electroradiologist and victim of his own experiments with radium, has now lost his right hand and in return has been awarded the Cross of the Legion of Honor.

"Minister of Public Health Ernest Lafont went to Doctor Beaujard's bedside in Diaconesses Hospital here immediately after the operation and informed him that, in recognition of his sacrifices to science, the president of the republic had awarded him a decoration.

"The 62-year-old radiologist has already resumed work at the Bichat Hospital."

Mary's Help Hospital.—Dr. A. S. Musante, president of staff, has sent the following letter:

"*To the Editor:*—Relative to the resignation of Dr. Alfred C. Reed, mentioned in the January issue of your publication, I have been requested to advise you that Doctor Reed's resignation was accepted with a vote of thanks for his efficient work as head of the medical department of Mary's Help Hospital for the last eight years."

Hospital Council of Southern California: Bulletin on Special Nurses' Fees.—The Hospital Council of Southern California, over the signature of R. E. Heerman, secretary, 1414 South Hope Street, sent out in January the following announcement:

> At the regular monthly meeting of your Executive Committee on January 9, 1936, the matter of increasing the special duty nursing rate from a basic $5 for eight hours to $6 for eight hours, as now being discussed by the California Nurses' Association, District 5, was brought to the attention of the members of the committee, and after a complete discussion of the matter they instructed me to issue this communication to you advising you of the following action:
>
> It was recommended that we petition the nurses' organization to consider the matter of increased rates and discuss the situation with a committee from the Hospital Council. The committee members expressed themselves as being in sympathy with plans to increase compensation to special duty nurses, but did not feel that this was the opportune time, for the following reasons:
>
> First: The public are still having difficulty in paying the full cost of hospitalization and always considers the special nurse's bill as part of the hospital bill.
>
> Second: Most hospitals are still running deficits, and until the public are able to pay the full cost of hospitalization so that adequate increase in wages can be given to general duty nurses they do not feel that preference should be given to those doing special duty.
>
> Third: Many doctors are protesting such increase, as it will prevent hospitalizing patients and, if hospitalized, will force such cases to be taken care of on general duty, thus increasing the cost to the hospital.
>
> Fourth: Unless we can get the sympathetic understanding of the public, together with the doctors and hospitals, such increase in special nursing rates would tend to decrease hospitalization and calls for special nurses and throw an additional financial burden on hospitals, and at the same time decrease the possibility of doctors collecting any part of their fees.
>
> This bulletin is issued in the spirit of coöperation, feeling that the best interests of the medical profession, hospitals, and nurses can be served by an understanding of these common problems and that hospitals should act as groups instead of individual units.

Ophthalmology Examinations.—The American Board of Ophthalmology announces that examinations for 1936 will be held in Kansas City, Missouri, on May 11, at the time of the meeting of the American Medical Association, and in New York City in October at the time of the meeting of the American Academy.

All applications for case reports must be filed at least sixty days before the date of examination.

Information, syllabuses, and application forms may be obtained from Dr. Thomas D. Allen, assistant secretary, 122 South Michigan Avenue, Chicago, Illinois.

Next Five Years to Be Made Safer Years in Auto Traffic.—Vehicide is to be made increasingly unpopular during the next *lustrum*, if plans of the National Safety Council eventuate successfully, for that organization has just announced a five-year, country-wide campaign to reduce motor-vehicle deaths at least 35 per cent by the end of 1940, looking toward the saving of at least 38,000 lives during the period. The drive started January 1, 1936.

It will be continued with growing intensity and momentum during the five-year period. It will be localized for each state and for virtually every city, where closest coöperation will be maintained with public officials, traffic safety leaders, safety groups, leaders in education, civic organizations, and interested individuals. It is planned to coördinate much of the existing safety effort, to centralize and standardize the work through application of tested methods proved by successful experience. Close coöperation with federal groups is assured.

The campaign, chiefly educational, will include a broad program of engineering and enforcement activities. The Council realizes that spasmodic safety drives have not yielded the desired permanent results. The serious nature of the problem demands a much broader program than has been attempted. Success will be sought by developing new ways of appealing to the individual motorist, to arouse a sense of responsibility and of good sportsmanship. A definite state-wide school program will be recommended for each state, together with the organization of state safety councils and localized organizations in municipalities.

Adoption of uniform laws, including standard drivers' license legislation, will be urged, with adequate administration of traffic laws, including state highway patrols. Standardization of accident reports also will be undertaken, as well as provision for more complete accident statistics, with their interpretation and application. Detailed engineering, enforcement and educational technique of the states and cities now doing outstanding work will be made available to the country at large, as one of the initial steps in the program.

The formal resolution, adopted unanimously by the Executive Committee at its November meeting, "pledges the Council's whole-hearted assistance and the active efforts of thousands of its members in all parts of the country, and invites the coöperation of all interested organizations and agencies to the end that during this five-year program at least 38,000 lives shall be saved and the killing and maiming of little children and all our people shall cease upon our highways."

The time is especially propitious. The 1935 toll of death and injury promises to approximate the tragic experience of 1934, when 36,000 persons were killed and a million and a quarter injured—of whom 150,000 will be crippled for the rest of their lives. The resolution declares that this situation "presents the most serious challenge to all who believe in a well-ordered society and the sanctity of human life."

Certain states and cities, through fine programs, have demonstrated through recent years that such an achievement is possible. Their experience shows that motor-vehicle tragedies can be not only controlled but actually reduced. Striking examples are the work of state-wide organizations in Minnesota, Massachusetts, and elsewhere. Twenty-three states have reported fewer deaths for the first nine months of 1935 than for the corresponding period of 1934; with Massachusetts reporting 14 per cent and Minnesota 11 per cent reduction. Many cities and villages, through intelligent effort, have realized big reductions this year to date.

The Council has a huge functioning organization ready to proceed with increased vigor under the impetus of this larger and more intensive program. The fourth year of the National Traffic Safety Contest, now under way, shows that thirty-three states and more than eight hundred cities have entered into this worthwhile rivalry. The new and enlarged program should cause most of them to redouble their efforts.

LETTERS

Concerning an imaginary law demanding shock-proof x-ray rooms.

California Medical Association

January 31, 1936.

To the Editor:—A few days ago I received a communication from Doctor Yocum, secretary of the San Luis Obispo County Medical Society stating that an x-ray salesman inferred to him that the last legislature passed a law which requires the owners and operators of every x-ray machine to make them shock-proof, and in the event that they don't they would be subject to a fine or legal penalty. I had not heard of any such legislation and, consequently, I asked Mr. Peart to review the bills that were passed at the last legislature.

I enclose copy of reply received from Mr. Peart.

I think this is an item of sufficient importance to merit editorial comment, and suggest that you make such comment in order that our members be not imposed upon by manufacturers of electrical equipment.

Yours very sincerely,
F. C. Warnshuis, *Secretary.*

* * *

January 28, 1936.

F. W. Yocum, M. D.,
Secretary, San Luis Obispo County Medical Society,
San Luis Obispo, California.

Dear Doctor Yocum:

Doctor Warnshuis has referred to me your letter to him, dated January 23, 1936, in which you state that you are informed that there is a California law of recent enactment which will in the near future compel every user of x-ray equipment to have it completely shock-proofed.

A careful review of the laws passed at the last legislature does not show that such a bill was passed. There was one bill passed referring to x-rays which, however, I think would not refer to equipment. This bill did not become a law.

Inquiry here among some of the high-class x-ray distributors discloses that some salesmen are trying to high-pressure doctors with statements of the character made to you.

Trusting this gives you the information desired, I am
Very truly yours,
Hartley F. Peart.

Concerning the official Journal of the California Medical Association.*

New Bedford, Massachusetts,
January 25, 1936.

Dear Doctor Warnshuis:

Two days ago I received the January issue of California and Western Medicine and have read, from cover to cover, every line. It is a splendid publication in every sense, and an example of what a state or regional journal should be. If I could afford it I would subscribe for and read it along with the journals of Pennsylvania, Texas, and Indiana. The last was most interesting in the days of Bulson's editorship. I believe that concentrating on these, with the inclusive reports of discussions of papers in the many district societies, would be more informing than hours of study of accepted standard textbooks. The medical matter is not subordinated to advertising, but prevails mightily throughout, is novel and most satisfying.

I noted the reprinting of the report of the Michigan delegates of the Atlantic City meeting of the American Medical Association on the press story of the "spanking." As I wrote you some time ago, I do believe that was a press gadget. I know nothing of the whole matter, as I heard no preliminary talk with or without malice of shifts in officers. As to Carl Moll, no one regretted more than I that he was not chosen as trustee. . . .

That we, of Massachusetts, should have been classed as "stand pat" Republicans added some mirth to our reading, as I am a Democrat, states rights variety at present seemingly rare, but I take it as a compliment. Mongan, "bewhiskered and good-natured" as he is, is our president and the one well-informed member on health insurance, and at present in the issues a bulwark of strength. . . .

With all kind regards,
Sincerely,
(Signed) Edmond F. Cody.

Illinois State Medical Society
30 North Michigan Avenue
Chicago, Illinois

January 27, 1936.

Dear Doctor Warnshuis:

Your communication of the 22nd received. I personally approve of it heartily and wonder why such a measure has not been introduced before.

I am sending it to our secretary, and it will come up at the March meeting of the Council. . . .

With best regards, I am
Cordially yours,
(Signed) Charles B. Reed,
President.

Concerning expert medical testimony: A recent legal encounter.

On page 74 comment is made concerning a recent demand by certain attorneys to force a physician to give expert medical testimony without receiving a compensating fee. The subpoena served on the physician is printed below, followed by the opinion of the General Counsel of the California Medical Association, that code enactments by the last legislature have made no change in the established law, in so far as privileged and expert medical testimony are concerned.

SUBPOENA SERVED UPON THE PHYSICIAN

In the Superior Court of the State of California in and for the County of Los Angeles
No. 395035

Subpoena Duces Tecum to Appear Before a Notary Public

J. Edward Keating, Plaintiff, vs. The Pacific Mutual Life Insurance Company of California, a Corporation, Defendant.

The People of the State of California send greetings to John Ruddock.

We command you, that all and singular business and excuses laid aside, you attend and appear before C. R. Lilhestrom, a notary public in and for the County of Los Angeles, State of California, at the office of Mills, Hunter & Dunn, 1222 Chapman Building, 756 South Broadway, in the City of Los Angeles, County of Los Angeles, State of California, on Saturday, the fourteenth day of December, 1935, at 9 o'clock a. m. of said day, then and there to testify in this cause now pending in the above-named Superior Court, on the part of the plaintiff, and for failure to attend you will be deemed guilty of contempt of court and liable to pay all losses and damages sustained thereby to the parties aggrieved, and forfeit One Hundred Dollars in addition thereto.

And you are further commanded to bring with you and there produce the following-named books, documents and other things, to wit:

Records of the taking of an electrocardiograph of J. Edward Keating in June, 1935.

Notes made on the taking and reading of said electrocardiograph.

Electrocardiograph report dated June 19, 1935, or true copy thereof, made to the defendant or to Dr. Arthur E. Mark.

---

* See also Council Minutes (items 16 and 31, pages 123 and 124.

By order of the above-entitled Superior Court, this thirteenth day of December, 1935.

Attest: My hand and seal of said court, the day and year last above written.

(Seal) L. E. Lampton, *County Clerk.*
By K. E. Lynch, *Deputy.*

* * *

OPINION OF COUNSEL PEART

December 27, 1935.

To the Secretary:—Answering your recent letter regarding amendment to the statute thought to impose an obligation upon physicians to give expert testimony without compensation. As I wrote you, the statutes have not yet been printed by the State printer, so we have to examine them painstakingly by advance sheets and without the aid of an index.

We find that the amendment in question is to Section 2021 of the Code of Civil Procedure providing for the taking of depositions of witnesses. Paragraph 1 of this Section now reads as follows, the words in italics have been added by the amendment of 1935:

"1. When the witness is a party to the action or proceeding or an officer, member, *agent, or employee* of a corporation, *or the agent or employee of a municipal corporation,* which *corporation or municipal corporation* is a party to the action or proceeding, *or an agent or employee of an individual who is a party to the action or proceeding,* or a person for whose immediate benefit the action or proceeding is prosecuted or defended."

This amendment does not affect a physician as an expert witness in any manner. It merely provides for the taking of the deposition of an agent or employee.

In the case of *Webb* v. *Lewald Coal Company,* the Supreme Court held that a physician who made a confidential report on a patient's condition, without treatment, could not be compelled to testify in regard to the patient's physical condition. This decision may be construed as determining that the relation of agency exists as between patient and physician.

You read me portions of the subpoena served on Dr. Ruddock, which, in our opinion, merely requires Dr. Ruddock to appear at a time and place specified and to give his deposition as to facts, and to produce the records specified.

The opposing attorney will doubtless very properly raise the question as to whether or not Dr. Ruddock is an agent or employee within the meaning of this Section. Before the amendment was adopted, Dr. Ruddock could be subpoenaed to attend the *trial* of this case and produce his records. Under the amendment, he may be subpoenaed to *give his deposition before the trial,* and that is all that the amendment does. This is based on the assumption that it will be held that Dr. Ruddock is an agent or an employee of some party to the action.

In our opinion, Dr. Ruddock can no more be compelled to give expert or opinion evidence without compensation at the taking of his deposition than he could be at the trial of the action.

The question of privilege also arises, and the patient's attorney, unless the privilege is waived, will doubtless object, if the testimony sought to be elicited from Dr. Ruddock is, in fact, privileged.

I trust that this will clarify the matter. I, of course, do not know the facts, or Dr. Ruddock's relation to the case, or who is calling him, whether his own patient or the opposing side; I do not have a copy of Dr. Ruddock's letter, mentioned by Dr. Kress.

As to opinion evidence, the amendment does not change the law at all. We wrote an extensive brief on this subject as *amicus curiae* in the above-mentioned case of *Webb v. Lewald Coal Company* (214 Cal. 182), copy of which is in your files. The Supreme Court did not pass on the question of compensation of a physician called as an expert. It holds that a physician may properly act for a patient without having thereby prescribed for or treated him, and the testimony of the physician may be privileged under subdivision 4 of Section 1881 of the Code of Civil Procedure, if he merely acts for the patient, even though the patient is deemed, when he brings an action for damages for personal injuries, to have consented to permit "any physician who has prescribed for or treated" him for such injuries to testify; and in such action, where patient had a neurologist examine her and make a report to aid her counsel in preparing for trial, but he did not "prescribe for or treat" her, his testimony was privileged.

I am endeavoring to locate a copy of this brief, and if I find it I will mail a copy to Dr. Ruddock.

I am sending copies of this letter to Dr. Ruddock and Dr. Kress.

Very truly yours,
Hartley F. Peart.

Concerning "vaccines" against anterior poliomyelitis.*

State of California
Department of Public Health
Sacramento

December 19, 1935.

Dr. George Parrish,
Health Officer,
Los Angeles, California.

My dear Doctor Parrish:—We have just received a report from the Surgeon-General, United States Public Health Service, regarding poliomyelitis following vaccination against this disease. This article, prepared by Dr. J. P. Leake, Medical Director, United States Public Health Service, will appear in the *Journal of the American Medical Association* of December 28.

Inasmuch as three of the cases listed in his report occurred in California, I am recommending that the use of vaccination against poliomyelitis be discontinued in this state.

Very truly yours,
W. M. Dickie, M.D.
Director of Public Health.

* * *

City and County of San Francisco
Department of Public Health

December 28, 1935.

To the Editor:—Doctor Geiger has instructed me to forward you the enclosed copy of Executive Order No. 119 that you may be informed of the attitude of the Director of Public Health on the use of immunizing agents against acute anterior poliomyelitis.

On authority from the Director of Public Health.

Sincerely,
Jacques P. Gray, M. D.,
Assistant Director of Public Health.

* * *

Executive Order Number 119

On the basis of the public announcement in the medical literature and in the press of the accumulated evidence against the use of so-called "vaccines" to protect the human against acute anterior poliomyelitis ("infantile paralysis"), by Medical Director J. P. Leake of the United States Public Health Service, and others, thereby confirming the recommendations made to the Director of Public Health by his Committee on Acute Anterior Poliomyelitis in the session of April 4, 1935, the use of such "vaccines" or other similar "immunizing" agents is prohibited within the city and county of San Francisco.

This action is believed indicated and appropriate as a public health measure directed at the control of a communicable disease, particularly because the evidence referred to supports the premise that acute anterior poliomyelitis occurs with a greater frequency in those "immunized" than in those not "immunized" in comparable population age groups under comparable conditions.

December 27, 1935.

Concerning privileged information: To whom may it be given:

State of California
Legal Department

San Francisco,
January 15, 1936.

W. M. Dickie, M. D.,
Director of Public Health,
312 State Building,
San Francisco, California.

Dear Sir:—In your communication of the 8th instant you state that you are frequently called upon to furnish information contained in morbidity reports of cases of in-

---

*Article by Dr. J. P. Leake, reprinted from the *Journal of the American Medical Association,* December 28, 1935, appears on page 141.

fectious diseases. These reports, it appears, are submitted to your department pursuant to Section 297a of the Political Code and Section 16 of the Public Health Act, respectively.

You further state that you have for consideration two such requests at the present time, one being from the State Compensation Fund. The latter request is for the records of purported tuberculosis patients who are applying for compensation in "silicosis" proceedings. You ask whether such a state agency is entitled to these records of your department when such are needed for the performance of its duties.

In reply permit me to state that neither the State Compensation Fund nor any private agency is entitled to any information concerning individually named persons which is furnished to you under sections of the laws above referred to.

Section 2979 of the Political Code provides that the State Board of Public Health may publish statistics relative to numbers of cases of communicable diseases, and such further comparative statistics and information as may be deemed of value to scientists, the medical profession, the general public, and of aid in the maintenance of good health conditions. The Section is permissible only, subject to the limitations above noted, and contains no language which would indicate that the Board has authority to supply to anyone information concerning individuals.

Section 16 of the Public Health Act (Statutes 1907, p. 893, as amended) requires certain named persons, among them being physicians, to report the illness of any person of any infectious, contagious or communicable disease. It is required that this information be reported to the county, city and county, city, or other local health board or health officer, together with the name of the person, if known, and the place where such person is confined, and the nature of the disease, if known.

Section 11 of the Public Health Act requires county health officers, etc., to report in writing to the State Board of Health at certain specified times, information they have secured concerning infectious, contagious, and communicable diseases coming to the formers' knowledge. Section 13 subjects local health officers to the rules, regulations, and orders of the State Board of Health, or its secretary, and it is my understanding that reports concerning the diseases enumerated in such section are made pursuant to either regulations or orders of the State Board of Health, or its secretary, respectively, and under Section 2979a, which is the statutory counterpart of Section 16 of the Public Health Act.

A careful reading of the sections referred to fails to intimate that it is the duty of any health officer to supply information to members of any private or State agency. In fact, Section 2979a distinctly provides that official records of tuberculosis cases shall be for official use only and not open to public inspection. The latter portion of this section permits the State Board of Health, or its secretary, to take necessary measures to prevent the spread of such contagion, but this power is more commensurate with the right to quarantine than it is with the right to disclose information secured by either the State Board of Health or the Department of Public Health.

Reports furnished to you are not public records unless so declared by statute or unless, at least, a statute authorizes the publication of the matter therein contained. Section 2979 of the Political Code contemplates the publication of statistics only, and it has already been adjudicated in this State that not every record is public because of the fact it is filed with a public agency. (*Colnon* v. *Orr,* 71 Cal. 43.)

You are, therefore, advised that you are not required to furnish information contained in morbidity reports concerning individuals to any state or private agency, even though such reports relate to disease other than tuberculosis.

You also refer to the request of private agencies for names of persons afflicted with certain infectious diseases. These agencies, you point out, desire to solicit from such persons blood to be used in a serum for scientific purposes.

What has been hereinbefore stated is applicable to this situation as well. While it may well be that the furnishing of the names and addresses of these persons would be an advantage in the preparation of serums for use in the treatment of other diseases, the legislature has made no provision for the supplying of this information.

While Section 1881 of the Code of Civil Procedure does not deal with the subject of reports required by law to be made to the State Board of Public Health, it does state, "There are particular relations in which it is the policy of the law to encourage confidence and to preserve it inviolate"; and thereafter prohibits, except in certain stated instances, a licensed physician or surgeon from testifying in a civil action except with the consent of his patient. All such sections together would seem to indicate the intention of the legislature was to permit reports concerning individuals to be made to the State Board of Public Health for possible action by the Board or its secretary with respect to an individual case. Certainly the sections cannot be said to contemplate that any company or state agency might indirectly secure through the Board information which a physician is prohibited from disclosing except with the consent of his patient.

This does not mean that you could not advise private or public agencies the names of physicians handling certain types of cases (as for example, poliomyelitis), but it would seem to be incumbent upon such physicians to secure the consent of a patient before they could disclose to such agencies the patient's name. There would, likewise, seem to be power in the Board in proper instances to ascertain from the physician in attendance whether it might directly contact the patient to learn if the patient objected to giving blood for a serum either to the State or any public or private agency.

Very truly yours,

U. S. Webb, *Attorney-General.*
By Lionel Browne, *Deputy.*

Concerning proposed public health work under the Social Security Act.

State of California
Department of Public Health
Sacramento

January 16, 1936.

To the Members, State Board of Public Health:

Gentlemen:—Under the Social Security Act, if and when Congress appropriates the amount which has been recommended by the Administration, California's allotment for rural health and sanitation will be in the neighborhood of $200,000. These funds will be allocated by the United States Public Health Service.

The president of the Board, the director, and the regional consultant to the United States Public Health Service have had numerous conferences in reference to a program for the expenditure of these funds in the State of California. The carrying out of the program will place a great deal of additional work and supervision on this department. We feel that a bureau of county health supervision should be established, and a physician as chief of the bureau be selected who has had experience in the promotion of county health work, and who will act as administrative officer for the supervision of this work. It will be necessary to provide such personnel as secretary to the chief, stenographer, accountant, and supervising nurse.

It has been suggested by the United States Public Health Service that the Board consider the establishment of a bureau of industrial hygiene.

It has also been suggested that funds be set aside to pay for the inspection and control of psittacosis.

We have received a request from the United States Public Health Service that we take over the employment of eighteen rodent-control men, who have been with the Service for many years, and that their salaries be paid out of Social Security funds, which would amount to something like $20,000 a year. This, with the activities outlined above in connection with the State Department of Public Health, would total about $50,000 annually.

The remainder of the funds that are allocated are to be used for strengthening of existing whole-time health departments in the way of adding additional sanitary inspectors and public-health nurses; organizing an additional four or five whole-time health departments in those counties which do not have such an organization, but have sufficient population to justify same. This would care for the major portion of the population of the State in some twenty-odd counties, leaving thirty-eight rural counties with small populations (from 250) to be divided into districts according to geographical lines. Each of these districts would have a whole-time health officer, sanitary inspectors, and public-health nurses living in the various community centers, who will act as representatives of the district health officer. There would also be a traveling unit, consisting of some of our present and additional personnel, to take care of emergencies that might arise.

This program probably could not be carried out during the first few years, but should be the ultimate goal, so that the whole State may have adequate public health service.

In addition to the foregoing, it is proposed that a school of public health be established on the Coast, to which the health officers of the western states will have the privilege of sending personnel to receive education in their particular field. This will be financed by other funds which will be expended in each state by the health officer for scholarships and maintenance expense of the candidates.

Very truly yours,

W. M. Dickie, M. D.,
Director of Public Health.

Concerning anesthesia administration in California.

State of California
Legal Department

San Francisco,
January 14, 1936.

James P. Dobyns, Managing Editor,
Hospital Management,
612 North Michigan Avenue,
Chicago, Illinois.

Dear Sir:—I have your communication of the 3rd instant in which you ask certain questions concerning anesthesia administration in California.

In reply please be advised that this office has heretofore interpreted the Medical Practice Act of this State to include anesthesia administration as part of the practice of medicine, and as such to be carried on only by medically licensed practitioners.

We have also expressed the view that it is sufficient that a doctor of medicine be in charge of the administration of anesthetics though the administration of anesthetics be by an assistant, provided the responsibility for the giving of the anesthetics is that of the licensed person, that the person actually administering the anesthetic do so as the assistant or "extra hands" of the licensed person, and that the assistant follow instructions of the licensed person and not exercise independent judgment in the diagnosis, treatment or condition of the patient. We have also expressed the view that a lay anesthesiologist may not charge the patient directly for the giving of the anesthetic, as well as that such charge could not be made by a hospital. A charge for the giving of an anesthetic would, in most instances, result in the corporate practice of medicine. In other words, we have stated that the giving of an anesthetic as well as the right to charge for the same is personal to the licensed practitioner.

Opinions of this office heretofore rendered indicate that there is no restriction upon who may assist in the administration of anesthetics as long as the administration is by or under the direction of a licensed practitioner.

Very truly yours,

U. S. Webb, *Attorney-General.*
By Lionel Browne, *Deputy.*

Concerning "California and Western Medicine" comments on federal survey of chronic diseases.

Treasury Department
United States Public Health Service

January 23, 1936.

To the Editor:—I want to take this opportunity of thanking you for the wonderful support California and Western Medicine has given to the U. S. Public Health Service survey of chronic diseases and physical impairments. I assure you that we realize the value of this means of advising the medical profession of the intent and purposes of the survey.

Mr. Sharp, regional publicity director, has advised me that both Washington, D. C., and Detroit offices of the survey are anxious to have copies of the magazine and the extensive article you so kindly published. The Government requests such things, but fails to furnish a means of remuneration, and I am wondering if you publish sufficient copies, to contribute two additional ones to this office in order that we may comply with the requests.

Again assuring you of our appreciation for the support given, I remain

Very truly yours,

Dr. Arthur Hieronymus,
State Supervisor.

208 Builders Exchange Building,
Hobart and Webster Streets, Oakland.

(Note.—Copies were sent.)

Concerning donation to Barlow Medical Library.

December 20, 1935.

Dear Doctor Warnshuis:

The check received from the California Medical Association for $129.50 as an additional gift to the library is much appreciated, and the organization desires me to express thanks for this additional gift.

The gift of the California Medical Association has enabled us to add many books to the library that would not have been possible otherwise, and, we trust, has enabled us to be of greater use to the members of the State Association as well as our own county members.

Yours, with many good wishes.

Mrs. Mary E. Irish, *Librarian.*

Concerning donation to Lane Library.

Stanford University
Office of the President

December 20, 1935.

My dear Doctor Warnshuis:

May I through you thank the members of the California Medical Association on behalf of the University for the recent check for $129.50 to be credited to the Lane Library Book Fund.

With much appreciation and all good wishes, I am,

Faithfully yours,

Ray Lyman Wilbur, *President.*

* * *

Lane Medical Library
Sacramento Street at Webster
San Francisco, California

December 19, 1935.

My dear Doctor Warnshuis:

I was so pleased to receive your check of $129.50. The generous gifts from the California Medical Association have been such a help during this period of curtailed income, and I assure you that we are most appreciative of the assistance. Please accept the thanks of the library staff, and our cordial holiday greetings.

Very truly yours,

Louise Ophuls, *Medical Librarian.*

Concerning charts illustrative of California taxation.

California State Chamber of Commerce
San Francisco,
January 17, 1936.

Members, California Medical Association:

In an effort to bring home to all of the people of the State the alarming condition resulting from the growing cost of government, the State Chamber of Commerce is issuing a series of simple charts, such as the attached, which are attracting widespread attention.

This is part of a campaign for general public education, and the story told by each of these charts cannot be too strongly stressed. We want to ask the coöperation of your publication in reprinting as many of these charts as you can.

We feel that everyone, no matter how specialized his interests, should be made to realize the meaning of the tax situation as revealed by these charts, each of which is based upon up-to-date and accurate information.

Very truly yours,
W. H. Sloane, *General Manager.*

SPECIAL ARTICLES

POLIOMYELITIS FOLLOWING VACCINATION AGAINST THIS DISEASE†

By J. P. LEAKE, M.D.*

During the past year in the United States, several thousand individuals, mostly children, have received subcutaneous and intracutaneous injections of treated poliomyelitis virus in the hope of acquiring immunity against the natural disease. The two different forms of treatment to which the virus was subjected were intended to render it innocuous when thus used as a vaccine. Through those responsible for the production of these vaccines, through several health officers and through others, word has come to the United States Public Health Service of the development, at suggestive intervals following these injections, of cases of paralytic poliomyelitis with high fatality. Though possibly subject to some correction, it is believed that the following statements represent closely the facts in each case:

1. A boy, aged five years, had his first symptoms of poliomyelitis six days after receiving the second dose of vaccine A in the left arm, the first dose having been given in the same arm twenty-seven days before the second. Paralysis began in the left arm the day after onset, and death occurred after an illness of three days.

2. A girl, aged twenty-one months, received the second dose of vaccine A in the right arm twelve days after the first dose, and the onset of poliomyelitis occurred six days after the second dose. Paralysis began in the right arm three days later, and death occurred five days after the onset.

3. A boy, aged four years, had his onset of poliomyelitis eight days after the first dose of vaccine A in the left buttock, and one day after the second dose at the same site. Paralysis began in his right leg two days later and is at present, after three months, confined to that extremity, though there is hope of ultimate nearly complete recovery.

4. A girl, aged eight years, had her onset of poliomyelitis eight days after the first dose of vaccine A in the left arm, and one day after the second dose in the same arm. Paralysis began in the arm two days later, and death occurred after an illness of three days.

5. A boy, aged eight years, had his onset of poliomyelitis eight days after the first and only dose of vaccine A in the left arm. Paralysis began in the right arm two days later, and remained as a deltoid paralysis at last accounts.

6. A boy, aged five years, had his onset of poliomyelitis nine days after the first and two days after the second dose of vaccine A in the arm. Arm paralysis began two days later, and death occurred after an illness of three days.

7. A boy, aged ten years, had his onset of poliomyelitis ten days after the first dose of vaccine A in the left arm and three days after the second dose in the same arm. Paralysis began in the right arm the next day, and death occurred after an illness of three days.

8. A girl, aged five years, had her onset of poliomyelitis eleven days after the first dose of vaccine A in the right arm, and four days after the second dose in the left arm. Paralysis began in the left arm four days later and was still present at last accounts.

9. A boy, aged fifteen months, had his onset of poliomyelitis thirteen days after a dose of vaccine B, and developed general weakness four days later, which persisted at the last report.

10. A boy, aged five months, had his onset of poliomyelitis fourteen days after a dose of vaccine B, and paralysis was first noticed nine days later. This paralysis persists at the last report.

11. A girl, aged six years, had her onset of poliomyelitis fourteen days after the first, and seven days after the second, dose of vaccine A in the arm. Paralysis began in the left arm three days later, and complete recovery was questionable at the last report.

12. A youth, aged twenty years, had his onset of poliomyelitis fourteen days after the first and only dose of vaccine B in the arm. Paralysis began in the arm two days later, and death occurred after an illness of four days. From this case poliomyelitis was transmitted to monkeys by Doctor Kessel.

Paralytic poliomyelitis was not epidemic in any of the localities at the time of the occurrence of these cases if these cases themselves are not included in the count. During the heaviest incidence of poliomyelitis in the community with the highest reported incidence, the expectation of paralytic poliomyelitis among those vaccinated within three weeks following vaccination, judging by its occurrence by age groups in the community at large, was less than one-tenth of a case, yet a case occurred. At the other periods and in the other localities cited, the chance of a case occurring among the vaccinated was much less, yet in each instance cases occurred. The likelihood of the whole series of cases having occurred through natural causes is extremely small. In none of the cases was exposure to infection outside its own area known to be of special significance.

---

† See California letters in this issue, page 137.

* Medical Director, United States Public Health Service, Washington, D. C.

It is believed that to many physicians this series of cases, following by intervals of from six to fourteen days the injection of one or the other of two different vaccines, renders undesirable the further use of poliomyelitis virus for human vaccination at present.

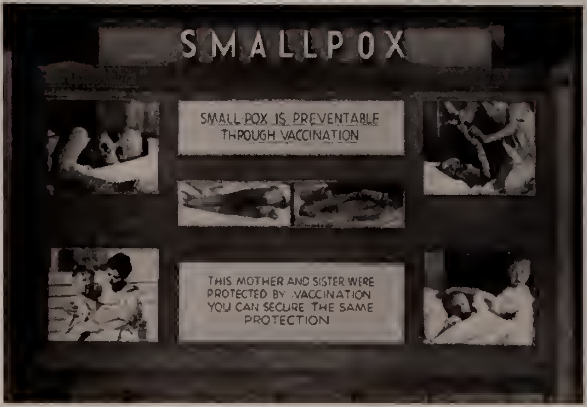
In every case in which the sequence is known, the level of the spinal cord first affected corresponded to the extremity in which the injection was made, paralysis beginning either in the same limb or in the contralateral limb. This is strong support to other evidence that the virus of poliomyelitis is transmitted along nerve fibers, since neither blood nor lymph streams would afford direct access from one extremity to the corresponding cord level. The remarkably high fatality in this series of cases was perhaps due to the part of the cord primarily infected being close to the nuclei corresponding to the muscles of respiration. The possibility is to be considered that a strain of poliomyelitis that has been subjected to prolonged monkey passage, with rather short incubation periods, is unusually virulent to man when administered by the subcutaneous or intracutaneous route. Though in a few of these cases it is possible or even probable that there was another intercurrent illness in addition to poliomyelitis, in general the preparalytic symptoms were such as would be expected in poliomyelitis naturally acquired.

In forming a judgment as to the applicability of a poliomyelitis vaccine, the not inconsiderable local and general reactions following its use need to be taken into account.[1] It is also noteworthy that the appearance of neutralizing antibodies in the blood after the injection of poliomyelitis virus is very uncertain evidence of parallel immunity to the natural disease.[2]

Although any one of these cases may have been entirely unconnected with the vaccine, the implication of the series as a whole is clear.—*Journal of the American Medical Association.* December 28, 1935.

C. M. A. HEALTH INSTITUTES

Members, by these pictures, will be able to visualize the nature and extent of the Public Health Institutes that are sponsored by our Association. Their purpose being the education of the public in matters pertaining to public health and medical care for the purpose of building sound public opinion in regard to public and private health.



SMALLPOX
SMALL-POX IS PREVENTABLE THROUGH VACCINATION
THIS MOTHER AND SISTER WERE PROTECTED BY VACCINATION YOU CAN SECURE THE SAME PROTECTION

Smallpox Exhibit

It is contemplated to conduct a series of these institutes throughout the State through county societies and auxiliaries. Details outlining the preliminary work to conduct an institute have been mailed to every county secretary. Further details may be obtained from the State Director of Public Relations.

"How to Live with Your Heart"

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. LX, No. 2, February, 1911

From Some Editorial Notes:

The Present Legislature.—At the time of writing, no bills harmfully modifying our Medical Practice Act or seriously menacing public health have been introduced, though, if one may judge at all by the history of past legislatures, some bills of this class will be introduced ere long. . . .

* * *

Public Health.—The President, Mr. Taft, in his message to the Congress, makes the following statement in regard to public health legislation: "In my message of last year I recommended the creation of a Bureau of Health, in which should be embraced all those government agencies outside of the War and Navy departments which are now directed toward the preservation of public health or exercise functions germane to that subject. I renew this recommendation." That should silence a good deal of adverse talk; but it will not. . . .

* * *

Progress in Thoracic Surgery.—Differential pressure is still the all-absorbing problem of thoracic surgery. If this question is satisfactorily solved and a small, convenient, ever-ready apparatus evolved, the technique of surgery of the thoracic cavity will make rapid strides. . . .

* * *

Advertising Once More.—Why, do you suppose, any manufacturer pays this Society good money for space in your *Journal* in order to set forth the merits of his goods? Do you think it is just a way he has of getting rid of his superfluous money, or do you regard him as a peripatetic philanthropist? He is not. He has something that you may need, that it may be to your advantage to know about and that he hopes he may sell to you. It is distinctly to your advantage to read the advertising pages of your *Journal* and to see what things are there offered to you; it is a little difficult, in this world, at least, to know too much and you might as well know all you can—especially when it does not cost you any more. Everything advertised in this *Journal* is honest and exactly as represented. . . .

* * *

Curious Delusions.—It is singular how people who wish to sell things to eat or drink seem to have the delusion that the particular thing they wish to sell has most wonderful therapeutic value! Foodstuffs of the most simple composition become wonderful remedies in the expert hands of the advertisement writer; even water can become a cure-all. . . .

* * *

Medical Charity.—The vexing problem of the abuse of medical charity, or the "dispensary evil" has grown lustily for a generation. It became so bad in New York that in 1898 the Dispensary Law was passed and all dispensaries required to be licensed by the State Board of Charities. This has only partly corrected the evil. . . .

* * *

Marvelous Bacteriology.—During the past few years attempts have been made to bring about a closer relationship between the medical and pharmaceutical professions, with a fair measure of success, and it is not at all uncommon to see pharmacists and expert chemists contributing to our various medical journals. The dental

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

News

"Theft of a medical calling kit and its contents, valued at $135, from an automobile owned by Dr. Merrill Hollingsworth of Santa Ana, was reported to the Santa Ana police yesterday. Included in the loot taken was some morphin and hypodermic needles." (Orange *News*, December 30, 1935.) Similar circumstances have been mentioned in previous news items, showing how sneak thieves are always watching an opportunity to rob a doctor's car.

"The Shasta County Board of Supervisors is debating the adoption of a resolution requiring the presence of a physician at every birth in the Shasta County Hospital. Such a requirement was recommended by the 1935 Shasta County grand jury in the final report filed yesterday. District Attorney Glenn D. Newton was instructed yesterday by the Board to investigate the legality of such a requirement." (Sacramento *Bee*, January 10, 1936.)

"Police Judge E. J. Tyrrell of Oakland yesterday continued the arraignment of Dr. J. Douglas Thompson, chiropractor and 'radio doctor' on a charge of falsely advertising a 'diagnostic fluid,' until Saturday morning, after Joe Brown, San Francisco attorney, notified the court that he had been retained by Thompson and would not be able to appear. Doctor Thompson, who is at liberty on $500 cash bail, was not in court. The chiropractor, who maintains offices at 330 Fifteenth Street, surrendered Wednesday on a warrant sworn to by C. B. Heiser, Pure Food and Drug Inspector for the State Department of Public Health, on charges that Doctor Thompson sold bottles of a preparation known as 'Dubla,' accompanied by pamphlets claiming that the fluid could be used by purchasers to detect acidity of the blood, as well as the presence of pleurisy, hay fever, bronchitis, asthma, and tuberculosis in their early stages. Conviction on the charge carries a maximum sentence of a $500 fine or six months in jail, or both." (San Francisco *Chronicle* (East Bay Edition), January 10, 1936.)

"Police Judge Oliver Youngs of Berkeley yesterday set January 16 for the preliminary examination of Dr. Samuel Twain, Berkeley physician and owner of a clinic at University Avenue and Grant Street, who pleaded not guilty to two counts of violating the State Narcotic Act. Doctor Twain appeared before Judge Youngs to answer charges brought by the State Narcotic Division of keeping no records of his prescriptions and of falsifying records to provide morphin in the name of his dead father-in-law." (San Francisco *Chronicle* (East Bay Edition), January 9, 1936.)

"Dr. John Colbert, an American resident in Tientsin, China, was arrested today by American authorities on a charge of attempting to poison his wife, Rueter's News Agency reported tonight from Tientsin. . . . After the preliminary hearing, Doctor Colbert was said to have been freed in the high bail of $25,000." (Press dispatch dated London, December 25, 1935, and printed in the San Francisco *Examiner*, December 26, 1935.) The records of the Board of Medical Examiners show Dr. John Colbert, a graduate of St. Louis University in 1903, was licensed in California in 1914.

---

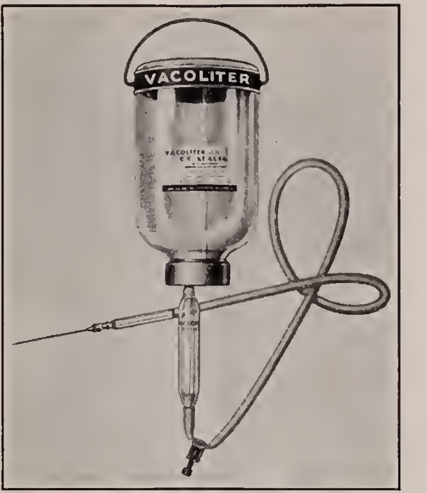
† The office addresses of the California State Board of Medical Examiners are printed in the roster on advertising page 6.

(Continued in Front Advertising Section, Page 18)

ACACIA INTRAVENOUSLY

FOR THE TREATMENT OF ACUTE HEMORRHAGE OR SHOCK

• Intravenous acacia was introduced for the treatment of acute hemorrhage and shock during the World War. At the close of hostilities, some seventy-five liters per day of the six per cent solution in normal saline were being dispatched for use in field hospitals, from the British Base Hygiene Laboratory in Boulogne alone. After the Armistice, a conference of military surgeons at Boulogne agreed that no harmful effects were to be apprehended from the use of properly prepared acacia solution.



• During the post-war period, however, several reports appeared which attributed anaphylactic, hemolytic, and agglutinating properties to acacia. Despite continued publication of successful results, the opinion grew that administration of acacia was unsafe, and its use was widely discouraged.

• Experimental evidence of the past decade proves that previous unfavorable results were invariably due to improper preparation of the solution or to faulty technique. Particularly convincing are the published reports covering *more than three thousand injections of acacia,* with uniformly excellent results. The use of intravenous acacia has become so firmly established in some institutions, as to make its administration a matter of regular operating-room technique.

• The physiological effects following infusion of acacia into a patient suffering from shock or hemorrhage include improved respiratory function, sustained elevation of blood pressure, decreased coagulation time, and slightly increased blood viscosity. The patient's response is often almost "theatrical", and the improved condition is maintained while the normal fluid regulating mechanism resumes its functions.

• As a blood substitute, acacia adequately satisfies the demands for not only definite therapeutic value, but also for *instant availability, compatibility with all blood groups, freedom from harmful reactions, simplicity of administration, and economy.* As contrasted with the transitory effects of non-colloidal blood substitutes, such as salt or dextrose solutions, the effects of colloidal acacia infusion are maintained for six to eight hours instead of one or two. Furthermore, acacia not only remains within the circulatory system, but tends to attract fluid from the tissues into the circulation—a valuable property in shock. Acacia slowly disappears from the blood and is excreted in the urine, complete elimination requiring several weeks.

• Acacia solution in the Vacoliter is administered as readily and simply as a dextrose solution. The Vacoliter soft metal seal is removed, the sterile tube and needle assembly connected, and administration started within the space of a few minutes. The dose is determined by the blood pressure and general condition of the patient, and usually amounts to 500-1000 cc. of 6% acacia in salt or dextrose solution, administered at the rate of 500-750 cc. per hour.

• The literature on intravenous acacia stresses the necessity for proper preparation of the solution. Baxter's Acacia is carefully prepared with the established Vacoliter technique and sterilized in the sealed Vacoliter. Before release to the profession, each lot must satisify the exacting requirements of the chemical, bacteriological, and biological tests applied to every Vacoliter solution — your final assurance of complete safety for your patients. For a condensed, informational review of the literature on acacia solution, send for the booklet, "ACACIA INTRAVENOUSLY".

6% Acacia in Physiological Sodium Chloride Solution, Plain or with 5%, 10%, or 20% Dextrose, is available in 1000 cc. and 500 cc. Vacoliters. Twenty-six other solutions are offered in the Vacoliter, including Dextrose, Sodium Chloride, Ringer's, and Hartmann's.

Limited Facilities for Part-Pay Treatment

Corporate Practice of Dentistry Illegal in Illinois.—The Dr. Allison, Dentist, Inc., the plaintiff in this action, entered into a contract with the defendant dentist wherein the latter agreed, according to the record, "that he would not practice operative dentistry for a period of three years at any place within two miles of the corporate location." Shortly thereafter the dentist opened a dental office directly across the street from the corporate dental parlors and the corporation sought to enjoin the violation of the agreement. The trial court, in denying the injunction, held that the plaintiff corporation was illegally practicing dentistry, that the corporation's only damage would arise out of competition in a line of business which it could not lawfully follow, and that therefore the petition of the corporation for an injunction did not appeal to the conscience of a court of equity. The corporation appealed to the Supreme Court of Illinois, contending that Section 18a of the Dental Practice Act, which prohibits corporations from practicing dentistry, was unconstitutional.

The Supreme Court, however, considered it to be unnecessary to pass on the constitutional question. The gist of the corporation's complaint, and its claim to equitable relief, was based on damages alleged to be feared through the defendant's competition in practicing dentistry. The practice of a profession, said the court, is everywhere held to be subjest to licensing and regulation under the police power and not subject to commercialization or exploitation. To practice a profession requires something more than the financial ability to hire competent persons to do the actual work. It can be done only by a duly qualified human being, and something more than mere knowledge or skill is essential to qualify. The qualifications include personal characteristics, such as honesty, guided by an upright conscience and a sense of loyalty to clients or patients, even to the extent of sacrificing pecuniary profit, if necessary. These requirements are spoken of generically as that good moral character which is a prerequisite to the licensing of any professional man. No corporation can qualify. It can have neither honesty nor conscience, and its loyalty must, in the very nature of its being, be yielded to its managing officers, its directors, and its stockholders. Its employees must owe their first allegiance to their corporate employer and cannot give the patient anything better than a secondary or divided loyalty.

The corporation, in its complaint, stated that the dentist had acquired secrets and confidential information in regard to the patrons of the corporation. It might be well inquired, said the court, in whom are these personal secrets imposed when a corporation attempts to practice? Can it be in the president alone, or is he under the corporate duty of disclosing them to his directors? And are the directors under the further corporate duty of disclosing them to stockholders? This very allegation of the corporation clearly demonstrates, the court said, the inappropriateness of any corporate attempt to practice one of the learned professions, involving personal and confidential relations, and most clearly demonstrates that such practice is not and cannot be open to commercial exploitation. The corporate charter of the corporation, the court said, did not and could not authorize it to practice dentistry, and the trial court quite properly dismissed the complaint. (*Dr. Allison, Dentist, Inc.,* v. *Allison* (Ill.), 196 N. E. 799.)—*Medico-Legal News Item.*

Malpractice: Facial Paralysis Following Mastoidectomy.—The physician-defendant, a specialist in diseases of the ear, nose and throat, punctured the plaintiff's ear drum, from which pus was immediately discharged. After observing the patient for four days, he made a diagnosis of mastoiditis and performed a mastoidectomy. The operation resulted in "a degree of facial paralysis." Another physician, who performed a second operation to alleviate the paralysis, found that the facial nerve had been injured. This operation improved the facial paralysis, but return of function was not complete. The plaintiff then sued the physician-defendant. From a judgment against him, the physician-defendant appealed to the Supreme Court of Washington.

The physician-defendant contended that he was not negligent in performing the operation, but that during

MAPHARSEN

A REFINEMENT OF THE ARSENICAL THERAPY OF SYPHILIS

Parke, Davis & Company introduces to the medical profession a new antisyphilitic arsenical, the result of co-operative research conducted by two university groups and the Research Staff of Parke, Davis & Company.

Mapharsen is the hydrochloride of meta-amino-para-hydroxy-phenylarsine oxide. Extensive clinical data demonstrate that it is an efficient antisyphilitic agent. Reactions following its administration have on the whole been less severe than those observed after the injection of other commonly used arsenicals.

The Parke-Davis Research Laboratories have subjected Mapharsen to rigid chemical and pharmacological testing, including tests for trypanocidal and spirocheticidal potency. A review of this work, together with a complete discussion of the clinical evaluation of Mapharsen and its use in the treatment of syphilis, has been included in our new booklet; a copy will be sent to any physician on request.

Mapharsen has been accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

Not Advertised to Laity

the operation the facial nerve was exposed, as the result of necrosis of the protecting bone, and somehow subjected to injury. Such necrosis, he said, could set in within four days after the onset of infection. The plaintiff argued that infection had not existed for a sufficient time to cause such necrosis and that if the operation had been performed skillfully the facial nerve would not have been injured. The physician who performed the second operation testified that two weeks to a month in an average case of mastoiditis, and never less than eight days, was required for an infection in the middle ear to spread into the mastoid and produce the necrosis in question. The plaintiff testified that the physician-defendant told her that he had made a mistake and had cut the nerve, saying nothing at the time about any necrosis or crumbling of the bone. The physician-defendant denied having made this statement and testified, "I told her that during the operation I had accidentally uncovered the facial nerve, and that I did the best I could under the circumstances I had to deal with, and that was what had happened. . . ." There was sufficient evidence, said the Supreme Court, to justify the jury in finding that the time between the detection of infection and the operation was insufficient for such necrosis to have set in. It was not contended that the physician-defendant adopted an erroneous method of operating or that the operation which he performed was not proper and necessary. The contention was that the operation was performed in a negligent manner. The distinction between the two classes of cases involving negligence on the part of physicians is pointed out in *Swanson* v. *Hood,* 99 Wash. 506, 170 P. 135, wherein it was said:

> But there is an obvious distinction between a claim of negligence in the choice of methods of treatment and a charge of negligence in the actual performance of the work or treatment after such choice is made. As to the first, the charge is refuted as a matter of law by showing that a respectable minority of expert physicians approved of the method selected, thus taking the case from the jury. As to the second, a charge of negligent performance, where there is any evidence tending to show such negligence, the case is for the jury, as in other cases of negligence, whenever upon the evidence the minds of reasonable men might differ. . . .

The record in the present case, said the Supreme Court, contains substantial evidence to support the jury's finding that the operation was negligently performed. There was no testimony to the effect that in operations similar to the one here involved the facial nerve is frequently injured. The evidence went no further than to indicate that such injuries occasionally occur. The plaintiff was not required to prove negligence by direct and positive evidence; it was only necessary that a chain of circumstances be established from which negligence was reasonably and naturally inferable. The jury had a right to take into consideration the fact that a second operation was necessary in order to correct the condition resulting from the first operation.

The Supreme Court could find no reversible error and, therefore, affirmed the judgment of the trial court for the plaintiff. (*Marlowe* v. *Patrick* (Wash.), 44 P. (2d) 776.) *Medico-Legal News Item.*

We wish to know what is going on; what the progress of science is; what leaders of the nations are doing; how our civilization is faring; and whether our community is what it should be. Though the matters to be dealt with are multifarious, one thing comforts us: only a people rich in culture has a wealth of problems. Nations that have slipped backward have been governed too little by what they knew or might have known, too much by indifference or superstition. Great changes swept over them before they realized what was happening. We wish to be alive to our country's needs and play a part in meeting them. We aspire to be free, realizing that freedom in our world of dense population is no longer a by-product of vacant lands, but a cultural achievement.—Leon J. Richardson.

The Birth Control Controversy.—At present there is a controversy on the subject of birth control. On the whole the medical profession is in favor of birth control under certain circumstances, while it is opposed by certain ecclesiastics, on religious or moral grounds, and is entirely condemned by the Roman Church. At the Hunterian Society a debate was opened by the bishop of St. Albans, who entirely opposed birth control by artificial means. He had a strong intuitive sense that the whole thing was wrong and degrading, and in all esthetic and moral judgments the intuitive sense was not to be disregarded. Birth control was a deliberate frustration of the biologic ends of nature. Self-control he exalted as the thing which differentiated man from the animal.

Dr. C. P. Blacker, secretary of the Eugenics Society, said that the central question was whether it was possible for the married to regulate an appropriate number of births by the method of abstinence. He had been impressed lately by a number of books from Catholic sources advocating the so-called safe period. It was clear that Catholic physicians and priests were finding difficulties with their patients and penitents in this regard.

Sir Walter Langdon Brown, emeritus professor of physics in the University of Cambridge, said that the world was overshadowed by war, the aggressor being a country trying to find room for its teeming population, and yet in the criminal code of the same country birth control was ranked side by side with banditry. Birth control was directed to life and health, so that a woman would be able to space her family at the proper intervals and give each member a chance of being properly brought up. He believed that celibacy was possible to many and that marriage was the crown of human happiness, but that married celibacy was the worst thing possible. He preferred birth control as an alternative to those things which in the old days were regarded as of divine ordinance—war, pestilence, and famine.

In the general discussion a young physician said that if physicians did not believe in birth control because it was an interference with nature, logically they ought not to try to prevent or postpone death, for this also was an interference with nature.—*London News Letter.*

Sterile Marriages.—In view of the attitude of the present German Government in promoting an increase of the population, the question of sterile marriages is fraught with interest. Professor Eymer, ordinarius in gynecology at the University of Munich, who discussed this subject before the Munich Medical Society, stressed most emphatically that any attempt to discover the cause in a given case presupposes a careful examination of both partners even though the wife should present pronounced abnormalities.

Causes of marital sterility traceable to the wife may be based on anomalies of any of the many portions of the genital canal. In addition, there are general, and even psychic, causes of sterility. Of less importance are inflammations of the vulva, tumor formations of the labia majora and the labia minora, and a rigid hymen. Vaginism as a psychic reflex requires mental treatment. There is no doubt that retroflexion of the uterus may cause sterility. Considerable importance attaches to the observation that after long-continued use of inserts and anti-conceptional lavages, and also after induced abortion, sterility often intervenes. Nonpatency of the fallopian tube is an important factor from a purely numerical point of view. In bilateral closure of the tubes the prospects of successful treatment are very poor. Roentgen stimulative treatment is absolutely rejected by reason of the undesired effects often observed and because of possible injury to the germinal plasma. Sterility associated with disturbances of other endosecretory glands is always traceable to ovarian dysfunction accompanying these glandular disturbances. Of especial importance in this connection are the hypophyseal disorders. It is the opinion of Professor Eymer that occasionally the causes of sterility lie in the general mode of living or in the misuse of medicines and luxury articles (tobacco).—*Berlin News Letter.*

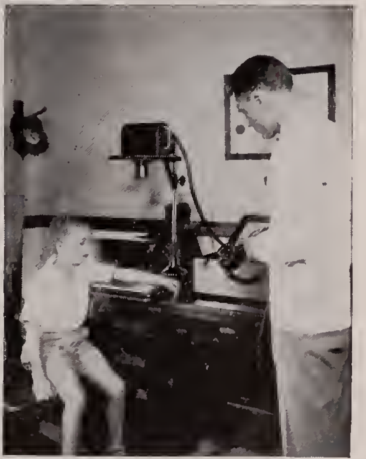
DON'T JUDGE THE RANGE OF THIS OFFICE-PORTABLE X-RAY UNIT BY ITS SIZE

BECAUSE the G-E Model "F" Office-Portable X-Ray Unit seems to you so extremely small in size, and its low price places it easily within your means, don't make the mistake of overlooking its practical diagnostic range and ability to produce radiographs of fine quality.

The principle of *complete* oil-immersion of both the high-voltage transformer and the x-ray tube in a single, sealed container accounts for this unusual compactness and high efficiency. Moreover, it makes the outfit absolutely shock proof under all operating conditions.

If you have not yet taken the opportunity to see a practical working demonstration of the Model "F" in your own office, you cannot fully appreciate its possible advantages in your practice.

Fill out and mail this coupon requesting a demonstration. You need not feel obligated in so doing.



In the office or in the patient's home, this unit is practical, convenient and efficient.

☐ Please arrange for an office demonstration of Model "F" Office-Portable X-Ray Unit.

☐ Send literature describing the Model "F" Unit. A52

Road Accidents and Lighting.—To what extent motor accidents are due to poor road lighting is not easily ascertained, but statistics suggesting that it is the cause of many injuries were given in an address by Mr. E. C. Lennox, vice-president of the Association of Public Lighting Engineers, at the Public Works, Roads and Transport Congress, held in London. The density of traffic on the roads, he said, was not only steadily increasing, but steadily increasing during the hours of darkness. Heavy goods traffic was being carried to an ever greater extent on the roads at night, and this, with the enormous development of omnibus service, has contributed to make us "an eighteen-hour nation." Statistics showed that the accident hazard at night was several times greater than by day. He estimated that if the main roads were efficiently lighted, making the use of motor headlights unnecessary, accidents would be reduced by 10 per cent and the increased cost would be counterbalanced by the reduced cost of what the community paid for accidents through insurance companies alone. More than 46 per cent of accidents occurred during the winter months, although traffic was then less heavy than in the summer. In the winter 52 per cent of accidents occurred during the dark hours and in summer more than 20 per cent, when there was least traffic. In a whole year one-third of the accidents happened during the dark hours. During the two hours of the session of the congress, on the average two persons would be killed and sixty-two injured. If the session had been between the hours of 5 and 7 in the evening, in the dark when traffic would be less, the figures would have been 4.3 killed and 132 injured. These figures could easily be reduced by better public lighting.

In the discussion that followed, it was stated that experience at Lewisham (South London) showed that better lighting led to greater speed of motorists and that it was a question how far improved lighting tended toward safety. A county surveyor said that the present system of lighting was detrimental to good driving, because lights placed up in the air, particularly on a gradient, had a dazzling effect on drivers. It might be possible to floodlight the highways in such a way that the light itself would not be visible.—*London News Letter.*

Estimation of Bacterial Content of Mouth.—With the aim of separating the clumps of bacteria, due to mucin and epithelial cells in the saliva and to the thread forms which entangle masses of bacteria, Crowley and Rickert employed a method similar to that used by Breed and Brew (1933) for making direct bacterial counts of milk, with the exception that an atomizer was used to break up the larger masses and a very dilute sodium hydroxid solution was used as a diluent to dissolve the mucin. They found that the difference in counts made by this method is 13 per cent. The number of bacteria in sprayed washings increased appreciably (at least 36 per cent) over the unsprayed material. Four hundred normal sodium hydroxid treated washings gave a better distribution of bacteria in a smear without, however, materially increasing the count. Counts taken at different times of the day and on different days varied greatly in the same individual. No correlation was noted between counts made by the method described and the "diurnal tide" of Feirer and Leonard.—*Journal of Bacteriology.*

Loss of Weight During Muscular Work.—Hovland recorded the loss of weight during relaxation and during the performance of finger oscillation following the ingestion of large and small meals. Ten subjects were used four days each. Efficiency, judged by the increment of loss of weight during work as compared with the loss during relaxation, appears better after a light lunch, the advantage being greatest in the earlier part of the afternoon, immediately after eating. Maximal inefficiency, from the standpoint of the expenditure of energy, is found in the late afternoon, about four hours after eating.—*American Journal of Physiology.*

●

CANNED FOODS AND THE PUBLIC HEALTH

I. The "Ptomaines"

● Many requests received for further information on canned foods have inquired as to some of the public health aspects of this class of foods. We appreciate the frank interest of our readers in this subject about which so much misinformation exists. We are glad, therefore, to devote this discussion, as well as subsequent ones, to the most popular of the lay misconceptions concerning the wholesomeness of commercially canned foods.

Some laymen hold the belief that canned foods, in some mysterious manner, develop "deadly ptomaines" within the can and hence the consumer of such foods stands in danger of "ptomaine poisoning". In the light of modern knowledge, this belief is ludicrous; it probably had its origin in the old "ptomaine theory" of food poisoning, now so thoroughly discredited by modern medical authorities (1).

Between the years 1870 and 1880, a large number of substances were obtained from protein material which had undergone bacterial putrefaction. These substances were aptly called "ptomaines", from the Greek "ptoma" or "dead body". Toxicologists of the day ascribed marked toxic properties to the new found ptomaines, chiefly by injection studies rather than by feeding tests. The science of bacteriology was then in its infancy—the true causes of food infection or intoxications were not known. Consequently, the discovery of ptomaines, with their alleged toxic properties, permitted the convenient diagnosis of "ptomaine poisoning" for all illnesses following the ingestion of foods. Today, we know that such illnesses usually result from the ingestion of food which had been infected by certain bacterial groups, and not from protein degeneration products such as ptomaines (2, 3).

One authority has stated that "ptomaine poisoning is a good term to forget" (4).

To this we might add that it would also be well to discard the old, unfounded belief that foods in the tin can develop substances hazardous to health.

Canned foods are merely selected foods which, after proper preparation, are sealed in hermetic tin containers and given a heat process calculated to destroy pathogenic and spoilage organisms which might be present on the raw foodstuff. The hermetic seal prevents future infection of the food by such organisms and insures its preservation and wholesomeness.

Such are the simple facts. The cooperation of the medical profession is earnestly solicited in combating the ludicrous, yet widespread, lay prejudice against commercially canned foods.

Economic Difficulties of Hospital Physicians.—More than two thousand physicians give free medical care to the public in the hospitals of Buenos Aires, to which they go daily. As there are no restrictions as to the selection of patients, grave conditions, both for hospitals and for physicians, have originated. The number of patients attending free hospital clinics and dispensaries continually increases, but the hospital incomes do not increase and the means are insufficient to cope with the demands of the public. Some persons, either because they bring letters of recommendation or because they give small donations to the hospitals, are given preferential attention over the poor. The physicians' private practice decreases while their free work in the hospitals increases. Many physicians cannot now make a living, and for this reason the group of hospital physicians agreed to ask a small salary from the hospitals. The Partido Socialista presented a project in which a yearly allowance of 5,000,000 Argentine pesos (about $1,400,000) can be obtained from the Government. The attitude assumed by the physicians has gained publicity through the press and by lectures. The opinions of the physicians are conflicting and, while some believe that it is fair to obtain remuneration for their work, others prefer to have a complete readjustment in the present conditions of the profession, without accepting salaries, a fact that they believe may make the members of the profession subordinate employees in the category of proletarians or place them under the direction of political authorities.—*Buenos Aires News Letter.*

The Eradication of Rabies from England.—Rabies was eradicated from England about forty years ago by an order for the compulsory muzzling of dogs for a period. This prevented communication of the disease by any dog that happened to be in the incubation stage. The effect has been maintained by the quarantine of all imported dogs for a time which exceeds the incubation period. Though rabies is prevalent on the continent of Europe, these measures have kept England free from it, with one limited exception. In 1918 an outbreak occurred in Devon and Cornwall owing to an infected dog having been smuggled into the country. It took three years to weed out this outbreak. Since 1921 there has been no confirmed case of rabies among the dogs of this country, though since 1919 twelve cases have occurred in imported dogs while undergoing quarantine. The vigilance that is exercised with regard to the importation of dogs is shown by the recent case of a woman traveling from Berlin and landing at Croydon airport carrying a very small dog known as a German pinscher. The dog was placed in quarantine, but she was fined $10 because she had not obeyed the regulation which requires any person bringing a dog to obtain a landing license. The maximum penalty for the offense is $250, and she was let off with the much smaller fine because the magistrate was satisfied that she did not break the law deliberately. She knew that the dog would have to be quarantined and thought that this was all that was necessary.—*London News Letter.*

Emesis in Infants Due to Air Swallowing.—Lereboullet and his associates studied the vomitings that occur in infants from swallowing air. Roentgenologic examination has allowed several obscure points to be elucidated. The physiologic action of the pharynx in allowing much more air to be swallowed with liquids than with solids or semi-solids is the principal factor. The mode in which air acts is apparently by creating the intragastric pressure necessary to provoke gastric contraction. The rapidity of the distention plays an important part in producing this condition, which is thus shown to be physiologic rather than pathologic. Three measures of treatment are given. The process may be avoided by direct introduction, by means of a tube, of the liquid food into the stomach, thus avoiding the function of the pharynx. Increase in the consistency of the food does much to decrease the amount of air swallowed. Finally, taking the left lateral decubitus position immediately after eating favors the pyloric evacuation of the intragastric air and decreases the gastric distention.—*Presse Médicale.*

FOOD-DRINK ADDS AVAILABLE IRON TO THE DIET!

●

ALSO RICHLY PROVIDES CALCIUM, PHOSPHORUS AND VITAMIN D

COCOMALT, the delicious chocolate flavor food-drink, is a rich source of available Iron. An ounce of Cocomalt (which is the amount used to make one cup or glass) supplies 5 milligrams of Iron in easily assimilated form.

Thus three cups or glasses of Cocomalt a day supply 15 milligrams — which is the amount of Iron recognized as the normal daily requirement.

Used as a delicious food-drink, Cocomalt provides a simple, palatable means of furnishing Iron to growing children, convalescents, expectant and nursing mothers.

. . . and for bones and teeth

In addition to Iron, Cocomalt is rich in Vitamin D — containing at least 81 U.S.P. units per ounce. Cocomalt is fortified with Vitamin D under license granted by the Wisconsin Alumni Research Foundation.

Cocomalt also has a rich Calcium and Phosphorus content. Each cup or glass of this tempting food-drink provides .32 gram of Calcium and .28 gram of Phosphorus. Thus Cocomalt supplies in good biological ratio three food essentials required for proper growth and development of bones and teeth: Calcium, Phosphorus and Vitamin D.

Easily digested—quickly assimilated

Not the least of Cocomalt's many virtues as a food-drink is its *palatability*. It is so refreshing, so delicious, it appeals even to the very sick. And though it provides exceptionally high nutritional fortification, it is easily digested, quickly assimilated, imposes no digestive strain.

Recommended by you and taken regularly, Cocomalt will no doubt prove of great value to many of your patients.

FREE TO DOCTORS

We will be glad to send a professional sample of Cocomalt to any doctor requesting it. Simply mail this coupon with your name and address.

STANDARD FOR BLOODPRESSURE

W. A. BAUM CO. Inc. NEW YORK
SINCE 1916 ORIGINATORS AND MAKERS OF BLOODPRESSURE APPARATUS EXCLUSIVELY

The Shock Syndrome. — Moon attempts to correlate the contradictory phases of the shock syndrome, pointing out that it results whenever the volume of blood inadequately fills the vascular system. This may result from loss of blood or fluid, or from atony or dilatation of the vascular walls, especially the capillaries and venules. Combinations of these two factors are the rule. Circulatory failure of this type results, not from cardiac or vasomotor inefficiency, but from an inadequate return of venous blood from systemic areas. Increased concentration of the blood is a constant feature of shock. This is of clinical value both in recognizing the condition and in determining its degree. Shock produces characteristic changes demonstrable by postmortem examination. These consist of marked capillary and venous congestion of the viscera, edema of lungs and mucosae, petechial hemorrhages in serous and mucous surfaces, and effusion of fluid into serous cavities. Not only does shock occur following extensive surgery or trauma; it is seen in a wide variety of clinical conditions, including extensive burns, poisoning with various substances, metabolic intoxications, abdominal emergencies, and severe acute infections. Cerebral hemorrhage and other lesions of the central nervous system may terminate in shock, the mechanism of which is not evident. Perhaps prolonged vasomotor disturbance results in tissue asphyxia, which in turn causes capillary atony and permeability. Shock develops in varying degrees. Maximal degrees lead to death by circulatory failure. Lesser degrees may be followed by recovery or by death from pneumonia. Many cases of secondary pneumonia have their origin in this type of circulatory disturbance.—*Annals of Internal Medicine.*

Antivivisection Hospital Abandons Its Program.—For many years there has been an active antivivisection party in this country, which carries on propaganda by means of a journal, public meetings, and in other ways. One is the maintenance of the National Antivivisection Hospital at Battersea (in Southwest London). This is a general hospital with a proper staff of physicians, surgeons, and specialists. According to its constitution no

vivisectionist was permitted to be a member of the board of the hospital or of its medical, surgical, nursing or administrative staff. No remedies that were the result of any vivisection or experiments on animals might be used there. Every person on the staff was required before joining to give a pledge against vivisection. It has now proved impossible to carry on the hospital under these conditions. In 1929 there was a large surplus of income over expenditure, but since then there has been a deficiency, particularly in the income from legacies. The hospital has had to close three wards of one hundred beds. An application was, therefore, made to obtain the sanction of the high court of justice for abandoning the antivivisection conditions of the foundation of the charity. An affidavit, made by the senior honorary surgeon, was read, to the effect that in view of the advances in general medical knowledge it was impossible to run the hospital on the present antivivisection lines. No other hospital in England was run on antivivisection lines. A scheme was submitted to the court for power to change the name of the hospital to the Battersea General Hospital and to declare that the observance of the principles and practice of antivivisection were no longer to bind the hospital. Mr. Justice Eve said that he must approve the scheme. Though personally he sympathized with the original objects and principles of the hospital, the time had come when they were no longer practicable. Possibly the diminution of the hospital's income was due to the fact that everybody had now to pay so much in taxation that little was left for charity.—*London News Letter.*

Health! thou most august of the blessed goddesses, with thee may I spend the remainder of my life, mayest thou benignly dwell with me; for if there be any pleasure to be derived from riches, or if there be any delight bestowed on men, or respite from pains, with thee, blessed health, all these flourish and beam effulgent like the spring arising from the graces; without thee no one is happy.—Ariphron.

PUT ON THE FEED BAG

A good idea for horses, but not recommended for humans

Some people literally "put on the feedbag." They will, and do, eat anything that's put before them. Doubtless you are endeavoring to straighten out many such people.

A characteristic of such people is their belief that milk is "baby food"; likewise, many such people declare—"I don't like milk."

Sound reasoning will clear up the "baby food" argument—and Golden State Milk will do much to convert the "don't-likers." Such people open their eyes with amazement when they first taste the delicate, rich and wholly flavorsome milk that bears the name Golden State. It *is* outstanding in fine flavor.

There is a reason for this fine flavor. Years of study, careful research, plus fidelity on the part of the producers in carrying out the results of these studies, insures constant, unvarying fine flavor.

Why not try Golden State Milk in your home? It is so much easier to convince others if you are convinced yourself.

Colfax School for the Tuberculous

Colfax, California

(Altitude 2400 feet)

This institution is for the treatment of medical tuberculosis and of selected cases of extrapulmonary (so-called surgical) tuberculosis.

The Colfax School for the Tuberculous consists of five Hospital Units with beds for patients who come unattended and a Housekeeping Cottage Colony for patients and their families.

The Colfax School for the Tuberculous offers the following advantages:

1. Patients are given individual care by experienced tuberculosis specialists. The patient is treated according to his individual needs.

2. Patients are taught how to secure an arrest of their disease, how to remain well when once the disease is arrested, and how to prevent the spread of the disease.

3. Patients have the advantage of modern laboratory aids to diagnosis and of all modern therapeutic agencies.

4. The climate of Colfax enables the patient to take the cure without discomfort twelve months in the year. We believe climate is secondary to medical supervision and rest, but the fact remains that it is easier to "cure" under good climatic conditions than where these climatic conditions are absent.

5. Colfax is accessible. It is on the main line of the Ogden Route of the Southern Pacific R. R. and has excellent train service. It can be reached by paved highway, being on the Victory Highway, with paved roads all the way to Colfax.

RESULT OF SURVEY OF NATURAL BIRTH CONTROL IS GIVEN

Experts Hold Ogino-Knaus Theory Is Sound

Results of a local study-survey undertaken by the Latz Foundation, a Chicago institution for the promotion of "the natural birth control method" through application of the so-called Ogino-Knaus theory or rhythm theory, were announced by the foundation yesterday. They indicate a favorable reaction to the subject from medical authorities who were cited.

The survey was limited, it was explained, to obtaining opinions on the theory from the heads of gynecological and obstetrical departments of five medical schools in Chicago and from the present and four former presidents of the Chicago Gynecological society. Opinions from a few specialists and general practitioners known to have had experience in the application of the Ogino-Knaus theory also were included.

Latz Explains Purpose

Application of this theory of "the rhythm of fertility and sterility in women," as against the use of contraceptives, is fostered by the Latz Foundation, according to its president, Dr. Leo J. Latz, "for spacing births where physiological or economic reasons warrant such action, and to assist in overcoming apparent inability to have children."

All of the physicians quoted in the results of the survey as released by the Latz Foundation agreed "that the fundamental basis of the Ogino-Knaus theory are scientifically sound." The Latz Foundation is supported by proceeds from the sale of a book, "The Rhythm," by Dr. Latz who is a member of the teaching staff of Loyola University Medical School.

The book is described on its title page as "a discussion of the physiological, practical and ethical aspects of the discoveries of Dr. K. Ogino (Japan) and H. Knaus (Austria) regarding the periods when conception is impossible and when possible."

Dr. Curtis Gives Consensus

After reviewing the findings of the survey, Dr. Arthur H. Curtis, head of the departments of gynecology and obstetrics at Northwestern University and Passavant Memorial Hospital, stated the consensus as follows:

"Apparently it has been demonstrated conclusively by Hartman (Dr. Carl G. Hartman, embryologist of the Carnegie Research Foundation) and others that the egg of the human female does not live longer than approximately a day after it becomes free unless pregnancy occurs.

"It is also now generally accepted that the spermatozoa (the male elements), contrary to former belief, do not live longer than a day, or two days at the most.

Results in Regular Cases

"Finally, we now may state that, in the case of women with regular 28 day cycles, ovulation generally occurs 12 to 16 days before the onset of the cycle.

"In the normal individuals with regular cycles the occurrence of pregnancy is highly improbable except during a few days which begin 16 days before the onset of the cycle.

"There remains little ground to question further the scientific accuracy of these fundamentals. There does remain much ground for investigation on the exceptions which may be expected to occur in the case of this biologic law like all others.

"Moreover, there is great need for exact clinical observation to chart the way for the successful practical application of what has been learned in this most important development in medical science."

Authorities whose opinion was sought in the survey included:

DR. N. SPROAT HEANEY, chairman, department of gynecology and obstetrics, Rush Medical School, chief gynecologist and obstetrician of the Presbyterian Hospital.

DR. FRED L. ADAIR, chairman, department of obstetrics and gynecology, University of Chicago, and chief of the gynecological service of the Chicago Lying-In Hospital.

DR. F. H. FALLS, head of the department of obstetrics and gynecology, University of Illinois Medical School and University of Illinois Research Hospital.

DR. HERBERT E. SCHMITZ, associate professor of gynecology, Loyola University Medical School, where his father, Dr. Henry Schmitz, now in Europe, head the gynecological department.

DR. IRVING F. STEIN, president, Chicago Gynecological Society.

DR. MARK. T. GOLDSTINE, chief of the medical and surgical staffs, Wesley Memorial Hospital, former president, Chicago Gynecological Society.

DR. ANDREW C. IVY, head of the department of physiology, Northwestern University.

DR. JOSEPH A. TOBIN, director of nursing education, De Paul University and the university's nine affiliated hospitals, and president of the Cosmas and Damian Associates, organization of Catholic physicians.

DR. PAUL E. LAWLER, professor of obstetrics, Loyola University Medical School.

DR. PHILIP M. LAW, neurologist and member of the staffs of the Cook County and University Hospitals.

DR. A. E. LUCKHARDT, member of the staff of the Grant Hospital.

"Two years ago I became convinced of the authenticity of the Ogino-Knaus method," Dr. Heaney is quoted in the foundation's survey. "As a result I began advising its use to patients who rightfully wished to avoid conception. During these two years in every single case where the prescribed method was followed not a single pregnancy has occurred."

Dr. Ivy, who has done research work under Dr. Hartman, who reached conclusions almost identical with those of Knaus through experiment on monkeys, according to the survey, said:

"Biology might be called a science of rhythms whether it has reference to humans or animals. The best available evidence now supports the rhythm of reproductivity in man as well as in other mammals. There is absolutely no question of the existence of an optimum time of the fertility in women and there lies the crux of this whole problem. Nevertheless, just as there are exceptions to every other biologic law, so there must be exceptions to this one."

Reprint from "Time"

RHYTHM BIRTH CONTROL

The Pope frowns on all forms of contraception because they prevent the birth of children, prime purpose of Roman Catholic matrimony. A thoroughgoing realist, the Pope at the same time knows that many loving Catholics who fear to have children defy his pontifical frown. Therefore he decided that it is morally right and proper for Catholic couples to utilize the wife's monthly rhythm of sterility and fertility as a natural method of contraception.

The Pope gave permission to do so in his 1930 Encyclical on Marriage, **Casti Connubii.** Said he: "Nor are those considered as acting against nature who in their married life use their right in the proper manner, although on account of natural reasons of time or of certain defects, new life cannot be brought forth."

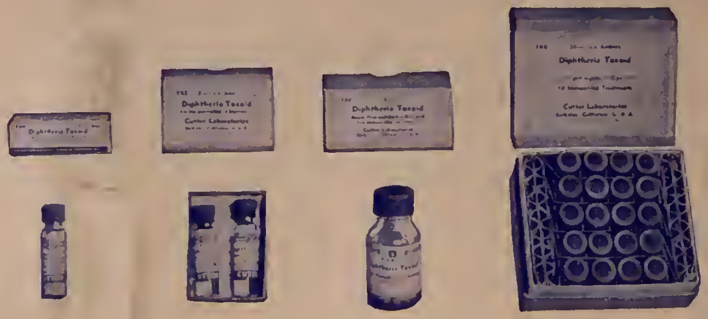
17th FLOOR, RUSS BUILDING . . . SAN FRANCISCO



Diphtheria Rate Increasing

U. S. Public Health Reports show a considerable, though not alarming increase in diphtheria incidence throughout most sections of the country. Many communities have now sufficient funds for widespread immunization campaigns but unfortunately, the most susceptible children, those of pre-school age, are largely out of reach of public health authorities. The protection or lack of protection of these youngsters depends solely on you as the family physician.

Yours the task of educating the parents as to the necessity for such protection, and the performance of the actual inoculation as well. Yours, too, the problem of choosing the method of immunization, and the maker of the vaccine. You will undoubtedly choose toxoid, either the two dose, or the one dose alum precipitate. As for the maker, you could not find more potent products than those produced by Cutter; and your choice, as a western physician, of products produced here in the west could not be logically questioned.

CUTTER *Laboratories*

GUILTY?

Were you GUILTY during 1935 of not using the facilities of your Bureau? . . . Did you phone your local office for credit information on new patients or delinquent old ones?

Did you make use of The Bureau's Tracing Department in locating lost debtors?

Did you use the Auditor's letter ("The twenty-five cent letter"), written and mailed for only 25 cents each? They get the money for you without antagonizing your "good but slow" patient?

And COLLECTIONS? Did you hold on to your delinquent accounts until many of them became hopelessly lost or uncollectible? Or did you "gamble" with them by placing them in the hands of an inexperienced, hard-boiled, or fine-sounding "gyp" collection agency?

If you failed to take the fullest advantage of the service offered in the above mentioned and other lines by your Bureau, let us urge that you do not be guilty of the same mistakes in 1936.

Begin the New Year right. Telephone or write your nearest office for any particulars. Approximately one-half of the members of the California Medical Association are finding The Bureau a very distinct help in all matters of business.

"Entered as second-class matter at the post office at San Francisco, under the Act of March 3, 1879." Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized August 10, 1918.

GREENS' EYE HOSPITAL

. . . for Consultation, Diagnosis, and Treatment of the Eye

THE HOSPITAL MAINTAINS

An outpatient eye department which functions daily from 9 a. m. to 6 p. m. A report of findings and recommendations for treatment is returned with patients who are referred for consultation.

An ear, nose and throat department conducted on the same basis as the eye department.

Emergency Eye Service

A twenty-four hour emergency eye service, including Sundays and holidays.

MEMBERSHIP ROSTER : C. M. A.

COUNTY SOCIETIES INDICATED BY KEY NUMBERS

This roster gives the list of members for the year 1935. Deceased members are indicated by *; resigned members by ¶; members transferred to other societies by §; new members who have been elected since January 1, 1936, by ‡.

KEY NUMBERS FOR COUNTY MEDICAL SOCIETIES

1. Alameda County.
2. Butte County.
3. Contra Costa County.
4. Fresno County.
5. Humboldt County.
6. Imperial County.
7. Kern County.
8. Kings County.
9. Lassen-Plumas-Modoc County.
10. Los Angeles County.
11. Marin County.
12. Mendocino-Lake County.
13. Merced County.
14. Monterey County.
15. Napa County.
16. Orange County.
17. Placer-El Dorado-Nevada-Sierra Counties.
18. Riverside County.
19. Sacramento County.
20. San Benito County.
21. San Bernardino County.
22. San Diego County.
23. San Francisco County.
24. San Joaquin County.
25. San Luis Obispo County.
26. San Mateo County.
27. Santa Barbara County.
28. Santa Clara County.
29. Santa Cruz County.
30. Shasta County.
31. Siskiyou County.
32. Solano County.
33. Sonoma County.
34. Stanislaus County.
35. Tehama County.
36. Tulare County.
37. Ventura County.
38. Yolo-Colusa-Glenn Counties.
39. Yuba-Sutter County.

COUNTY SOCIETY MEMBERSHIP TOTALS

(Year 1935)

Active Members in County Societies

Alameda County	459
Butte County	24
Contra Costa County	44
Fresno County	108
Humboldt County	28
Imperial County	24
Kern County	46
Kings County	18
Lassen-Plumas-Modoc County	11
Los Angeles County	2139
Marin County	39
Mendocino-Lake County	19
Merced County	23
Monterey County	46
Napa County	30
Orange County	109
Placer County	31
Riverside County	64
Sacramento County	144

San Mateo County	51
Santa Barbara County	103
Santa Clara County	172
Santa Cruz County	29
Shasta County	11
Siskiyou County	20
Solano County	23
Sonoma County	53
Stanislaus County	41
Tehama County	11
Tulare County	37
Ventura County	33
Yolo-Colusa-Glenn County	25
Yuba-Sutter County	13

Active members	5320
Associate members	6
Retired members	59
Honorary members	12
Total members	5397

Thirty-seven members died during the year 1935.

Note.—The California Medical Association by-laws provide for an annual directory. Because every member receives the annual directory of the Board of Medical Examiners of the State of California, and in order to avoid the great cost of duplication of such a directory, the California Medical Association Council has decided to print in the official journal a simple roster of members, giving for each member the city or place of residence, with a key number to indicate the county medical society in which membership is held. For additional information concerning school of graduation, etc., the State Medical Board directory or the central office of the California Medical Association should be consulted. Errors in the list here printed should be promptly reported to the central office of the California Medical Association, Four Fifty Sutter, San Francisco.

RESULT OF SURVEY OF NATURAL BIRTH CONTROL IS GIVEN

Experts Hold Ogino-Knaus Theory Is Sound

Results of a local study-survey undertaken by the Latz Foundation, a Chicago institution for the promotion of "the natural birth control method" through application of the so-called Ogino-Knaus theory or rhythm theory, were announced by the foundation yesterday. They indicate a favorable reaction to the subject from medical authorities who were cited.

The survey was limited, it was explained, to obtaining opinions on the theory from the heads of gynecological and obstetrical departments of five medical schools in Chicago and from the present and four former presidents of the Chicago Gynecological society. Opinions from a few specialists and general practitioners known to have had experience in the application of the Ogino-Knaus theory also were included.

Latz Explains Purpose

Application of this theory of "the rhythm of fertility and sterility in women," as against the use of contraceptives, is fostered by the Latz Foundation, according to its president, Dr. Leo J. Latz, "for spacing births where physiological or economic reasons warrant such action, and to assist in overcoming apparent inability to have children."

All of the physicians quoted in the results of the survey as released by the Latz Foundation agreed "that the fundamental basis of the Ogino-Knaus theory are scientifically sound." The Latz Foundation is supported by proceeds from the sale of a book, "The Rhythm," by Dr. Latz who is a member of the teaching staff of Loyola University Medical School.

The book is described on its title page as "a discussion of the physiological, practical and ethical aspects of the discoveries of Dr. K. Ogino (Japan) and H. Knaus (Austria) regarding the periods when conception is impossible and when possible."

Dr. Curtis Gives Consensus

After reviewing the findings of the survey, Dr. Arthur H. Curtis, head of the departments of gynecology and obstetrics at Northwestern University and Passavant Memorial Hospital, stated the consensus as follows:

"Apparently it has been demonstrated conclusively by Hartman (Dr. Carl G. Hartman, embryologist of the Carnegie Research Foundation) and others that the egg of the human female does not live longer than approximately a day after it becomes free unless pregnancy occurs.

"It is also now generally accepted that the spermatozoa (the male elements), contrary to former belief, do not live longer than a day, or two days at the most.

Results in Regular Cases

"Finally, we now may state that, in the case of women with regular 28 day cycles, ovulation generally occurs 12 to 16 days before the onset of the cycle.

"In the normal individuals with regular cycles the occurrence of pregnancy is highly improbable except during a few days which begin 16 days before the onset of the cycle.

"There remains little ground to question further the scientific accuracy of these fundamentals. There does remain much ground for investigation on the exceptions which may be expected to occur in the case of this biologic law like all others.

"Moreover, there is great need for exact clinical observation to chart the way for the successful practical application of what has been learned in this most important development in medical science."

Authorities whose opinion was sought in the survey included:

DR. N. SPROAT HEANEY, chairman, department of gynecology and obstetrics, Rush Medical School, chief gynecologist and obstetrician of the Presbyterian Hospital.

DR. FRED L. ADAIR, chairman, department of obstetrics and gynecology, University of Chicago, and chief of the gynecological service of the Chicago Lying-In Hospital.

DR. F. H. FALLS, head of the department of obstetrics and gynecology, University of Illinois Medical School and University of Illinois Research Hospital.

DR. HERBERT E. SCHMITZ, associate professor of gynecology, Loyola University Medical School, where his father, Dr. Henry Schmitz, now in Europe, head the gynecological department.

DR. IRVING F. STEIN, president, Chicago Gynecological Society.

DR. MARK. T. GOLDSTINE, chief of the medical and surgical staffs, Wesley Memorial Hospital, former president, Chicago Gynecological Society.

DR. ANDREW C. IVY, head of the department of physiology, Northwestern University.

Reprint from "Time"

RHYTHM BIRTH CONTROL

The Pope frowns on all forms of contraception because they prevent the birth of children, prime purpose of Roman Catholic matrimony. A thoroughgoing realist, the Pope at the same time knows that many loving Catholics who fear to have children defy his pontifical frown. Therefore he decided that it is morally right and proper for Catholic couples to utilize the wife's monthly rhythm of sterility and fertility as a natural method of contraception.

The Pope gave permission to do so in his 1930 Encyclical on Marriage, Casti Connubii. Said he: "Nor are those considered as acting against nature who in their married life use their right in the proper manner, although on account of natural reasons of time or of certain defects, new life cannot be brought forth."

DR. JOSEPH A. TOBIN, director of nursing education, De Paul University and the university's nine affiliated hospitals, and president of the Cosmas and Damian Associates, organization of Catholic physicians.

DR. PAUL E. LAWLER, professor of obstetrics, Loyola University Medical School.

DR. PHILIP M. LAW, neurologist and member of the staffs of the Cook County and University Hospitals.

DR. A. E. LUCKHARDT, member of the staff of the Grant Hospital.

"Two years ago I became convinced of the authenticity of the Ogino-Knaus method," Dr. Heaney is quoted in the foundation's survey. "As a result I began advising its use to patients who rightfully wished to avoid conception. During these two years in every single case where the prescribed method was followed not a single pregnancy has occurred."

Dr. Ivy, who has done research work under Dr. Hartman, who reached conclusions almost identical with those of Knaus through experiment on monkeys, according to the survey, said:

"Biology might be called a science of rhythms whether it has reference to humans or animals. The best available evidence now supports the rhythm of reproductivity in man as well as in other mammals. There is absolutely no question of the existence of an optimum time of the fertility in women and there lies the crux of this whole problem. Nevertheless, just as there are exceptions to every other biologic law, so there must be exceptions to this one."

SOUTHERN SIERRAS SANATORIUM

ARROWHEAD SPRINGS HOTEL and BUNGALOWS

Not a hospital or a sanitarium, but a delightful All-the-Year Resort located in the foothills six miles from San Bernardino, elevation 2,000 feet, with every facility for rest and recreation. Equipped with a complete Medical Department, including fully equipped Laboratory, Diet Kitchen, Physio- and Hydrotherapy departments, under the direction of a graduate M. D. Rheumatic allied disorders are benefited by the Natural Arsenical Steam Caves and Radio-active Arsenical Mud Baths.

Arrowhead Springs is not competitive, but supplementary, to the needs of the medical profession. The management extends a cordial invitation to the medical profession to visit ARROWHEAD SPRINGS whenever possible.

AVAILABLE THROUGH ALL PHARMACIES

EMMENIN

The orally active, oestrogenic placental extract elaborated by Dr. J. B. Collip, Department of Biochemistry, McGill University.
(Canadian Medical Association Journal, February, 1930.)

IMPORTANT ANNOUNCEMENT . . .

By an improved technique developed in our laboratories, we have been able to render Emmenin entirely free from disagreeable taste and odor. This has been accomplished without loss of therapeutic activity, and the potency is ensured by carefully controlled biological assay.

DETAILS ON REQUEST

Emmenin is biologically assayed and standardized under direct control of the Department of Biochemistry, McGill University.

A PALATABLE MEDIUM
FOR VITAMIN REINFORCEMENT

Awarded Ten Gold Medals
Maltine
WITH
COD LIVER OIL
CONTAINS VITAMINS
A, B, D and G
IN NATURAL FORM
THE MALTINE COMPANY
NEW YORK

MALTINE WITH COD LIVER OIL* has been esteemed by the medical profession since its introduction in 1875. It is of importance to the physician because it offers a pleasant means of administering cod liver oil and efficacious quantities of vitamins A and D. It also contains vitamins B and G. Constantly conducted laboratory tests on animals indicate that the vitamin A efficacy of cod liver oil is enhanced *two-fold* when emulsified in MALTINE, as in MALTINE WITH COD LIVER OIL. MALTINE WITH COD LIVER OIL and Iron Iodide is also available, containing two grains of freshly prepared iron iodide per fluid ounce.

*Containing Maltine 70%, cod liver oil 30%

Bacteremia and Oral Sepsis.—In searching for the source of streptococci concerned in the production of subacute bacterial endocarditis, Okell and Elliott state that attention must inevitably be turned to the oral cavity. The majority of endocarditis streptococci are of the salivary or Streptococcus viridans type. These abound in the mouth and its neighborhood, but are found elsewhere only in small numbers and under exceptional conditions; above all, it is in conditions of oral sepsis, such as pyorrhea of the gums, that this type of streptococcus is found in the greatest numbers. The blood was examined for bacteria in 138 patients undergoing extraction of teeth. Eighty-four of these showed a transient streptococcic bacteremia after extraction, and in cases considered to be of a severe type of oral sepsis (group A) the positive streptococcus cultures reached as high a figure as 75 per cent. In all cases from which streptococci were recovered, the organisms were of the nonhemolytic type. In the majority of cases in which the result was positive, streptococci were recovered from the cultures grown under aerobic and anaerobic conditions of cultivation, and in a few instances the organisms were found in the aerobic or anaerobic cultures. None of the streptococci recovered were obligatory anaerobes. In general, it was found that the occurrence and degree of a bacteremia depended on the severity of the disease of the gums and the amount of damage done at the operation. The bacteremia following extraction is of short duration. The transient bacteremia following operative trauma is analogous with that described by Barrington and Wright in catheter fever, in which Bacillus coli was the usual organism isolated from the blood. In persons with severely septic mouths, nonhemolytic streptococci (mostly of the viridans type) may enter the blood stream in the absence of any obvious trauma. The authors have been unable to ascertain whether the condition of "leak" into the blood stream in the positive cases is continuous, intermittent or merely a fortuitous single occurrence. Nor have they yet determined whether minor traumas, such as brushing the gums or chewing, have any effect on the occurrence of the bacteremia. The efficient mechanism, which exists for clearing the blood stream of organisms of low virulence, no doubt allows a leak of organisms into the circulation to be detectable in blood from an arm vein only when the leak exceeds a certain magnitude or the organisms are abnormally resistant to phagocytic clearing. The leak, which is of little consequence in the normal person, might determine the infection of diseased or malformed valves. The direct observation of such an invasion of blood provides a tentative explanation of how streptococci reach the cardiac valves in cases of subacute bacterial endocarditis.—*London Lancet.*

CO-OPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California and Nevada Associations. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

WILLIAM E. STEVENS, Pres. OTTO G. FREYERMUTH, Sec'y

THE CONTINUOUS COURSE IN

OPERATIVE SURGERY

Students May Enter at Any Time

The course will include a foundation in Anatomy, Surgical Pathology, Diagnosis, and Operative Technic. As supplementary to the work on cadavers, and fresh human material, lectures and demonstrations will be given on the living by leading surgeons of San Francisco. The hours will be arranged so as not to interfere with the practice of physicians in San Francisco and nearby cities and towns. Opportunity will be given to assist in operations, and some of the work will be done by the students themselves. The course will run every Tuesday from 11 to 3 o'clock.

Applicants must be graduates of schools approved by the State Board of Medical Examiners

For descriptive circular and further information, inquire of

Living quarters, dispensary, and office connected. Cheap rent. No pharmacist certificate required. Full price $500. Retiring. Address, Box 300, c/o California and Western Medicine, 450 Sutter Street, San Francisco.

Workmen's Compensation Acts: Physician as an Employee or Independent Contractor.—The Goodman Medical Association, composed largely of the employees of the Goodman Lumber Company, was organized for the primary purpose of furnishing medical and hospital services to its members. Dr. Jacob Gomber entered into a written contract with the association to perform such services as a physician and surgeon as were required to be furnished by the Goodman Lumber Company and another company under the Workmen's Compensation Act of Wisconsin, to testify in any case arising out of industrial accidents, to be superintendent of a hospital maintained by the association, and generally to render medical care to members of the Goodman Medical Association. On August 2, 1932, he was requested by the Goodman Lumber Company and the association to testify before the industrial commission. On the way to the hearing, he injured two fingers of his right hand when his automobile door closed on them. Infection set in, necessitating first an amputation of the middle finger and later on the amputation of his arm. He sought compensation under the Workmen's Compensation Act, and from a judgment of the circuit court confirming the order of the commission denying compensation, he appealed to the Supreme Court of Wisconsin. Pending the appeal, he died and his administrator was substituted as plaintiff.

It is obvious, said the Supreme Court, that the examiner, the commission, and the circuit court regarded the contract between the association and Doctor Gomber as requiring the latter to render only professional services. It has been generally held that the relation between a hospital and a physician employed by it is not that of master and servant. Physicians and surgeons employed by hospitals to minister to the sick and the infirm continue to be professional men who practice their profession according to their best judgment and discretion. While so practicing they are in no sense of the work subject to the orders or control of their hospital employers or bound in treating the sick to follow their directions. In a note in 19 A. L. R. 1183, it is stated:

> The decisions of which the rationale is that physicians and surgeons are not the servants of their employers are referable to the conception that they are "professional men" who are engaged on the understanding that they are to "exercise their profession to the best of their abilities according to their own discretion; but in exercising it they are in no way under his (their) orders or bound to obey his (their) directions." This theory as to the nature of their position necessarily implies that they are independent contractors—a designation which has sometimes been specifically applied to them.

In this case, however, Doctor Gomber was employed to perform many duties that were not professional in character. He served as superintendent of the hospital. While so acting, his status was that of a servant. *Schloendorff* v. *Society of New York Hospital,* 211 N. Y. 125, 105 N. E. 92, 52 L. R. A. (N. S.) 505, Ann. Cas. 1915C, 581. He also managed the hospital pharmacy, and in that capacity bought and sold drugs for the association. He was required to attend hearings of the industrial commission in which employees of either the Goodman Lumber Company or another company were interested. His attendance on such hearings was clearly under the control of the association. The association had the authority to direct him where and when to go. The Workmen's Compensation Act of Wisconsin defines employee to include: ". . . (4) Every person in the service of another under any contract of hire, express or implied. . . ." This language, in the opinion of the court, was sufficiently broad to bring the facts of the present case within it and to impel the conclusion that Doctor Gomber's status at the time he was injured was that of an employee. The judgment of the circuit court was reversed, with directions to reverse the order of the industrial commission and to return the record to the commission for further proceedings. (*Gomber* v. *Industrial Commission* (Wis.), 261 N. W. 409.)—*Medico-Legal News Item.*

NUTRI-AD
ARTHROPHYLL
(6)

A Nutritional Adjuvant

IN a wide variety of cases involving Arthritis Deformans also Arthritic and Rheumatic disorders due to calcium deposition NUTRI-AD Arthrophyll (6) has accomplished favorable results to a degree heretofore unreported.

By making available prolific sources of organic phosphorus in a highly assimilable state it is apparent that this natural agency for increased calcium excretion has been provided. » » » » » » » »

This procedure together with inducing normal bowel elimination offers a likely solution to this stubborn and widely prevalent pathology. » » » » » » »

NUTRI-AD—ARTHROPHYLL(6) consists of the concentrates of green leafy vegetables so compounded and proportioned as to supply a maximum of phosphorus and a minimum of calcium through which the offending calcium deposits are disintegrated and excreted.

NUTRI-AD—ARTHROPHYLL(6) is available only in prescription form through the ethical medical profession. Literature gladly furnished on request.

You Must Eat Meat. Fancies, Foibles and Facts About Meat. By Max Ernest Jutte, M. D., Formerly Lecturer on Stomach and Intestinal Diseases, New York Polyclinic Medical School, Member of the American Medical Association, New York State Medical Society, etc. Cloth. Pp. 164. Price, $2. New York: G. P. Putnam's Sons, 1936.

BOOK REVIEWS

Diseases of the Thyroid Gland. By Arthur E. Hertzler. Third edition. Pp. 348. Illustrated. St. Louis: The C. V. Mosby Company, 1935. Price, $7.50.

This book is the expression of one man's experience and impressions gathered over many years of goiter surgery. As a modern scientific book it is remarkable in that there is not a single reference to the voluminous literature on the subject of goiter. The value of the book, however, is not in the slightest decreased by this absence of bibliography as it is a well organized record of the observations and experience of a keen student and observer of his subject. Doctor Hertzler has developed a simple clinical classification of thyroid diseases and has put it to the test of time. He has little regard for

theory and contention and the book is entirely free of extraneous matter. He considers the disease of goiter as a continuous process, the normal termination of which is a cardiac death. The book is the story of how this normal termination can and should be circumvented.

The author has made many careful observations and records over a long period of years. He leads the reader along these same paths, pointing out the sign posts, warning of the dangers, prying into the dark corners and finally leaving him to draw conclusions which are almost certain to be the same as the author would have drawn.

For this reason I feel that this book should prove a reliable guide for the student who will be able to absorb from it the valuable observations of a keen observer gained over a period of many painstaking years. R. W.

A Manual of Southern California Botany. By Philip A. Munz, Professor of Botany, Pomona and Claremont Colleges, Claremont, California. Cloth. Pp. 642. J. W. Stacey, Inc., San Francisco.

An excellent discussion of the botanical classification and distribution of California plants. If you want to know your flowers, this text will be found most dependable and helpful.

The Pharmacopoeia of the United States of America. Eleventh Revision. Official from June 1, 1936. Mack Printing Company.

The trustees present the Eleventh Revision of the U. S. Pharmacopoeia. Would that physicians were more conversant with this text in order that they would discontinue proprietary prescriptions and depend upon U. S. P. remedies. This official text should be on every physician's desk for reference and study.

BOOK REVIEWS

(Continued from Preceding Page)

You Must Eat Meat. By Max E. Jutte. Pp. 164. New York: G. P. Putnam's Sons, 1936. Price, $2.

A rather primitive discussion to justify and increase the consumption of meat. There appears no real reason to justify its publication. The public can well do without it.

A Manual of the Common Contagious Diseases. By Philip Moen Stimson. Second edition. Pp. 437. Philadelphia: Lea & Febiger, 1936. Price, $4.

This manual offers sound, comprehensive, definite, concise, and helpful instruction. It is well arranged. As a clinical guide it should be useful to internes, industrial physicians and nurses, because it presents the salient features of contagious diseases.

Manson's Tropical Diseases. By Philip H. Manson-Bahr, F. R. C. P., London. Tenth edition. Illustrated. Cloth. Pp. 1003. Baltimore: William Wood & Company, 1936. Price, $11.

This is a manual on diseases of warm climates, giving adequate information. Six years have elapsed since the last edition. This tenth edition presents the progress made by science, thereby enhancing the value of this text. Adequately illustrated, concise in description, complete in covering tropical diseases. It is bound to maintain its place as an authoritative text.

Glandular Physiology and Therapy. A Symposium prepared under the auspices of the Council on Pharmacy and Chemistry of the American Medical Association. Pp. 528. Flexible leather. American Medical Association, publishers. Price, $2.50.

A compilation of a series of articles written by recognized authorities, published in the *Journal of the American Medical Association.* As indicated, they constitute a symposium on this important subject. It is appraised as the authoritative text and will guide the doctor so as to enable him to escape the wiles of the manufacturer's detail man as well as instructing him as to the merits of glandular therapy.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 232)

From an article on "Acute Cholecystitis" by William Watt Kerr, M. D., San Francisco.

In response to your request for some remarks about acute cholecystitis, I shall not attempt a description of the disease, but simply discuss some of the topics that come into the physician's mind when he is at the bedside with his patient.

From an article on "The Relief of Glaucoma by Subconjunctival Sodium Citrate Injections" by Hayward G. Thomas, M. D., Oakland.

Pathologists and clinicians are agreed that glaucoma represents in essence a state in which the eye holds an increased amount of water. As we had best now regard it, it is in reality an edema, and the increased pressure brought about by this means accounts for all the clinical signs and symptoms observed in the condition. As generally held, the increased amount of fluid contained in the eye in glaucoma is believed to be forced into the eye through such agencies as an increased influx or a diminished efflux of blood and lymph from the eye. The unsatisfactory nature of this idea is expressed in every textbook of ophthalmology. Martin H. Fischer, in his work on edema, has given another interpretation of the phenomena observed. . . .

History.—The first positive knowledge we have of plague among ground squirrels in America was the finding of one of the infected rodents on a ranch near Concord, Contra Costa County, California, in August, 1908. . . .

Time and Chance

Time and chance play an important role in discovery and invention. In the medical field, however, these factors can often be reduced by co-ordinating the work of physicians, chemists, biologists, and pharmacologists provided with suitable laboratory facilities. » » In the development of promising medical discoveries, the Lilly Research Laboratories and the associated large-scale production laboratories of Eli Lilly and Company provide investigators with the best known means for reducing time and eliminating chance.

From an article on "Some Features of the Squirrel Plague Problem" by George W. McCoy, Past Assistant Surgeon, United States Public Health and Marine Hospital Service, San Francisco.

Plague among the ground squirrels is one of the most important problems which the sanitarian on the Pacific Coast is called upon to consider. The subject is so large that some of the more important features only will be considered in this paper.

From an article on "The Status of Our Vaccine Work in Cancer" by P. K. Gilman, M. D.

Following experimental work, more particularly that of Van Dungren with whom one of us, Doctor Coca, worked for some months, we determined to apply to the human the methods of "vaccine" treatment in carcinoma that have been tried with various results on lower animals. In an attempt to secure a "vaccine" against a malignant growth, we used various methods of preparation; extracts of tumors, infusions, and differently prepared comminuted malignant tissue. We decided finally that a "vaccine" prepared as follows gave the best results. . .

From an article on "Three Cases of Probable Cancer Transplantation from the Use of the Gilman Vaccine" by W. B. Coffey, M. D., San Francisco.

In a series of some thirty cases of cancer treated by operation for as complete a removal of the tumor as possible and at the same time by the vaccine method of Gilman, there were three cases that presented an unusual result, inasmuch as tumors developed at the site of the injection. The history of the cases is as follows: . . .

Book Reviews:

Three Contributions to the Sexual Theory. Sigmund Freud, LL.D., Vienna, Journal of Nervous and Mental Diseases, Monograph Series, No. 9, Ninety-One Pages.

The brief monograph, as the title signifies, deals with the sexual problem. It may be characterized, in fact, an outline sketch of a new system of clinical psychology. Whether or no, therefore, one chooses to accept the author's doctrine, it is extremely interesting to follow the thread of his argument, if only to ascertain in what essential points he diverges from current beliefs. . . .

Tulare County Organized.—About twenty of the physicians of Tulare County, responding to an invitation sent out by the secretary of the State Society and a personal letter from Dr. Austin Miller of Porterville, met at the Palace Hotel, Visalia, on the night of January 21 and organized the Tulare County Medical Society. . . .

To me it seems as if when God conceived the world, that was poetry; He formed it, and that was sculpture; He varied and colored it, and that was painting; and then, crowning all, He peopled it with living beings, and that was the grand, divine, eternal drama.
—Charlotte Cushman.

There Is a Way of

"TELLING THE PHYSICIANS' STORY ETHICALLY"

A Director of the Physicians Expansion Bureau has been, or soon will be, in each city throughout the State to outline a plan of ethical advertising that will be scheduled to appear in each local newspaper weekly. The plan will be sponsored by one of the outstanding Prescription Druggists in each city. A large number of druggists have already sponsored this plan. Our yellow emblem identifies these stores.

These Better Health Talks that are to appear in the local newspaper weekly are designed to promote a closer relationship between the public and the Physicians. They also tend to counteract some of the detrimental propaganda fostered by the manufacturers of nostrums and cure-alls.

The coöperation of all Physicians is necessary in furthering this gracious gesture.

Physicians Expansion Bureau
Longacre Building
NEW YORK, N. Y.

negligent while treating his wife for ailments that resulted in her death last September." (San Francisco *Examiner*, February 11, 1936.)

"Dr. St. Louis Estes, health lecturer, was granted leniency yesterday by Federal Judge William P. James, who postponed sentencing of Doctor Estes for one year on his plea of guilty to mail-fraud charges. Doctor Estes was ordered to refrain from engaging in any promotional venture and to report to the probation officer every sixty days for the twelve months' period. . . ." (Los Angeles *Illustrated Daily News*, January 21, 1936.)

"With a young Alameda housewife in a serious condition as the result of an illegal operation, Oakland police today held Mrs. Mae Brazil, thirty-five, for investigation. Mrs. Ruth Johnstone, twenty-six, was taken to Alameda Sanitarium after her husband, Vern, had called in Dr. J. F. Brady to attend her. Doctor Brady, who charged the illegal operation was performed at Mrs. Brazil's last Saturday, reported the case to the police. (San Francisco *News*, January 29, 1936.)

"Mrs. Virginia Parsons, forty, of 317½ South Stanislaus Street, was arrested today in connection with the death of Mrs. Margaret Alvers, twenty-seven, who died in the County Hospital, Martinez, Monday, from complications following an alleged illegal operation. Mrs. Parsons will be charged either with performing an illegal operation or with manslaughter or both, District Attorney F. C. Clowdsley said. . . ." (Stockton *Record*, January 17, 1936.)

(Continued on Page 20)

TEN MILKS for INFANT FEEDING

but *KARO*

is a UNIVERSAL MODIFIER

	Milks	*Indication*
1	Whole Milk	Normal Feeding
2	Skimmed Milk	Infection Vomiting Diarrhea
3	Top Milk	Malnutrition Constipation
4	Soft Curd Milk	Intolerance Indigestion
5	Evaporated Milk	Prematurity Marasmus Eczema
6	Dried Milk	Intolerance Allergy Travelling
7	Acid Milk	Marasmus Diarrhea Celiac Disease
8	Protein Milk	Diarrhea Celiac Disease
9	Butter-Flour Mixture	Marasmus
10	Goat's Milk	Allergy

ARTIFICIAL feeding consists of cow's milk modified to the degree of adequacy of breast milk. The types of formulæ devised appear different—but successful mixtures contain approximately the same distribution in protein, carbohydrate and fat. Two-thirds of the total calories are supplied in milk and one-third in added carbohydrate. The formulæ contain 10-20% of the calories in protein, 20-30% in fat and 50-70% in carbohydrate.

Most infants tolerate whole milk. But those with irritable gastro-intestinal tracts, limited digestive capacities or allergic sensitivities, require milk adapted to their low tolerance. As a result, milk has been altered chemically in various ways to make it especially suitable for each type of infant feeding problem. The adjacent column reveals indications for various milks.

But the ten milks available for infant feeding can be safely modified with Karo. It is adapted to every type of formula devised. Karo consists of dextrins, maltose and dextrose (with a small percentage of sucrose added for flavor) practically free from protein, starch and minerals. Karo is a non-allergic carbohydrate, not readily fermentable, well tolerated, readily digested, effectively utilized and economical for both the baby and the budget.

Corn Products Consulting Service for Physicians is available for further clinical information regarding Karo. Please Address: Corn Products Sales Company, Dept. SJ-3, 17 Battery Place, New York City.

WHY CAMP SUPPORTS ARE SCIENTIFICALLY DESIGNED

THE Camp designing staff—with a combined experience of many years in the surgical support field—is constantly endeavoring to render in Camp garments the objectives of various groups of specialists consulted, as well as professional suggestions relayed by Camp nurses detailing all over the world and by Camp dealers.

From the eastern seaboard three years ago and a little later from the West and Midwest came this suggestion from obstetricians: the desirability of a diagonal pull, in addition to the straight around attachments, in a garment designed to support the abdominal walls without disturbing the relationship of the fetus to the pelvis. To effect this abdominal support, and at the same time to provide proper back support, was a task involving considerable difficulties. However, approximately twelve months later—after numerous conferences, many adjustments and trial by various pregnant patients—a new series of prenatal supports was completed, prenatal supports with a diagonal pull, proved by X-ray to support properly the abdominal walls without constriction at any point.

A comparable situation arose with a number of different internists. The desirability of a garment to fit snugly—without discomfort— over thin, protruding hip bones and yet to hold the abdominal organs as high as possible, was obvious from requests by physicians who had prescribed and found wanting in these respects many visceroptosis garments. To provide such a garment involved the manufacture of a specially made material pliable enough to fit like a hood over the crest of the ilium and sufficiently firm to support the abdominal organs. Only after two years of collaboration and painstaking investigation was there ready for distribution a series of such garments.

Thus is the designing room at the Camp factory a veritable melting pot of professional desires and design possibilities. This is why Camp supports are scientifically designed.

"Dr. J. Douglas Thompson, Oakland chiropractor and 'radio doctor,' will have until March 4 to subpoena the 185 witnesses he says he intends to have at his trial on a charge of selling a medicinal preparation with false advertising. . . . Doctor Thompson is free on $500 bail." (Oakland *Tribune,* January 20, 1936.)

"Previously convicted on fourteen counts of violation of the State Narcotic Act, Dr. Hugo Foss, Spring Street druggist, today faced one year in the city jail and a fine of $2,000, in lieu of which he must serve an additional day for each $2 unpaid. In his trial before Municipal Judge Oda Faulconer, officials of the State Medical Board and narcotic officers recommended that probation be denied, in face of his past record. Doctor Lester Crane (licensed by the Board of Osteopathic Examiners), 1546 North Western Avenue, today was in jail, where he will serve a 120-day term for violation of the State Narcotic Act. Dr. Crane was convicted two months ago of issuing narcotic prescriptions illegally." (Hollywood *Citizen News,* January 17, 1936.)

"E. B. Hartman, San Bernardino chiropractor, yesterday was released on $1,000 bail on charges of violating the State Medical Practice Act. Hartman recently was convicted on three counts of violation of the Act and the conviction sustained by the Superior and Appellate Courts. He paid a $180 fine. . . ." (San Bernardino *Sun,* January 10, 1936.)

"Dr. M. M. Kay, sixty-three, widely known Shafter physician, today was at liberty on his own recognizance following his arrest late yesterday on charges of violating

(Continued on Page 22)

For restlessness and irritability

Sollmann (A Manual of Pharmacology, 4th Ed. Saunders, p. 774), discussing the therapeutic uses of dialkyl barbiturates, says they have "a wide variety of applications: To secure sleep, to dull worry and apprehension and to calm nervousness and obtain tranquillity and rest in conditions ranging from 'overwrought nerves' through drug addictions, hyperthyroidism, mania, chorea, and epilepsy; . . . they allay the apprehension and greatly reduce the risk of operation."

Ipral Sodium (sodium ethylisopropylbarbiturate Squibb) is a dialkyl barbiturate which is rapidly and readily absorbed. It produces a sleep closely resembling the normal and usually free from deleterious after-effects. The therapeutic dose of Ipral Sodium is small and since excretion (by the kidneys) is prompt, undesirable cumulative effects may be avoided by proper regulation of the dosage.

Ipral Sodium is supplied in ¾ gr. tablets as a sedative, 2 gr. tablets for use as a sedative and hypnotic, and in 4 gr. tablets for pre-anesthetic medication.

Tablets Ipral Amidopyrine (2 gr. Ipral, 2.33 gr. Amidopyrine Squibb) provide both an analgesic and a sedative effect.

Both of these Ipral Products may be obtained in vials of 10 and bottles of 100 and 1000 tablets. For descriptive literature address the Professional Service Department, 745 Fifth Avenue, New York.

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M.D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer Wassermanns, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

ARTHRITIS

Clinical tests show 75% satisfactory results in the treatment of Arthritis with Hollister-Stier Bacterial Vaccine.

(BURBANK FORMULA)

Hollister-Stier Arthritis Vaccine contains a large number of strains of Streptococci, Staphylococci and a few strains of Diphtheroid Bacillus, all isolated from over three hundred active cases of arthritis. Most of these strains have been tested by complement fixation, also therapeutically, and have been found to be specific for this condition.

Hollister-Stier Arthritis Vaccine is put up in three dilutions, namely: One million, ten million, and one hundred million organisms per cubic centimeter. These dilutions are designated as dilutions A, B and C. A treatment consists of a 5 c.c. ampoule of each of the above dilutions. Additional ampoules of the C suspension may be obtained separately.

the State Narcotic Act. In jail were four alleged narcotic addicts—Louise Price, 38; Eddy Brown, 39; Ralph Wilson, 38; and Jean Wilson, 26—who assertedly obtained morphin from Doctor Kay. Authorities said the arrests followed months of investigation into the source of narcotics which have been finding their way to 'hopheads' in Bakersfield and throughout the county. The arrests were made by H. W. Perry, State Narcotic Inspector; Bob Knight, Narcotic Inspector of the Bakersfield Police Department; and Bill Lyons of the Kern County sheriff's office. Inspector Perry said that the Shafter physician admitted he had failed to keep a record of his purchases and sales of narcotics. Louise Price and Eddy Brown, who were arrested at San Luis Obispo after they had allegedly resold morphin obtained from Doctor Kay, pleaded guilty in the Bakersfield police court to a charge of obtaining narcotic prescriptions by giving fictitious names and addresses and were sentenced to the county jail by Judge Laird. . . . Officers expressed the opinion that the 'round up' would result in lessening of the flood of narcotics in Kern County. They reported they had been tracing an inordinately high rate of morphin sales to Shafter since last September. . . ." (Bakersfield *Californian,* January 24, 1936.) Dr. M. M. Kay of Shafter today pleaded guilty to one of five counts of violation of the State Narcotic Law, on which he was arrested last month and was sentenced by W. G. Ulery, Wasco Justice of the Peace, to thirty days in the county jail, the sentence to be suspended for two years. (Bakersfield *Californian,* February 7, 1936.)

"Still denying charges that she posed for a photograph with an elderly chiropractor, whom her husband assertedly forced to disrobe at the point of a gun, Mrs. Irene Taylor, young housewife, is to appear before Superior

"SLEEP IS THE PHYSICIAN OF PAIN" says *Sophocles* . . .

"Ciba"

Dial, "Ciba", is available in tablets · powder · ampules · elixir. Request sample and literature.

Dial, "Ciba", brings serene and refreshing sleep . . . to guard the irritated nervous system against further damage from lack of slumber. Thus, the patient's mental and physical states are benefited—nature is aided in the task of healing.

Dial—diallylmalonylurea—is quickly effective in much smaller doses than barbital, U. S. P. It is rapidly eliminated and in therapeutic doses exerts no injurious action on respiration or circulation.

Indications—As a hypnotic, Dial, for relief of insomnia; suggested dose 1 to 3 tablets. As a sedative, 1/4 to 1/2 tablet. Each Dial Tablet contains 1½ grs., approximately 0.1 Gm.

Judge Charles W. Fricke today seeking a new trial on an attempted extortion accusation. Mrs. Taylor, her husband, Walter Taylor, and Jerry Bellevue, a friend, who are to appear with her, were convicted recently of attempting to extort $1,400 from Dr. H. N. Tatem (licensed chiropractor). The doctor declared they demanded the money from him after he was photographed with the young woman in her home at 444 South Burlington Street on October 28. Each of the trio faces a possible prison term if a new trial is denied." (Los Angeles *Examiner,* January 17, 1936.) "Walter Taylor, his wife Irene, and Jerry Bellevue, convicted of extortion, were sentenced to prison terms yesterday after Superior Judge Charles W. Fricke rejected their pleas for mercy. . . . Each defendant was given six months to five-year terms." (Los Angeles *Illustrated Daily News,* February 5, 1936.)

"An Associated Press Dispatch from Phoenix, Arizona, today stated that Federal Judge Albert M. Sames had ordered Dr. Charles O. Long of Brawley to appear before the United States District Court there on February 20 for trial on a narcotic charge. He is charged with transporting a quantity of drugs from California to Phoenix. . . ." (Brawley *News,* January 28, 1936.) (Previous entry, June, 1935.)

"Eugene H. Donegan, forty, who identified himself as a chiropractor and who presided Wednesday night at a free public lecture here, featuring a 'Gravitonic Life Ray,' was lodged in the city jail last night. . . . Donegan was charged with violation of the State Chiropractic Act, which forbids chiropractors from representing themselves as otherwise than that type of practitioner." (Santa Barbara *Press,* January 28, 1936.)

(Continued on Page 26)

The Story of MEAD'S OLEUM PERCOMORPHUM

A NEW, ECONOMICAL, POTENT SOURCE OF NATURAL VITAMINS A AND D

Oleum Percomorphum, or Percomorph Liver Oil, is the achievement of an intensive, 10-year investigation conducted in the research laboratories of Mead Johnson & Company to find a natural oil more potent in vitamins A and D than cod liver oil and less expensive to the patient.

The U. S. Pharmacopoeia (IX, 1916, and X, 1925) recognized cod liver oil as the oil from the livers of fishes of the family *Gadidae*. There being some 50 species in this family, in addition to the type species, *Gadus Morrhua*, our first studies were directed at the examination of the more important species classed as cod. It occurred to us that somewhere in nature there might exist a species, or a family, or an order of fish, the liver oil of which would make possible a mixture comparable with Oleum Morrhuae but higher in vitamin potency.

The study was then directed to other species. By 1927 we had quantitatively compared the antiricketic value of oils from 15 species of fish and 11 other oils and fats. This was the most extensive survey of vitamin D sources reported up to that time. Outstanding in this list was puffer fish liver oil with a vitamin potency 15 times that of cod liver oil. Puffer fish were not available in commercial amounts, but the fact that one species of fish yielded so high a vitamin store provided great stimulus to investigators.

We discovered that the potency of fish liver oils increases with the leanness of the livers. With this revelation, we began a survey of all available commercial fish, as well as of rarer species. Collectors were sent to distant continents and to the islands of the Pacific and Atlantic oceans. From ports which never before knew cold storage we arranged to obtain refrigerated livers for our experiments. This ichthyological survey was interrupted (1928) at the time we introduced activated ergosterol.

In 1929 the Norwegian investigator, Schmidt-Nielsen, reported halibut liver oil to be superior to cod in vitamin A. Upon investigating, we felt then, as we do now, that while halibut liver oil marked a distinct advance it left much to be desired since it was perforce an expensive source of vitamin D. Hence it came to be used chiefly to supply vitamin A as a vehicle for viosterol.

Continuing the search for fish liver oils, by 1934 our laboratory staff had made thousands of bioassays of oils from more than 100 species to determine their vitamin characteristics. The results, reported in scientific journals in January and April 1935, were the culmination of a search literally of the seven seas.

With cumulative data on more than 100 species, it became evident that the fish belonging to the order known as *Percomorphi* differ from others in possessing, almost without exception, phenomenal concentrations of vitamins A and D. Thus we find liver oils which contain 50, 100, 500, and even 1,000 times as much vitamin A or vitamin D as average cod liver oil!

Percomorph liver oils are seldom equally rich in both vitamins. By skilful blending of the A-rich oils with the D-rich oils, a mixture is obtained which is about 200 times richer than cod liver oil in both vitamins A and D. As this concentration is so great that an ordinary dose of the oil could not be conveniently measured, we dilute the percomorph oil with approximately one volume of refined cod liver oil.

The resultant product is Mead's Oleum Percomorphum, 50%, which is 100 times cod liver oil* in both vitamins A and D. By a further dilution we obtain Mead's Cod Liver Oil Fortified With Percomorph Liver Oil, 10 times as potent as cod liver oil* in both vitamins A and D. Their respective potencies are 60,000 vitamin A units, 8,500 vitamin D units; and 6,000 vitamin A units, 850 vitamin D units (U.S.P.) per gram.

Just as Oleum Morrhuae is a mixture of the liver oils of various cod species (cf. U.S.P. XI, 1935, p. 261) so Mead's Oleum Percomorphum is a mixture of the liver oils of various percomorph species.** The significant difference is that the improved product is 100 times as potent* in both vitamins A and D.

Mead's Oleum Percomorphum, 50%, is available in 10-drop capsules, 25 in a box; and in 10 cc. and 50 cc. bottles. Mead's Cod Liver Oil Fortified With Percomorph Liver Oil is available in 3 oz. and 16 oz. bottles.

"Dr. William J. Cremin may own the house at 336 North Oakhurst Drive, where he was arrested Sunday for drunkenness and disturbing the peace, but the house is in the name of Mrs. Alta M. Archer, the occupant. Consequently, in suspending a thirty-day jail term, Judge Arthur L. Erb suggested that Doctor Cremin take civil action if his claim is true. At any rate he must not go to the house again, except in the company of his lawyer or other person, and he must not be arrested there again for intoxication; otherwise the suspended part of the sentence becomes effective. Doctor Cremin, who has been in court twice during thirty days on intoxication charges, paid a fine of $20 Monday." (Beverly Hill *Citizen*, January 31, 1936.) The name of Doctor Cremin is not found in the records of the Board of Medical Examiners.

"Dr. Samuel A. Twain, thirty-five, operator of the Twain Clinic at 1799 University Avenue, Berkeley, yesterday was held to answer in Superior Court on a charge of illegal possession of narcotics by Judge Oliver Youngs. . . . Yesterday Mrs. Lucinda Revello, a druggist of 2451 Sacramento Street, testified that on September 24, 1935, she filled a prescription for morphin sulphate made out to Edwin B. Clegg, 1492 El Dorado Avenue, and signed by Doctor Twain. Deputy District Attorney Arthur Sherry then introduced a death certificate for Clegg, dated August 16, 1935, also signed by Doctor Twain. He contended that it was evident that a prescription had been filled for a dead man. . . ." (San Francisco *Examiner* (East Bay section), February 7, 1936.)

Dr. L. J. Otis, fifty-three, Norwalk physician, was arrested yesterday by State narcotic officers for asserted violation of the State Poison Act. According to Jack Harrigan, who arrested Doctor Otis, the doctor was conducting a clinic and giving prescriptions to a list of fifteen known narcotic addicts. Harrigan said Otis was selling prescriptions for narcotics for $3 at the rate of two a week to each of the fifteen customers." (Los Angeles *News*, February 1, 1936.)

Reports relate that Earl Musgrave, licensed chiropractor, on December 17 pleaded guilty in the Municipal Court of Los Angeles to a charge of violation of Section 15 of the Chiropractic Act and was sentenced to serve 180 days in the city jail, suspended two years.

Differential Diagnosis of Enlargement of Cervical Lymph Nodes.—Farquharson states that the diagnosis of enlargement of cervical lymph nodes is usually made without difficulty on the history and the clinical and hematologic examination alone. Of the swellings affecting only cervical lymph nodes, difficulty is sometimes found in differentiating certain cases of tuberculous adenitis from lymphosarcoma and early Hodgkin's disease. A biopsy is often helpful in these circumstances, but the histologic picture is not always decisive and then the diagnosis may be determined only by the subsequent course of the disease. In patients with generalized involvement of the lymph nodes, one must be careful not to confuse infectious mononucleosis, which is never serious, with acute leukemia, which is always fatal. The differentiation is clearly made by clinical examination and study of the blood picture. The importance of history and clinical examination with a consideration of the blood picture is stressed. The information obtained by histologic examination of the excised gland is often useful but sometimes indeterminate and occasionally misleading. It should be considered together with all the clinical data in the final summing up of difficult cases.—*Annals of Otology, Rhinology, and Laryngology.*

The Discovery of Syphilis.—A short time ago, Haberling, professor of the history of medicine in Düsseldorf, discussed the question of the discovery of syphilis. In the last decade of the fifteenth century, which is replete with significant historical events as is scarcely another decade in the world's history, syphilis as a distinct disease entity first attracted attention. Astrologic interpretations having called attention to a sexual plague that would spring up in this decade, all Germany, through the blasphemy edict that was promulgated at Worms, August 7, 1495, became acquainted with the fact that a previously unknown disease called "die bösen Blattern," or virulent smallpox, had been sent down to earth as a punishment from heaven. In reality, as Haberling demonstrated, the disease was not new at that time, but had been known for many years among the so-called Wundärzte, by whom it was treated with mercury. Haberling also pointed out that, in spite of the comprehensive research of Sudhoff, the fable of the American origin of syphilis still bobs up even in studies apparently undertaken seriously. In Haberling's opinion, this fable is connected with the then growing trade in guaiacum wood, from which huge profits were realized. To strengthen the public faith in the efficacy of this wood, the absolutely groundless tales of the transmission of syphilis by the natives of Haiti to the sailors of Columbus were invented, a full generation after the discovery of America. Likewise the account of a devastating epidemic of syphilis in the vicinity of Naples and in German regions was a pure fabrication. Haberling pointed out also that, according to the researches of Sticker, along with the

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS
MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

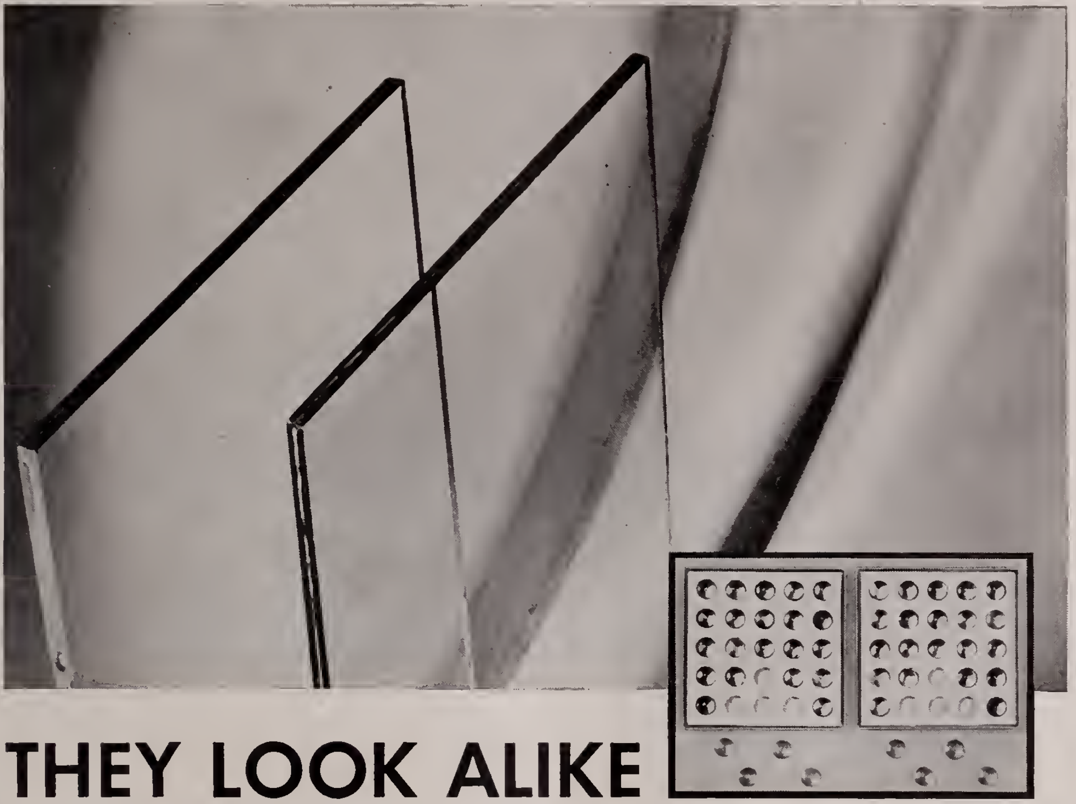
term "lepra vera," again and again one finds in the writings of the physicians of the Middle Ages the expression "lepra spuria," which, in contradistinction to lepra vera, did not require isolation and was curable. This lepra spuria, to which, in course of time, many other names were assigned, was doubtless syphilis, which, simultaneously with leprosy, was brought in from the Orient by persons returning from the crusades. — *Berlin News Letter.*

Time of Operation in Acute Appendicitis.—Krasnoselskiy studied 1,944 cases of acute appendicitis from the point of view of operative indications at various stages after the onset of the attack. The study of the pathologic alterations in the appendix demonstrated that neither the time elapsed since the onset of the acute attack nor the clinical picture made it possible to estimate the underlying pathologic condition of the appendix and of the adjacent structures. The prognosis cannot be established with any degree of certainty on these data. The author, therefore, believes that operation is indicated as soon as the diagnosis is made, regardless of the time elapsed or of the degree of severity of the clinical symptoms. Conservative treatment is permissible only in cases with well-defined palpable induration, provided the patient is kept under observation in the surgical division. The incidence of acute appendicitis in women was less than in men. It ran a milder course and its mortality was about one-third that occurring in men. The deciding factor in mortality was not the time element and the consequent loss of immunobiologic properties of the organism, but the pathologic alteration in the appendix and the surrounding structures. Comparison of a series of 500 cases up to January, 1933, with a series of 1,444 cases from January 1, 1933, to July 15, 1934, showed that the mortality was lowered from 3.2 per cent to 1.8 per cent. The mortality for the two series was 2.16 per cent: 3 per cent in men and 1.12 in women.—*Vestnik Khirurgii.*



THEY LOOK ALIKE

but there's a big difference . . .

Shatterproof and ordinary glass look alike. But the purchaser's safety may depend on the difference between them. Similarly, the difference between a full strength vitamin product and one lacking in potency can't be told by appearance . . . nor by taste or weight. The buyer of either such important products must rely entirely on the maker's ability to deliver quality, to overcome possibility of error.

Abbott's Haliver Oil with Viosterol offers very definite assurances of vitamin content. It is guaranteed by far more than willingness to make good a discoverable shortage. Instead, the Abbott guarantee has back of it three or more rigid assays (colorimetric, spectroscopic, and biologic for Vitamin A potency, and bio-assay for Vitamin D content), precise manufacturing methods, and Abbott's complete control of every detail in the product's production. Samples from manufactured lots are always kept and bio-assayed at regular intervals. Thus, proof of the potency exists when your patients buy this outstanding Abbott vitamin specialty.

To make sure that each of your patients receive these advantages, always write your prescriptions for *Haliver Oil with Viosterol*—and specify *Abbott!*

Available in handy boxes of 25, 100, 250 3-minim capsules; 5-cc. and 50-cc. vials with droppers.

Makers of Medicinal Products

The Diabetic Over Fifty

Coronary sclerosis is prevalent among older diabetic patients and it has been suggested that all diabetics over fifty years of age be treated as potential heart cases. Since an adequate blood-sugar level may be essential to cardiac nutrition, when Insulin is given in such cases there should be ample "coverage" with carbohydrate.

Iletin (Insulin, Lilly), the first Insulin commercially available in the United States, is supplied through the drug trade in 5-cc. and 10-cc. vials.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this journal.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS[†]

"I GIVE AND BEQUEATH"

An Excellent Thought.—Under the above title, Association Secretary Warnshuis calls the attention of members of the California Medical Association to the purposes of our organization and its worthiness to receive gifts and bequests from members who would wish to aid in the promotion of the general work or special activities of the Association.[*]

These aims are so deserving that it should be permissible to mention the Association's work to grateful patients of ample means who might wish to contribute to the advancement of scientific medicine.

In reading Secretary Warnshuis' comments on the subject, we remembered that about twenty years ago we drafted and printed some bequest forms in the catalogue of one of the institutions in which we held an administrative position. These were passed upon by the legal counsel of the institution and we print them below for their suggestive value.[‡]

* * *

Advancement of Scientific Medicine and Social Welfare Often Go Hand in Hand.—The advancement of scientific medicine makes not only for the conservation of human health and life, but, indirectly—by stressing the elimination of predisposing causes to disease that are so often associated with faults in social environments—is at all times a potent force in the promotion of the social and physical welfare of citizens. Gifts to the building up of scientific medicine, therefore, can go far to help make this a safer and better world in which to live.

* * *

Legal Forms for Bequests.—These bequest forms, to which reference has been made, are modified to apply to the California Medical Association. Bequests for specific work could be so specified. The three forms follow:

[†] Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column, which follows.

[*] For Secretary Warnshuis' comments, see page 208.

[‡] Editor's Note.—The bequest forms here printed were sent to the legal counsel of the California Medical Association, Hartley F. Peart, Esq., for check and insertion of the corporate name—the Trustees Of The California Medical Association.

FORM OF LEGACY

I give and bequeath unto the Trustees Of The California Medical Association, a California corporation, the sum of $——— to be held by it as a fund, to be known as the [here insert name desired] Fund, the principal whereof shall, from time to time, be invested by said corporation to the best advantage compatible with safety, and the income whereof shall be applied by it to the promotion and furtherance of the purposes and objects for which said corporation was formed, as more fully appears in the Articles of Incorporation of said Trustees Of The California Medical Association.

FORM OF DEVISE OF REAL PROPERTY

I give and devise unto the Trustees Of The California Medical Association, a California corporation, [here describe the property], the same, or the proceeds thereof, to be held by said corporation as a perpetual fund, to be known as the [here insert name desired] Fund, the income whereof shall be applied by it to the promotion and furtherance of the purposes and objects for which said corporation was formed, as more fully appears in the Articles of Incorporation of said Trustees Of The California Medical Association. Said Trustees Of the California Medical Association shall have the power to sell said property, and to invest and reinvest the proceeds thereof, from time to time, as may be deemed advisable by the Board of Directors of said corporation for the purpose of producing as large an income as may be compatible with safety.

FORM OF BEQUEST OF PERSONAL PROPERTY

I give and bequeath unto the Trustees Of The California Medical Association, a California corporation, [here describe the property], the same, or the proceeds thereof, to be held by said corporation as a perpetual fund, to be known as the [here insert name desired] Fund, the income whereof shall be applied by it to the furtherance of the purposes and objects for which said corporation was formed, as more fully appears in the Articles of Incorporation of said Trustees Of The California Medical Association. Said corporation shall have the power to sell said property, and to invest and reinvest the proceeds thereof, from time to time, as may be deemed advisable by the Board of Directors of said corporation for the purpose of producing as large an income as may be compatible with safety.

GOVERNOR FRANK F. MERRIAM REAPPOINTS PRESIDENT, SECRETARY, AND OTHER MEMBERS OF THE BOARD OF MEDICAL EXAMINERS: THE ASSOCIATION'S THANKS TO HIS EXCELLENCY

Under date of February 20, the newspapers of California carried a Sacramento dispatch which read as follows:

> Sacramento, Feb. 20.—Governor Frank Merriam today announced he had made seventeen appointments to six state boards:
>
> Appointed to the State Board of Medical Examiners were:
>
> Dr. Frederick DeLape, Modesto, reappointed for the term ending January 15, 1939.
>
> Dr. F. W. Didier, Wheatland, to succeed Dr. Percy T. Phillips of Santa Cruz, deceased, for the term ending January 15, 1940.
>
> Dr. Harry V. Brown, Glendale, reappointed for term ending January 15, 1939.
>
> Dr. William R. Molony, Los Angeles, reappointed to term ending January 15, 1940.
>
> Dr. Charles B. Pinkham, San Francisco, reappointed for term ending January 15, 1940.

The above action by Governor Merriam meets with the hearty approval of the organized medical profession of the State of California. Each of the physicians who were reappointed has given years of faithful and efficient service on the Board in carrying out the medical practice law, thus aiding in the conservation of the public health through protection of citizens from incompetent practitioners. Particularly pleasing to the profession is the reappointment of the Board's executive officer, Dr. Charles B. Pinkham.

It may be of interest for members of the Association to learn that much pressure was brought to bear on Sacramento in an effort to displace some of the board members who were reappointed. It is also gratifying to know that the director of the California Department of Professional and Vocational Standards, the Hon. William G. Bonelli, who in his official position must supervise each of the dozen or more examining boards of the State, also gives his wholehearted support on behalf of the maintenance of adequate standards. To His Excellency, Governor Frank F. Merriam and to Director William G. Bonelli, our thanks.

KERN COUNTY HOSPITAL SUIT: APPELLATE COURT ENJOINS SUPERVISORS FROM ADMITTING NON-INDIGENT PATIENTS

Decision of the Kern County Superior Court Upheld by the Higher Appellate Court.—On page 189 appears in full the text of the opinion of the Appellate Court, Fourth District (written by Mr. Justice J. Marks, and concurred in by Mr. Justice P. J. Barnard and Mr. Justice J. Jennings), in which they handed down a permanent injunction, making it illegal for the members of the Board of Supervisors of Kern County, or their agents, to admit as patients in the publicly owned and operated Kern County Hospital, citizens not belonging to the indigent class. This opinion, in its essential features, affirmed the decree of injunction rendered on December 4, 1933, by Judge K. Van Zante of the Superior Court of Kern County, from which appeal was taken by the Kern County Board of Supervisors.

The decree, as printed in this issue, is taken from "California Appellate Decisions" (Vol. 84, No. 3193, February 7, 1936), and should be read by every member of the California Medical Association; because it outlines, for California, those basic principles which legalize free medical and hospital service when paid for from public funds.

The members of the Kern County Medical Association, who several years ago had the courage to throw down the gauge of battle on this issue, are to be congratulated on the happy outcome, as evidenced by the ruling of this higher court.*

Congratulations are also expressed to the members of the legal profession, who, as attorneys for the respondents, and as *amici curiae*, presented arguments and briefs that had much to do with the important decision so happily rendered.

---

* On March 5, Legal Counsel Peart was served with a notice that the Supervisors of Kern County have appealed from the decision of the Appellate Court to the State Supreme Court.

The closing paragraphs of the opinion, as rendered by the Appellate Court, are of sufficient importance to be reprinted in this column, but members should read the entire opinion, in order the better to understand all the questions at issue.* The final judgment and decree follow:

It is therefore ordered, adjudged and decreed that the defendants Perry Brite, Stanley Abel, W. R. Woollomes, J. C. Hart, Charles W. Wimmer, individually, and as members of the Board of Supervisors of Kern County, and Kern County, a legal subdivision of the State of California, and each of them, and every officer, deputy, agent, appointee, subordinate, servant or employee of the above named defendants, or either or any of them, and particularly and especially the officers, deputies, agents, employees, appointees, servants, doctors, superintendents, heads of departments, internes, nurses, and assistants, and all other persons acting under defendants or any of them in any matter relating to the operation, maintenance, administration, or conduct of that certain County Hospital of the County of Kern known as the Kern General Hospital, be, and each of such persons is, and all of them are hereby forever permanently restrained, enjoined and commanded to desist from admitting to and receiving as patients of, caring for, curing, treating, boarding, nursing, furnishing food or supplies or lodging to, or hospitalizing in, said Kern General Hospital, or at or in any out-patient clinic thereof, any person who, after due inquiry and investigation, is not found to be an indigent person as herein defined, or a dependent or partially dependent person in case of emergency, or who is found, after due inquiry and investigation, to be a person who is himself, or has a relative or relatives legally liable for his support, able to pay for and obtain proper and necessary medical or surgical or hospital care or treatment or services for himself elsewhere than in the County Hospital except as hereinafter specified. The following should be admitted: †

(*a*) An indigent sick or dependent poor person.

(*b*) A needy sick and dependent or partially dependent citizen in case of emergency.

(*c*) A psychopath, narcotic addict or habitual inebriate temporarily in custody.

(*d*) A physically defective and physically handicapped person under the age of eighteen years when the parents or guardian of such person are not financially able to secure proper care or treatment and when such person's admission and treatment has been duly authorized in the manner provided by law.

(*e*) A person in the active stages of tuberculosis, in wards established for the treatment of such persons, who is able to pay for such treatment and who, when able to pay, is required to pay for such treatment.

(*f*) A person to be quarantined or isolated in the county hospital with a contagious, communicable or infectious disease.

(*g*) A prisoner confined in any city or county jail who requires medical or surgical treatment necessitating hospitalization where such treatment cannot be furnished or supplied at such jail when the Superior Court of the county shall have ordered the removal of such prisoner to the county hospital and said prisoner elects not to furnish such treatment at his own expense.

(*h*) A county employee injured in the course of his employment by the county when hospitalization is reasonably required to cure and relieve the effects of such injury.‡

(*i*) A person in need of immediate hospitalization on account of accident or sudden sickness or injury or by reason of sickness or injury caused by or arising in a sudden public emergency or calamity or disaster.

Provided,

(*j*) Nothing in this decree shall be construed as restraining defendants from obeying or carrying out or giving effect to any law that may be passed hereinafter relating to the hospitalization of patients in county hospitals which may affect the hospital in Kern County.

COUNTY SOCIETY VISITATION: THIS YEAR'S INTERESTING EXPERIENCE

Visitation Conferences with County Societies.—In almost every recent issue, California and Western Medicine has printed a list of visits made to component county medical societies by President Robert A. Peers of Colfax, Association Secretary Frederick C. Warnshuis and other State Association officers. The reports which have come to us, after some of the visitations, indicate that few lines of work are capable of resulting in so much good, both for the parent state organization and the component county units, as just such contacts and interchange of opinion. Particularly in the smaller and somewhat distant counties, are the beneficent advantages of county society visitation to be noted. On more than one occasion, where the topography of the country and absence of railroads made ease of access to the meeting place difficult, members have come, by auto, distances as great as one to two hundred miles, in order to be present at the conferences. Not only that, but practicing physicians in smaller cities and communities have been sufficiently alert to bring as their guests, to hear the messages which the Association officers presented, local colleagues whose names were not on the roster of the county society, and who, before the meeting ended, signed blanks for society membership. One other result brought to our attention on the very day of this writing was that of several physicians in a county in the southern part of the State, who had been invited as guests to one of the meetings, and who after the meeting signed applications for membership; thus giving to the community from which they came, the honor of having a one hundred per cent membership in the county society.

* * *

Beneficent Results of County Society Visitation.—As a result of this well-planned activity—which may be appropriately termed County Society Visitation—the members of the component county societies in the State have become more Association- and organization-conscious. As another consequence, too, the problems confronting state and county societies are much better appreciated than in previous years, and, with this clearer understanding, there has developed a more active coöperation on the part of many members who formerly were only casually interested in organization work; the result being that an increasing number of members are taking an active interest in bringing every eligible physician in their respective communities into affiliation with organized medicine. Results, such as the above, are certainly worthy of strenuous effort.

* * *

Thanks of the Association to Those Who Have Coöperated in the Visitation Conferences.—The California Medical Association is indebted to President Robert A. Peers, and also to his predecessors, including notably Dr. Clarence G. Toland, president in 1934-1935, for the services they have rendered in giving a real impetus to county society visitation programs. Thanks are due also to state councilors who have joined with President Peers and Association Secretary Warnshuis, and to the county society officers who have aided them to make these visits take on a helpful force; the influence of which will be felt, in good fellowship and professional ways, for years to come.

---

* For full opinion, see page 189.

† Editor's Note.—Paragraphs our own.

‡ See comment on page 189.

So successful has been this comparatively recent work that, from now on, county society visitation, carried on along carefully outlined plans, will be considered a definite responsibility of each year's organization program, and one to which the Association's president, councilors and officers may be counted on to give generously of their best efforts. Through such coöperative endeavors, the California Medical Association and its component county medical societies are more certain than ever to realize achievements in scientific and organized medicine, which they have set for themselves. Once again, thanks to all who have had a part in making the visitation conferences of President Peers' administration so successful.

ON THIS AND THAT

Proceedings of the County Secretaries' Conference.*—The minutes of the conference of State Association Officers and County Society Secretaries, held in San Francisco on January 18, are printed in this issue and will be found on page 210.

Members of the California Medical Association who desire to know more about the work of the parent state organization will find these stenographic reports of speeches and discussions of considerable interest; and as they learn of the intricacy of duties and problems, it may be hoped that some of the supposed mystery surrounding the work of state officers will fall away.

* * *

Advantages of Conferences.—Among the great advantages resulting from the secretarial conference, and of the county society visitations, are these: the workers in the State Association and the county societies are thus provided with an opportunity to meet one another face to face, and to explain their respective points of view or doubts; and through discussion of the best methods of procedure, to unite on plans of action, in which all effort is directed toward one harmonious end. The California Medical Association in recent years has expended many thousands of dollars which might still be in the Association's treasury, had it been possible, through preliminary conferences, to come to a common understanding on some of the matters which seemed to take on such paramount importance that immediate action apparently was necessary.

This fact is here mentioned not to criticize but simply to emphasize how valuable conferences may become to an organization, if through a free and leisurely exchange of opinion and discussion, hasty and expensive procedures may be reduced to a minimum.

The state and county officers, who attended the January 18 secretarial conference, gladly put in an entire day educating and rededicating themselves to the welfare of the California Medical Association and its component county societies. Perhaps you, kind reader, may also care to know on what topics the time was thus spent by those officer-colleagues, who gladly left their professional work, in the hope of learning how better to aid one another and you, in battling to advantage for the aims which scientific and organized medicine have mapped out for themselves, and to which the members of the California Medical Association are pledged.

* * *

Coronado Annual Session, Monday, May 25, to Thursday, May 28: List of San Diego Hotels; Prompt Reservations Necessary.—The opening paragraph of California and Western Medicine for February called the attention of readers to this year's annual session headquarters hotel—the Hotel del Coronado—and the fact that only twenty-five rooms had not been applied for. The hotel now reports a full reservation of all rooms.

However, on page 209, Association Secretary Warnshuis gives the names of other hotels in San Diego, and announces, also, that a ten-minute ferry service will be in operation from San Diego to Coronado Island. Members who wish to be sure of accommodations should promptly write to one of these San Diego hotels. Every effort is being made to anticipate the desires of visiting members; but those who hope to get superior hotel accommodations, without making reservations in ample time, are apt to be disappointed.

In next month's issue will appear the program of this year's annual session, and the urge to attend the meetings will then again be in evidence. Associated, as are the excellent scientific program and the social features, with the exhibits at the San Diego Exposition, all signs point to a very large attendance. To play safe, make your reservations now.

* * *

Attorney-General's Opinion on Division of Pathologic and Radiologic Services into Professional and Technical Fields.—In the department for Letters, on page 243, will be found the opinion of Attorney-General U. S. Webb, through Deputy Lionel Browne, in reply to a communication from Director Walter M. Dickie of the California State Board of Health, relative to the interpretation of certain sections of the 1935 nonprofit hospital law known originally as Assembly Bill 246, and now on the code books as Chapter

---

* For previous references, see February issue, pages 74 and 117.

386, Statutes of 1935. Under that law certain responsibilities were placed upon the California State Board of Health, and Director Dickie's communication was a request to the Attorney-General for clarification.

The legal principles involved in the interpretation of laws are well exemplified in this statute. The State Board of Health must govern itself by the opinions of the State's Attorney-General, unless such opinions are overruled by the proper courts. In the present instance, Deputy Browne points out the difficulties involved in having the office of the Attorney-General render an opinion on an abstract proposition, when, as a matter of fact, some of the legal points must be settled by the courts on separate and specific cases, and then only "upon a consideration of all the facts adduced and of the law applicable thereto." The letter of Deputy Browne, printed on page 243, should be read, not only by members of the profession associated with the specialties mentioned, but by all physicians who seek to orient themselves on the medical-legal principles under discussion.

* * *

Roster for 1935.—The roster of membership of the California Medical Association for the year 1935, with additions and changes of membership up to the date of printing of the March California and Western Medicine, is given place on the opening pages of this number. During the last several years, the Council has been printing the State Association roster in condensed form to provide members with a list which they could easily check with the additional information to be found in the Directory of the California State Board of Medical Examiners. The publication of the roster in this new form, as a part of the official Journal, means a saving in printing expense of more than one thousand dollars.

Last year's roster was printed in California and Western Medicine of September, 1935. It is gratifying to note, that in spite of the hard times, there has been no decrease in State Association membership. And further, that in the largest county unit of the State—in Los Angeles—where the application fee must be accompanied by a one hundred dollar pledge, this fee has not been a deterrent in securing new members; an indication of what a headquarters building and broad society activities can do for an organization. Let us hope that the coming year will be marked by a numerical and percentage increase in members greater than that to the credit of the last several years.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 208.

EDITORIAL COMMENT†

VITAMIN D TOXICITY

Physicians, in company with the general public, have become conditioned during the past two decades to considering vitamins as "accessory food factors." The implication of this conception, which is strongly supported by extensive commercial and advertising interests, is that vitamins are completely harmless and nontoxic, even in the highest conceivable dosage. Hints to this effect are not wanting in medical literature. The recognition of the chemical constitution of vitamins A, B, C, and D during the last five years has put an entirely different complexion on the matter. It must now be recognized that vitamins are drugs and that, in common with all drugs, they do have a definite toxicity in high enough dosage, and that there is a limit to the amount that may be used without invoking dangerous symptoms. The effective dosage of these drugs is very small. For pure crystalline vitamin D, for example, an effective daily dosage is about one-tenth of a milligram. That is, its dosage is less than any other drug now ordinarily employed. It is very important that physicians get away from prescribing vitamin D in terms of obscure units of variable biological activity, and insist that solutions or preparations of it be furnished in such a manner as to indicate clearly the percentage concentration of the pure crystalline material, so that it may be prescribed in milligrams of the pure drug.

Vitamin D has recently been recommended in high dosage in the treatment of arthritis.[1] Dreyer and Reed state that they have treated 700 patients with massive doses of vitamin D, and they admit that sixty-three showed signs of toxicity. This is a relatively high percentage of untoward reaction, and it raises the question as to whether the disease hazard justifies such a pronounced therapeutic hazard. The signs of vitamin D toxicity appear about two weeks after the high daily dosage treatment begins. The patient is nauseated, becomes dizzy, and has tingling in the extremities; and there may be vomiting, diarrhea and polyuria. A patient recently admitted to a California hospital with these symptoms, which were definitely attributed to excessive vitamin D intake, died in coma three days after admission. There is a very definite risk of clinical toxicity with vitamin D, of which all physicians should be aware.

There has been much scientific discussion of vitamin D toxicity. This has been complicated by the confusion between various preparations of irradiated ergosterol with vitamin D. The differences between vitamin D and other irradiated ergosterols is best determined by the study of the absorption spectra of the solutions of the materials. An excellent review of this matter has been prepared by Bills.[2] Vitamin D (calciferol) shows a maximum absorption band at 265 mμ. This material has antirachitic potency of 40,000 international vitamin D units per milligram. Too intense or too prolonged irradiation of ergosterol produces a series of substances with maximum absorption spectra below 250 mμ, which are definitely toxic, and which have only weak antirachitic effects. One such agent is called "toxisterol," because of its high toxic calcifying properties. This shows a maximum absorption band at 248 mμ, and must carefully be excluded from irradiated ergosterols offered for clinical use. The only protection at present afforded the medical profession or the public against the presence of this toxic agent in vitamin D preparations is the care with which manufacturers control their products.

---

† This department of California and Western Medicine presents editorial comment by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California and Nevada Medical Associations to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

[1] Dreyer, I., and Reed, C. I.: Arch. Phys. Therapy, 16: 537 (Sept.), 1935.

There is as yet no evidence to indicate what the chronic toxicity of vitamin D preparations may be, especially if contaminated with "toxisterol." This poisonous ingredient, which may be present in any irradiated ergosterol product if the irradiation is not carefully controlled, *is a powerful calcifying agent, but has no significant antirachitic properties.* This introduces a peculiar danger in the clinical use of vitamin D preparations containing it, since failure to obtain desired results from such preparations may lead the physician to use larger amounts, thus increasing the dose of the toxic factor. Long-continued administration of relatively small amounts of vitamin D preparations, contaminated with "toxisterol," may lead to gradual abnormal calcifications, whose presence may not be suspected for many years. There is clinical evidence indicating that excessive vitamin D itself, or even the natural crude drug containing it, cod liver oil, may promote cardiac disturbances or vascular abnormalities.

When one considers the extent to which the public is subjected to utterly uncontrolled irradiated food products, and the extent of the current fad of self-irradiation, equally uncontrolled, one is justified in expressing a word of caution in connection with the additional prescribing of, or self-medication with, high doses of an extremely potent drug formed by such irradiation. That such a word of warning is not out of place is apparent from the vitamin D deaths reported from England, and the recent one occurring in our own state.

GENES, HAPTENES AND AUTOCYTOTOXIC HORMONES*

During the last ten years immunologic research has led to the discovery of four basic physiologic facts:

(*a*) The colloidal and particulate permeability of mammalian epitheliums.

(*b*) Differences between the immunochemic specificity of different organs, tissues and body fluids of an individual and, at different stages of development, maturity and senescence.

(*c*) The "fractional antigenicity" of certain environmental crystalloids ("haptenes").

(*d*) "Heterophile antibodies" (anti-haptenes) that function as autoallergic or autocytotoxic hormones.

To clinical science the new facts suggest plausible explanations for numerous research failures of the past. General biologists may find the new data equally suggestive, particularly in their bearing on current theories of genetics and organic evolution.

CLASSICAL THEORIES OF EPITHELIAL DEFENSE

Belief in the colloidal impermeability of normal skin and mucous membranes was originally deduced from studies of osmotic interchange through sausage-skins, fish-bladders, and parchment membranes.

If egg-white, serum, milk or other proteinaceous material is thus dialyzed, the various simple salts and other non-colloidal components of the material are readily demonstrated in the dialyzate. Protein molecules, however, are apparently retained quantitatively by the membrane, the most delicate colorimetric test failing to detect a trace of protein in the diffusate.

It seemed obvious from such evidence that normal skin and mucous membranes were perfectly designed for the prevention of internal tissue contamination by environmental colloids.

This perfectionist theory became a major premise in practical clinical logic. It followed logically, for example, that food proteins must be hydrolyzed to peptones, amino-acids and other simple crystalloids before they can be absorbed from the gastro-intestinal contents into local capillaries or lymphatics.

Certain individuals are hypersensitive to one or more food proteins. These individuals give no allergic reactions with the final split products of protein digestion. Obviously, therefore, they must have an hereditary or acquired hyperpermeability of the gastro-intestinal mucosa.

RECENT PROOF OF EPITHELIAL PERMEABILITY

Experimental paradoxes and clinical inconsistencies, however, eventually led to a restudy of colloidal diffusion through animal membranes. It was found, for example, that measurable amounts of egg protein can be demonstrated in fish-bladder dialysates, by the simple device of evaporating the diffusate to a small volume and testing the concentrate with a high-titer specific precipitin.[1] From data thus obtained it is evident that in the neighborhood of 0.01 milligram egg protein per square centimeter hour may pass through this most perfect animal membrane.

---

* From the Department of Bacteriology and Experimental Pathology, Stanford University.

Presented before the Sigma Xi Club, University of California, Davis, October 16, 1935.

About the same rate of colloidal diffusion takes place through the gastro-intestinal mucosa. By applying some of the newer allergic techniques, for example, approximately one milligram undenatured egg protein has been demonstrated in the normal human circulation, within fifteen minutes after an individual has swallowed a raw egg.[2] In nursing mothers, approximately one milligram undigested egg protein has been demonstrated in the daily yield of breast milk.[3]

Similar amounts of plant protein have been found in the human blood stream within fifteen minutes after applying pollen to the normal nasal mucosa.[4] Contrary to previous clinical deduction, the rate of nasal absorption is less in hay-fever patients than in normal individuals.[5]

Bacterial proteins introduced into the normal human vagina are absorbed at a sufficient rate to stimulate the production of specific bacterial agglutinins.[6] Horse serum applied to palmar surfaces also allegedly stimulates specific antibody production. Alien proteins introduced into the blood stream of pregnant animals soon appear in the fetal circulation.

While there is no evidence that normal skin and squamous mucosa will allow the passage of particulate matter, internal tissue contamination is possible through certain more complex mucous membranes. If India ink, for example, is added to the diet of a laboratory animal, carbon particles may be demonstrated a few days later in the hepatic parenchyma.

Several hundred living bacteria per cubic centimeter have been isolated and grown from the normal canine circulation within ten minutes after intraduodenal instillation of homologous bacterial suspensions.[7] Half an hour after a dog has swallowed a commercial yeast cake, living yeast cells of the same commercial species may be recovered and grown from its liver, lungs, and kidneys.[8]

ENVIRONMENTAL DETERMINANTS OF HISTOLOGIC SPECIFICITY

Tissue contamination with colloidal or particulate matter is not the nutritional equivalent of absorption or contamination with equivalent amounts of digestive products. The final products of normal tryptic digestion retain no trace of the taxonomic specificities of the plant or animal colloids from which they were derived. Alien biochemical specificities, however, are introduced into living tissues as a result of contamination with biological colloids or particulate matter.

The amount of colloidal material necessary to cause demonstrable perversion or transformation of hereditary tissues is remarkably small. One milligram of horse protein, for example, injected subcutaneously into a guinea-pig, may cause specific allergic transformations, persisting for the lifetime of the animal. This allergic perversion may even be transferred to the second or third generation, largely as a result of transplacental fetal contamination. There is suggestive, though as yet inconclusive, evidence of a slight germinal (*i. e.,* spermatic) transmission.[9]

Paradoxic as it may seem, an acquired allergic transformation of hereditary tissues may function as a specific immunity.[10]

This constant "hybridization" of hereditary tissues with environmental colloids, is not a Creative error or Evolutionary imperfection. It is presumably a Purposeful part of evolutionary mechanics. Without this anti-environmental "vaccination," egg white today might have the toxicity of cobra venom, or the common putrefactive bacteria might function as bubonic plague.

HISTOLOGIC SPECIFICITY VERSUS BLOOD SPECIFICITY

Previous clinical theories of tissue specificity were apparently logical corollaries to the belief that cellular taxonomy is determined solely by hereditary genes. This belief was drawn from statistical evidence that blood specificity (*i. e.,* "blood grouping") is transmitted in strict accord with Mendelian laws. Since genes are assumed to be identical in all tissue cells, it seemed obvious that all histologic units of an individual must be of the same taxonomic pattern.

This obvious fact was confirmed by earlier specificity tests. Rabbits, immunized against rat kidney, for example, were found to yield specific precipitins, agglutinins, and hemolysins for rat blood. Immunized against rat blood, they yielded antiserums specifically toxic for rat kidney, liver and nervous tissues.

This unitarian theory of tissue specificity became a major premise in practical clinical logic. Since skin, bronchial musculature and gastrointestinal mucosa, for example, are identical in species specificity, it logically followed that allergic transformations must be qualitatively identical in these parts. An allergic skin test, therefore, was a reliable diagnostic test for the specific protein responsible for pulmonary anaphylaxis or food allergy.

The alleged isolation of bacterial strains with the power of "elective localization" in the kidney, irrespective of the animal species tested,[11] was obviously research quackery. Such a fanciful organ specific tropism would be equivalent to the assumption that kidney cells are of the same biologic species in all laboratory animals.

There was but one tissue then known to be thus non-species specific, the crystalline lens. Lens pro-

teins are approximately identical in antigenicity in all adult laboratory animals.

Restudies of histologic specificity by modern fractionation techniques, however, have revealed numerous other organs and tissues that do not conform to the earlier unitarian rule. Globulins isolated from the thyroid glands, for example, are immunochemically identical in many animal species.[12] Lipoid-free kidney proteins have been found to be organ-specific, as the discredited "elective localization" implied.[13] The corresponding liver proteins combine organ-specific and species-specific properties.

Brain lipoids are antigenically identical in most vertebrates.[14] These brain-specific lipoids are not present in early embryos. Certain embryo-specific lipoids, however, are present, only to disappear quantitatively shortly before or soon after birth. Lens proteins, nonspecific in the adult, are of hereditary blood specificity in the embryo.

To what extent this loss of hereditary embryonic lens specificity is due to functional use or environmental factors (*e. g.*, photodenaturation) is not known.

POTENTIALLY ANTIGENIC CRYSTALLOIDS

The earlier immunologists assumed that alien proteins are the only substances against which the animal body can acquire an appreciable degree of specific immunity or specific sensitivity. Considerable tolerance was known to develop against certain crystalloids, such as morphin. Morphin tolerance, however, is not serologically transferable, and is believed to be due to increased oxidation functions.

About ten years ago, however a number of experimenters[15] tested the possibility of conferring specific immunizing power upon presumably non-antigenic crystalloids by the simple device of conjugating them with protein "carriers." The specific capsular sugars isolated from type pneumococci were among the first crystalloids ("haptenes") to be thus conjugated. These sugars are not appreciably antigenic on subcutaneous injection into laboratory animals. Conjugated with egg white, however, the resultant saccharocolloids are successful anti-pneumococcus vaccines, protecting rabbits against experimental infection with multiple lethal doses of homologous pneumococci.[16]

Antibodies formed against such conjugates, however, are not strictly specific. They give relatively strong cross reactions with free protein "carriers." Thus, the serums of the above pneumococcus-immune rabbits will also react with egg protein.

The haptene or potentially antigenic crystalloid thus far studied in greatest detail is the "Forssman lipoid." This lipoid is a normal component of certain animal tissues. It is found, for example, in sheep erythrocytes and in the kidney of the horse and guinea-pig. Man and the rabbit, however, are "Forssman-negative."[17]

If Forssman-positive lipo-proteins (*e. g.*, sheep erythrocytes) are injected into a Forssman-positive horse, the resultant opsonins, precipitins, agglutinins, or proteolysins, have no demonstrable anti-Forssman function. Injected into a Forssman-negative rabbit, however, antibodies are formed giving "fractional" reactions with any Forssman-positive material. They react, for example, with Forssman-positive guinea-pig kidney. Injected intravenously into a guinea-pig, this serum may cause death within a few minutes, autopsy showing a hemorrhagic nephritis.

HORMONAL FUNCTION OF SPECIFIC ANTIBODIES

These studies suggested that animals cannot form antibodies against haptenes present in their own bodies, since such antihaptenes would be toxic for one or more of their own tissues.

There is convincing evidence, however, that such autocytotoxic antibodies may be formed, if the process of immunization is sufficiently prolonged. Monkeys given forty or more injections with alien nerve tissue, for example, eventually develop ataxia and paralyses,[18] presumably due to antibodies toxic for the monkeys' own brains.

The only autocytotoxic immunity thus far studied in adequate detail, however, is the auto-antihypophyseal immunity resulting from repeated injections with pituitary products. In rats such immunization eventually leads to a refractory state, characterized by a paralysis of the rats' own pituitary functions. Their basal metabolism is markedly subnormal, approximately identical with that in hypophysectomized rats.[19,20] This pituitary paralysis is serologically transferable.

Of greater interest to general biologists, however, is the well-confirmed fact that prolonged administration of certain ovarian products or "sex hormones" also leads to what is presumably an autoallergic or autocytotoxic immunity, characterized by hypertrophy, atrophy or degeneration of the patient's own ovarian tissues.

Whether or not the presumptive gonophilic antibodies can cause allergic transformations of hereditary genes has not been determined. Immunologists, however, have no reason to postulate that such transformations do not, or cannot, take place.

Proof of the existence of such a Purposeful gene-synthesizing or gene-transforming mechanism in the animal body, "heterophile antibodies" functioning as integrating hormones between environmental colloids and germinal cells, might go far to harmonize modern evolutionary theory with Fundamentalist philosophy.

CARDIAC CARE AFTER DECOMPENSATION*

By R. Manning Clarke, M.D.
Los Angeles

Discussion *by George Dock, M. D., Pasadena; William H. Leake, M. D., Los Angeles; Eugene S. Kilgore, M. D., San Francisco.*

THE heart is an organ of great reserves, possibly more so than other organs of the body. Sir Thomas Lewis says that when a heart has broken enough to have the early symptoms of decompensation, such as dyspnea, edema, etc., it has lost nine-tenths of its powers. If we accept this theoretical estimate of its reserves as a practical idea, it is clear to see that, when a decompensated heart is restored just enough to lose these early symptoms, it has gained very little, relatively speaking. The enormous margins that it should have are still lacking. It is surely a great mistake for the physician to feel satisfied with relief of the gross symptoms of decompensation. He should feel it his duty to continue supervision of the case until the margins of the heart can no longer be improved. If he has a true understanding of cardiology, he will know ways and means of assisting his patient to restore the badly needed reserves in some measure at least. On this account, he should hold a steady vigilance over these cases for long periods after the gross symptoms of decompensation have disappeared. It is only in this manner that the best results can be obtained, and the time of the next failure be held off.

PURPOSE OF THIS PAPER

This paper has nothing new to present. Its object is only to reiterate and reëmphasize the points that are so important in cardiac care at the time of this period after decompensation. Some patients stop treatment nicely and go on for some time with good compensation. Others are unable to stop treatment at all, or if they do, go for a short time only.

I would like at this time to emphasize the points that help us to tell ahead of time to which class these patients belong, and also assist us in their treatment after they are properly classified. There are many points that are helpful, but time and space will not permit of their discussion. I would like to take the matter up under the four following broad headings: 1. Cardiac rate. 2. Fibrillation. 3. Hypertension. 4. Venous pressure.

CARDIAC RATE

Counting the pulse is such a simple thing to do that we sometimes fail to think of it in terms of the proper respect. Our forbears in medicine learned much from it—more, I sometimes think, than we who have such an advantage over them in advanced knowledge of anatomy, physiology, biochemistry, etc. At any rate, it is still helpful to know the rate of the heart, and a little more so after decompensation than at other times.

After the withdrawal of digitalis, if the rate is inclined to stay above the conventional 72 while at rest, it is well to be wary and throw protection around that case in the way of restrictions and possibly the continuance of digitalis. The higher it stays the greater and more binding is the need for care and watchfulness. The conscientious physician will not drop his patient simply because dyspnea, edema, cyanosis, enlarged liver, etc., have disappeared, but will continue his supervision until he knows just how the heart is going to carry its load, and something about how much margin it has left after the load is carried.

As the rate of the heart increases, it is increased at the expense of diastole, which is the resting period of the heart. It is this fact that works the mischief. The coronary circulation goes into the heart only during diastole. Therefore, as this period is shortened the nutrition of the heart is also "shortened," and it is less able to do its allotment of work. The Thebesian veins are emptied by the squeeze of systole, and then once more the coronary circulation has its chance to nourish the heart during the relaxation of the next diastole.

The exhaustion of any muscle is due to the collection of lactic acid and other metabolites within it. Cardiac muscle seems to be a little more sensitive to lactic acid than the somatic muscles. When one looks at the facilities provided for the venous drainage of the heart, it is not hard, despite this fact, to understand its marvelous powers. This excellent venous drainage keeps it free from lactic acid concentration and the presence of harmful metabolites, and it is therefore hard to exhaust under normal conditions. Now, if a good, long diastole and free venous drainage are necessary under normal conditions, surely they are much more so under abnormal conditions, where a damaged heart is laboring under great handicaps to carry on its work. Many of these handicaps we are powerless to remove; but this question of rate is somewhat under our control, and we should at least watch it carefully under stressful conditions and use whatever powers we have to assist the crippled heart to maintain a moderately slow rate, get good nutrition, and stay free of metabolite concentration and exhaustion, thus building up as much reserve as is possible.

One of the most beneficial actions of digitalis is its ability to slow the rate of the heart, and this is many times the thing that breaks the vicious cycle of decompensation and starts the heart on its road to recovery. Now, after recovery from the congestive load of decompensation, the heart is often just getting by and its margins very, very small. If under these circumstances the patient is discharged, and has no further care or observation, it can very easily mean the early onset of another decompensation. On the other hand, if proper care is given and when the rate tends to get fast, digitalis is continued, the long diastole is maintained and the patient is protected over a long enough period, the whole picture is changed and the prognosis greatly enhanced.

---

* Read before the General Medicine Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13 to 16, 1935.

In other words, there are patients who are never able to stop digitalis after decompensation, and watching the rate is one of the ways of spotting these cases. The higher the rate the more dangerous it is to stop digitalis; because, as the rate goes up, lactic acid concentration, the oxygen debt, and other important factors in the vicious cycle of decompensation once more establish themselves, and "the fat is in the fire."

FIBRILLATION

The second thing in our list of four major points is *fibrillation.* This occurs most in thyroid and rheumatic hearts, but may also occur in degenerative lesions quite often. From the standpoint of decompensation, it is the most important arrhythmia because of its relative frequence, as well as from its ability to damage the heart. Fibrillation takes the honors in any list of arrhythmias for many reasons.

The rate of the heart is a prime consideration always in dealing with this arrhythmia. The menace of a fast heart rate has already been dealt with, but all that has been said about the rate is doubly binding in fibrillation. A fast rate in this case is not only bad for all the reasons previously named, but for others also. The prognosis of compensation varies directly with the ability to slow the heart. It is well understood by cardiologists that hearts fibrillating on a slow rate do nearly as well as those on a regular sinus rhythm. I have on rare occasions seen these patients hospitalized and put through extensive procedures in an effort to return them to a normal rhythm. In my opinion they had better be left alone.

Pulse Deficit.—In all fibrillating hearts, some of the contractions are weaker than others, and at times these grow so weak as to be unable to lift the aortic leaflets at all, and hence fail to propel the blood stream in its onward direction. It is a very exhausting thing for the heart to have a contraction that accomplishes nothing. It wastes and dissipates its energy in a most harmful manner. As the rate of the fibrillating heart goes up, these weak ineffectual contractions increase very rapidly in number and in proportion to the effectual beats. We have only one method of preventing these contractions, that is to reduce the rate, thereby greatly reducing their number or proportion. As has been explained, a fast rate is exhausting to any heart; but to a fibrillating heart it is doubly so because, in addition to the shortened diastole and its ill effects, is added the terrific loss of energy due to these weak and ineffectual contractions that become so numerous with the increase of rate. Fortunately, we have in digitalis a splendid instrument to assist us in controlling the rate and we must not fail to use it intelligently. We must not hesitate to continue its use indefinitely, if it is necessary to protect a struggling heart from the short diastole in any rhythm and from the pulse deficit of fibrillation.

The pulse deficit is so easily figured, by subtracting the rate as obtained at the wrist from the rate as obtained at the apex, that it pays everyone to do this, and have it charted if the patient is hospitalized, or has sufficient nursing care. It is very striking to watch the graph of the pulse deficit correct itself as the case is digitalized and otherwise compensated by good care. Auricular fibrillation is a vicious complication, and this by no means exhausts the listing of its dangers or the charges that can be brought against it. This only serves to emphasize the two most serious things that we need to watch in a heart that is struggling to regain power and reserves after a failure, when fibrillation is present. To do this is so easy, simple and practical that it needs to be constantly emphasized.

HYPERTENSION AND DEGENERATION

I wish to say that it is not the intention to in any way discuss hypertension. Rather, I wish to emphasize some points of our knowledge of physiology of the circulation and its hydrodynamics that can be used in a practical clinical way in thinking about these hearts that have once decompensated.

If hypertension is present and cannot be controlled, it greatly detracts from the general outlook, as far as preventing recurrences of the decompensation are concerned. So we should hold carefully in mind this fact, and if our patient has a hypertension after decompensation that we cannot reduce we must be cautious, for this case is in direct proportion to the degree and severity of the hypertension.

The reasons, while obvious, will bear repeating. The systolic pressure measures the working force of the heart. If it is high, it means that the heart is maintaining circulation by an expenditure of power that is at a much higher level than otherwise. This obviously will exhaust it more rapidly. Therefore, if it can be brought down by any means whatsoever, it should be done so as to conserve the energy of a struggling heart.

The diastolic pressure is the measure of pressure at the end of ventricular diastole. It measures the peripheral resistance as determined largely by the tonus of the arterioles. It is not so subject to influence nor to variations as the systolic pressure, and on this account is a better indicator of the work required of the heart. If the diastolic pressure is high, it simply means that the heart must expend that much more energy to lift the aortic valves before it can expend any energy in actually propelling the blood along the highway of the arterial system, toward the end of nourishing the body and otherwise carrying on the metabolism of the system or relieving the congestive load. On this account, if the diastolic pressure is high, it greatly adds to the burden of a heart that has been once decompensated and is struggling to carry on with greatly narrowed margins. Every effort should be put forth to reduce it.

The pulse pressure represents the changes in pressure that occur in any given artery as a result of the heart's contractions. This is, therefore, a measure of the force that is driving the blood toward the periphery. This is an accurate way of estimating the "load" that the heart must carry to maintain circulation. When this pulse pressure is high the heart is carrying more of a load to maintain circulation than it should. It is clear then that to increase the power and reserves of the heart, it is well to reduce this pulse pressure if it is at all possible. Practically speaking, there are five diseases that carry an increased pulse pressure. This little list should be kept well in mind, for whenever you meet one of them in routine examination you at once know that you are dealing with a heart that is expending more energy than it should to do its work. It this happens to be after a decompensation, it is also very evident that it would be well to do what is possible to reduce this pulse pressure toward the end of saving the heart the expenditure of unnecessary energy. The turning of this energy rather into reserves is of prime importance. The list is as follows: hypertension; hyperthyroidism; aortic regurgitation; heart-block; and acromegaly.

However, it is unfortunately necessary to admit that there are many cases of essential hypertension that we are unable to influence.

If there is any means that will hold the pressure down for any case of decompensation, as the patient is getting around again and beginning to look with hope to the future, it should be used. Its successful and continued use may add much time to the productive activity of the individual.

The Degenerative Lesions.—The greater the degree of arteriosclerosis atheromatous disease and fibrotic degeneration, the greater are the dangers to the heart after decompensation. This is one of the reasons why digitalis sometimes gets such a poor response in the aged. Nothing can make fibrotic tissue contract or assist the heart in its contractions. Therefore, when fibrotic replacement exceeds a certain definite amount, the muscle that is remaining finally becomes inadequate. If compensation is restored in such a heart, its ability to hold that compensation is, of course, in direct relation to the degree of degeneration that has occurred in it. It is seldom that a patient exhibiting pulsas alternans lives more than two or three years after its permanent onset under any circumstances, to say nothing of one that has been or is decompensating.

Extensive distortion of the great vessels over the heart, the presence of extensive hypertrophy of the myocardium, and the presence of pulsas alternans should always be taken into consideration when thinking of the prognosis and aftercare of a decompensated heart.

VENOUS PRESSURE

The normal venous pressure lies somewhere between 8 and 20 millimeters of water. In 1915 A. H. Clark published "A Study of the Diagnostic and Prognostic Significance of Venous Pressure in Cardiac Disease." He established at this time the fact that a venous pressure of 20 millimeters of water or over was a sign of cardiac failure. The moment the right ventricle allows the slightest residue of blood after systole, just that moment the venous pressure starts to rise. Eyster and Middleton in their publications have repeatedly pointed out the clinical value of this point. In other words, we should remember that venous pressure is an excellent indicator of right heart efficiency and, generally speaking, of the myocardium as a whole.

It is unfortunate that we do not possess better means of making a clinical, bedside reading of venous pressure than we do. Middleton has produced an instrument for doing it, but it has not met with wide recognition and use. However, there are many practical ways of estimating it clinically, and we need to constantly remind ourselves of these things. One of these things is that urine volume and venous pressure vary inversely. It is, of course, of no trouble to turn this to clinical use.

We need no instrument to enable us to observe the veins of our patient. If they stand out like whipcords it should make us stop and think, and of course means an increased venous pressure. The veins of the hands and arms should collapse or at least reach a theoretical zero of pressure when the arm lies at the cardiac level in a relaxed state. If they do not do so, it means an increased venous pressure. The veins of the head and neck, for obvious reasons, should have a negative pressure in them, more than that of the veins of the lower parts of the body and should be collapsed. If they are not so, then we know there is an increased venous pressure and a right heart that is threatening to decompensate if it has not already started to do so.

These are valuable clinical findings and indicators. When a decompensated case is convalescing and we are in doubt about stopping digitalis or about how much activity we can allow the patient, these are very important things to think about to guide us in forming that opinion. It is interesting to note in passing that Eyster and Middleton have shown venous pressure after venesection to be an excellent indicator of prognosis as to whether or not compensation will be restored after venesection in decompensation. "If the heart muscle responds adequately to the reduced load, the venous pressure will remain low, and the subjective and objective evidence of cardiac decompensation will subside. On the other hand, an early sharp rise in the venous pressure, or a steady return to its original high level, points to a lack of myocardial reserve and no continued clinical improvement can be expected."

TO SUMMARIZE

To review, in closing, our discussion of this clinical question of the care of the heart after decompensation, I wish to emphasize that I believe they fail of receiving the proper consideration during this time. I believe these patients could live much longer and with greater comfort and efficiency if more attention were given them after the gross signs of decompensation have disappeared. This paper is put forward as a means of emphasizing important landmarks that should guide us in our decision regarding them.

If digitalis needs to be continued to protect the weakened reserves of the heart, let us not hesitate to use it—indefinitely, if need be. Restrictions regarding rest and all activities should be continued in proportion to the need.

The four major things to be considered in deciding the need for continuation of treatment are as follows:

1. If the rate is above 72, at complete rest.
2. If fibrillation is present with a large pulse deficit (the faster the rate the more binding this statement).
3. If venous pressure is increased, as evidenced by prominent veins, especially in head and neck, or the arm if fully relaxed and resting at the cardiac level.
4. If hypertension is present, with markedly increased pulse pressure.

606 South Hill Street.

DISCUSSION

George Dock, M. D. (94 North Madison Avenue, Pasadena).—As I followed Doctor Clarke's presentation, I realized that I was listening to an unusually complete and sensible treatise on a very important class of patients. I noticed nothing important to criticize, but thought that here was a good paper to study when it appeared in print. It would be useful to every reader, no matter what his line of practice, to read paragraph by paragraph and ask himself whether he has known and observed all the points presented. Let me mention some of the points that I think especially worthy of emphasis. The matter of continuing supervision until the very best results have been obtained, is still occasionally forgotten. The matter of pulse counting is just as important, and it is strange that while instruments of precision have increased the value of the pulse in diagnosis, not a few patients express surprise when they find their radials objects of interest, and tell us they understood pulse feeling is no longer necessary. I am pleased to see the assumption that digitalis is the great remedy in patients with decompensated hearts. The physician should be very sure he has given digitalis a chance before he discards it for something else. The discussion of pulse deficit is very good, and here, too, minute observation of the situation is not sufficiently carried out. The pulse count is noted without regard to the apex beat only too often. At one time Sir James Mackenzie would not allow pulse counts made by nurses: all had to be made by physicians and checked by polygraph. Of course the latter can be dispensed with, but never combined counting of heart and radial. I close by repeating my advice as to careful study of the paper.

⁂

William H. Leake, M. D. (1930 Wilshire Boulevard, Los Angeles).—The after-care of patients who have recovered from congestive heart failure is of vital importance. It is regrettable that cardiac patients are discharged frequently by the physician with little or no advice concerning subsequent activities and medication. Systematic follow-up examinations are of great value in detecting signs of early heart failure, thereby enabling the physician to institute appropriate treatment.

Digitalis is a drug of inestimable value in the treatment of congestive heart failure but, unfortunately, it is used too sparingly by many general practitioners. The lack of response to digitalis in congestive heart failure accompanying the rheumatic and the degenerative types of heart disease, is frequently the result of inadequate dosage. This is especially true of the first attack. It must be remembered that with each "break" in compensation, response to treatment is less satisfactory. Heart failure secondary to syphilitic heart disease is notoriously resistant to digitalis therapy.

The necessity for counting the heart rate at the apex when arrhythmia is present must be emphasized. It is my opinion that the apex rate should be taken routinely in all cardiac patients, regardless of the rhythm. The frequent presence of "pulse deficit" in association with untreated auricular fibrillation, is well recognized. Attention should be called, however, to the existence of "pulse deficit" in certain cases of extrasystolic arrhythmia, auricular flutter and paroxysmal ventricular tachycardia. The "pulse deficit" disappears, as a rule, when the heart rate falls below 80 per minute. Attempts to revert established auricular fibrillation to normal rhythm by the use of digitalis are usually unsuccessful. This is of no importance, inasmuch as this type of irregularity causes little discomfort, provided the apex rate is not too rapid. The dosage of digitalis in chronic cardiac patients should be sufficient to maintain the heart rate between 50 and 70 per minute when the individual is at rest.

⁂

Eugene S. Kilgore, M. D. (490 Post Street, San Francisco).—Doctor Clarke rightly emphasizes the importance of the less obvious in the care of heart patients; and what he says might well be applied also to the period before definite decompensation has occurred. The earlier and milder manifestations of disease should receive more attention in medical teaching and in medical practice, and this is especially true of heart disease.

In the particular problem under discussion—the gauging of the return of cardiac reserve after decompensation—my interpretation of the criteria suggested by Doctor Clarke differs in certain respects from his. The pulse rate is affected by many factors other than the degree of cardiac reserve present. Many persons obviously in good health have, under conditions of rest, a pulse rate much over the conventional seventy-two. I once observed a young man who undoubtedly had excellent cardiac reserve (he was a very good sprinter), but whose pulse rate at rest was 180 to 200. Change in pulse rate may be of greater significance than the rate itself. A declining pulse rate is, of course, the rule during recovery from congestive failure; but while this is an important index of improvement, it does not seem to me to be the best general guide in controlling digitalis dosage, for the reason that the chief effect of the drug is not reflected in the rate of the sinus pacemaker. In treating congestive failure, the best effect of digitalis appears just below the toxic level; and it is usually desirable, after digitalis saturation, to continue the drug at a level a little below this and well through the period of convalescence, the dosage being guided by the appearance of toxic manifestations on the one hand and, on the other, by the ensemble of favorable effect on the pulse, the respiration, kidney function, the color and general appearance of the patient. Patients who have atrial fibrillation form the one notable exception where usually the pulse rate alone is an all-sufficient indicator of the digitalis effect.

The rising blood pressure frequently seen during recovery from decompensation is usually a return toward a higher level which antedated the failure. With Doctor Clarke, I see in this the disadvantage of added work for the heart, but it may also mean a better flow through the coronaries and renal vessels; so that, while unfortunate in certain ways, in general it is to be regarded as a favorable omen. A similar interpretation is applicable to the expanding pulse pressure frequently seen during recovery from heart failure.

To the items which Doctor Clarke has mentioned as guides in the management of convalescence, I would add the general appearance of the patient (facies, respiration, color, kidney function, etc.), and the patient's own observations. Remembering that, before any important cardiac reserve is established, the patient may become entirely comfortable at rest, the return to activity must, of course, be very gradual. For patients who have been orthopneic, the return to a horizontal sleeping posture should be accomplished cautiously. This and the later getting out of bed, walking a few steps, climbing stairs, etc., should all be regulated, not merely within the limits of comfort, but within limits which produce very little effect on pulse rate and respiration.

⁂

Doctor Clarke (Closing).—We have all observed hearts with a high rate that were slowed by exercise. It is quite probable that, could Doctor Kilgore have counted the pulse of his sprinter when he was in the middle of the hundred-yard dash, he would have found his rate very much lower than 180 or 200. The difficulty with this suggestion of

Doctor Kilgore's is that the sprinter's heart was undoubtedly of a sinus rhythm. Had he been working under an arrhythmia, I am sure he would not have gotten very far on the cinder pathway without going into a heap. The faster a fibrillating heart goes the greater is its arrhythmia and the more damage to its reserves. Surely, Doctor Kilgore would not try to tell us that the slowing of a pulse rate and the lengthening of its diastolic period is not good treatment, and an important point to observe in recovery from decompensation.

THE ASCHHEIM-ZONDEK TEST FOR PREGNANCY*

By E. Henry Ruediger, M.D.
San Diego

Discussion *by Gertrude Moore, M. D., Oakland; Alvin G. Foord, M. D., Pasadena; George D. Maner, M. D., Los Angeles.*

THE early work of Aschheim and Zondek[1] on sex glands and sex hormones progressed slowly because the rabbit was the only known suitable animal for the purpose. Rabbits became scarce and expensive, and some other animal had to be found. They soon found that immature white mice and immature white rats were suitable.

Working with immature female white mice they[2] showed that ovarian hormone in the blood or in the urine of a woman does not indicate pregnancy, and that fairly large quantities of ovarian hormone can be demonstrated in the blood and in the urine of women in many conditions besides pregnancy. They found that presence in the blood and in the urine of a substance which in the test animal causes hemorrhagic follicles and cellular proliferation in the ovaries, and probably premature ovulation like the reaction following the injection of an extract of the anterior portion of the pituitary gland, indicates pregnancy. They considered this substance to be a hormone secreted by the anterior portion of the pituitary gland.

VALUE OF STUDIES OF ASCHHEIM AND ZONDEK

Aschheim and Zondek[3] then showed that the test is practically specific for pregnancy by applying it to many other conditions with negative results. Twenty-six urines of normal, menstruating women all gave negative results. Six urines from old women gave negative results. Sixteen urines of unknown source gave results that agreed with the clinical findings. Three urines from women with irregular menstruation gave negative results. Of sixteen urines from men, one gave a positive result which could not be explained. Fifteen urines from women with internal diseases gave negative results. One urine from a woman with cystitis gave a positive result. Of three urines from acromegaly, two were highly toxic; they killed all the animals and one gave a positive result. Thyroid diseases gave negative results. Of twelve urines from women with infections of the genital organs, ten gave negative results and two gave positive results, and one of these had received Roentgen-ray treatment. Ten benign ovarian tumors and eighteen uterine myomas gave negative results. One case of uterine myoma gave a positive result and was found to be pregnant. Of sixty urines from women with cancer, fifty-eight gave negative results and two gave positive results. The two urines that gave positive results came from women with carcinoma of the ovary. Of 197 urines from normal pregnant women, 195 gave positive results and two gave negative results, and these gave positive results a few days later. After delivery, the results were always negative in eight days and frequently in five. After death of the fetus in utero, and after abortion the results became negative as soon as after normal delivery. In tubal pregnancy the results were positive while the fetus was alive, but soon became negative after the death of the fetus. Two urines from women with hydatidiform mole gave positive results.

In 1929, Friedman[4] reported on thirty-six urines from pregnant women, all of which gave positive results in rabbits.

OUTLINE OF AUTHOR'S STUDIES

The work reported here was done on rabbits, and the following questions are considered:

1. The most suitable age of the rabbit.
2. The time required for the reaction in the rabbit.
3. The Aschheim-Zondek test with urine from normal men and with urine from normal nonpregnant women.
4. The Aschheim-Zondek test in pregnancy.
5. Preservation of urine for the Aschheim-Zondek test.
6. The Aschheim-Zondek test in various pathologic conditions.

The Age of the Rabbit.—Female rabbits two months old, from three to four months old, and some adults were injected with urine from the same pregnant woman. The rabbits between three and four months old reacted better than the younger or older rabbits. I prefer rabbits between three and four months old.

The Reaction in the Rabbit.—A number of rabbits were inoculated at about the same time with urine from a pregnant woman; then some were examined after twenty-four hours, some after forty-eight hours, some after seventy-two hours, some after five days, some after seven days, some after ten days and some after twenty-one days. Twenty-four hours after injection there was a slight reaction in the ovaries; it was good after forty-eight hours; it reached its height in four or five days, then gradually subsided, leaving scarred masses with a few hemorrhagic points by the end of twenty-one days.

Urines from Normal Persons.—Five urines from normal men, five from normal nonmenstruating women, and five urines from five menstruating women all gave negative results.

Urines from Pregnant Women.—All rabbits were between three and four months old, and for diagnostic test each rabbit received about 12 cubic centimeters of urine, with a specific gravity of

---

* From the Pathological Laboratory, Mercy Hospital, San Diego, California.

1,020 intravenously, and was killed for examination two or three days after the injection. More than one hundred urines from pregnant women have been tested to date, and all gave positive results. On titrating some of these urines for hormone content, the highest titers were obtained fairly early in the pregnancy. Urines from women two months pregnant usually contained about five rabbit units per cubic centimeter (0.2 cubic centimeter of urine usually produced a fair reaction). In the fourth or fifth months, the urine contained two or three units per cubic centimeter, while at full term the urine contained about one unit per cubic centimeter. Of five patients who were examined after delivery all gave negative results with 12 cubic centimeters of urine, the usual test dose in five days. Urine usually contained twice as much hormone per cubic centimeter as did blood serum.

Tubal Pregnancy.—Four urines from women with ruptured tubal pregnancy were examined; two gave positive results and two gave negative results.

Abortion.—Four urines from women with incomplete abortion were examined; two gave positive results and two gave negative results.

Preservation of Urine. — Urine preservative tablets as supplied by life insurance companies were added to three urines from pregnant women, and the urines were kept in a dark place at room temperature. A year after having been voided these urines still gave positive results, but the titer of each urine had dropped from more than five rabbit units to about one rabbit unit per cubic centimeter.

THE TEST IN RELATION TO VARIOUS PATHOLOGIC CONDITIONS

Irregular Menstruation.—One urine from a woman with irregular and abnormal menstruation gave a negative result.

Chorio-epithelioma.—One case of chorio-epithelioma came under observation. The women expelled a hydatidiform mole and the urine of the patient gave a strongly positive result with the Aschheim-Zondek test. After expulsion of the mole the uterus remained large, there was much bleeding, and in three weeks the Aschheim-Zondek test had not become negative. The uterus was removed and showed extensive growth of chorioadenoma. The Aschheim-Zondek test became negative in a few days and was still negative five months after the hysterectomy. At the present time, three years after the hysterectomy, this patient appears to be perfectly well.

Systemic Diseases.—Three urines from women with diabetes and two urines from women with syphilis gave negative results.

Acute and Chronic Inflammations.—Two urines from women with mastitis, five urines from women with endometritis, five urines from women with appendicitis, and five urines from women with acute salpingitis gave negative results.

Thyroid.—Five urines from women with thyroid disorders gave negative results.

Benign Growths.—Ten urines from women with fibromyomata of the uterus were tested. Seven gave negative results and three were positive. In the uteri of those giving positive results, remnants of placental tissue were found which indicated recent abortion. These cases were operated on because of sudden severe hemorrhage. Five urines from women with ovarian cysts, one urine from a woman with teratoma of the ovary, and one urine from a man with teratoma of the testicle gave negative results.

Malignant Growths.—Three urines from women with carcinoma of the ovary, five urines from women with carcinoma of the uterus, five urines from women with carcinoma of the breast and three urines from women with carcinoma of the stomach gave negative results.

SUMMARY

Rabbits from three to four months old reacted better to the pregnancy hormone than did younger rabbits or older rabbits.

The reaction in the rabbit's ovaries developed slowly and subsided more slowly. It required from four to six days to reach its height and about a month to subside.

False positive results were not obtained with urines from normal men and with urines from normal nonpregnant women.

Urines from more than one hundred pregnant women all gave positive results. I have not yet obtained a false negative result.

Urines from pregnant women received preservative and were kept for one year. One year after having been voided they still gave good positive results, but had lost 80 per cent of their original titer.

Positive results were not obtained with urines from men and women suffering from various pathologic conditions, except in hydatidiform mole and in chorio-epithelioma.

DISCUSSION

Gertrude Moore, M.D. (2404 Broadway, Oakland).—That the clinician has learned to rely on the present-day hormone test for pregnancy, is increasingly evident. The test, when properly performed, justifies this confidence; for it is possessed of a high degree of accuracy, equal to that of most laboratory procedures. Depending as it does on the presence of living chorionic cells in contact with the circulation, it is not surprising that the highest titers are reached, not in normal pregnancy, but in those malignancies in which the neoplastic tissue is a new growth of chorion derivatives. It is, therefore, very positive in hydatidiform mole, and in chorio-epithelioma of either the male or female sex glands. Positive findings occur in pregnancy only while there is living chorion in contact with the maternal circulation, becoming negative rather promptly upon the separation or disintegration of this structure. For this reason the test is positive in almost 100 per cent of normal intra-uterine pregnancies, but falls far short of this ideal in ectopic pregnancy, as is noted in Doctor Ruediger's series. In tubal pregnancy, tubal abortion or rupture with death of the fetus and disintegration of the product of conception is not uncommon. Similarly, in intra-uterine pregnancy, a complete separation of the product of conception from the maternal wall may occur, with a negative reaction resulting, even though the sac has not been expelled. A dead fetus with living chorion attached to the uterine wall continues to give positive reaction. I would like to stress a few practical points, the performance or lack of performance of which makes the difference between a reliable result and one of questionable value.

The selection and care of the rabbits used in the test have an importance not to be overlooked, if we would have the highest attainable accuracy. The habit of some workers of buying rabbits of unknown age and mating history cannot be too strongly condemned. Injecting one such animal, and relying entirely upon the results obtained, is not the highest type laboratory procedure. The fact that fair results are obtained does not justify us in an indifference to the possibilities of materially improving the test if all possible safeguards are thrown around the procedure. The animal's age must be known in order to be sure of sexual maturity, for immature ovaries do not react. They must be kept in isolation, preferably for thirty days, since contact with animals, even of the same sex, may induce ovulation and destroy the value of the test. At least two animals should be used to each test, for it has been clearly demonstrated that about three and one-half per cent of mature rabbits are refractive to the hormone, and if used alone will give false negative reactions.

⁂

Alvin G. Foord, M. D. (Pasadena Hospital, Pasadena). Doctor Ruediger's results coincide, I am sure, with those of others doing sufficient numbers of tests to warrant conclusions. His selection of rabbits between three and four months of age is a point of great importance. Particularly is the use of too young rabbits to be condemned. Some of the earlier failures in using the rabbit test were due to this mistake. Another occasion for false negatives in the presence of pregnancy is the tendency of some physicians, usually at the insistence of their patients, to ask for a test too early in the pregnancy, such as one to three days after the menstrual period has been missed. Since it requires a certain length of time for sufficient hormone to be developed and excreted, it is best to wait at least ten days after the missed menstrual period before doing the test. In a small number of cases where the exact length of time between coitus and the rabbit test is known, it has been found that positive reactions cannot be expected before twenty-one days. In the case of a wife of a physician, however, when the test was made in our laboratory, where the time was accurately estimated, a positive Friedman result was obtained sixteen days after coitus, and subsequent obstetric history verified the time factors.

I personally believe, as does Doctor Ruediger, that false positives in non-pregnant women are usually due to laboratory error. Some of the earlier figures reported include such mistakes. In cases of teratoma testis, positive reactions with the rabbit are rare. The animal is too big and not sensitive enough for the amount of hormone passed in the urine. The mouse should be used instead, using Ferguson's technique or some other concentration method.

In conclusion, I wish to state that, inasmuch as a different animal is used, it appears to me only just that the rabbit test be given the name Friedman test, and that the mouse technique be called by its original name—the Aschheim-Zondek test.

⁂

George D. Maner, M. D. (657 South Westlake Avenue, Los Angeles).—The author entitles his paper "The Aschheim-Zondek Test for Pregnancy," but in the text refers to the use of rabbits; so I presume the test under discussion is, in reality, the Friedman modification of the Aschheim-Zondek test. The fundamental principles underlying both are the same, viz., production of changes in the gonads of the test animals by a gonadotropic hormone present in pregnancy urine. In the Friedman modification, the urine is injected intravenously into female rabbits.

The amount of urine within certain limits used seems to be immaterial—amounts varying from 5 to 20 cubic centimeters having been used by different observers; but it seems that the greater number of workers prefer from 10 to 22 cubic centimeters doses. Single injections of this amount, or multiple injections of split doses have been used with remarkably uniform parallel results. Either preadolescent, adolescent, or adult doses, may be used. In adult animals, experimental data show that ovulation is complete in ten hours; and some few workers even record their final reading or report at the end of eighteen to twenty hours, while others prefer longer periods such as thirty-six to forty-eight hours. Thus it appears that the time elapsed after injection does not have much bearing upon the accuracy of the test. I am in accord with the author that it is best to wait forty-eight hours before reporting final results.

The author brings out an important practical point in regard to the preservation of the urine specimens, and the maintenance of the hormone content in high concentrations. Another important and interesting observation is in his findings of high concentrations of hormone (amounts equivalent to 0.2 cubic centimeter) in early pregnancy. This is important and should be borne in mind, in that one finds frequent reported statements in the literature that "positive reactions in amounts less than one cubic centimeter urine" or "in amounts one-twelfth the usual dose of 10 cubic centimeters," are significant and constitute strongly presumptive evidence of molar pregnancy or chorio-epithelioma.

The author is quite fortunate in not having any false or incorrect negative reactions in his series, inasmuch as a small percentage of rabbits, for some unknown reason, are refractory to the hormone.

I regret that the author did not go more into detail as regards the application or limitations of the test to the diagnosis of ectopic pregnancy. I wonder if the two negative tests in his series were considered as incorrect negatives, or whether tubal rupture or abortion had occurred before the urine was obtained. In the latter instance one would expect the test to be negative in that the chorionic epithelium was either nonviable or not in contact with the circulation of the host. By the Friedman test a negative reaction may be obtained in about twenty-four hours after the separation of the placenta, in both uterine and extra-uterine pregnancy.

⁂

Doctor Ruediger (Closing).—Some credit is usually given the originator of a test. Aschheim and Zondek showed that during pregnancy a hormone is excreted in the urine which, when injected into other suitable female animals, produce a marked reaction in the ovaries. According to Aschheim and Zondek, the female rabbit was the first animal used; but rabbits were expensive. They then found that immature white mice and immature white rats also were suitable for the test, and they used mice because these were the cheapest.

Widal used the agglutination test as a diagnostic test for typhoid fever, and although the present agglutination test differs greatly from Widal's original test, it is frequently called the Widal test.

Wassermann used the complement fixation test as a diagnostic test for syphilis. This test was called the Wassermann test. Modifications have been many, but the test in general is still known as the Wassermann test. In my opinion, somewhat modifying or developing a test cannot be considered originating a new test.

Contrary to Doctor Maner's experience or opinion, I have not obtained negative results twenty-four hours after the birth of the child; negative results were obtained five days after delivery.

In the cases of tubal pregnancy all had ruptured, some probably fourteen days before the operation.

CANCER STUDIES: IN RELATION TO RESULTS OF TREATMENT WITH AN AQUEOUS EXTRACT MADE FROM THE CORTEX OF THE SUPRARENAL GLAND

A FIVE-YEAR REVIEW ON TREATMENT RESULTS IN INOPERABLE AND HOPELESS MALIGNANCIES*

REPORT ON 7,513 CASES

By Walter B. Coffey, M.D.
and
John D. Humber, M.D.
San Francisco

The cause of and the treatment for cancer constitute a problem of very vital importance to the public, to every medical school, hospital, and to the entire medical profession.

It is only within the last thirty-five years that this disease has been studied systematically from the experimental point of view.

PART I

DISCUSSION OF THE UNDERLYING PRINCIPLES IN THE FIVE-YEAR STUDIES BY THE AUTHORS

* * *

Woglom, in a meeting of the Pathological Society held in Philadelphia in 1931, divided this period of thirty-five years into three decades.

First Decade: (*a*) The transplanting of malignant tumors; (*b*) a method of protection against inoculation; (*c*) the resistance of cancer cells to various agents; (*d*) the hereditary nature of cancer in mice and (*e*) the transmissibility of sarcoma of the fowl was discovered.

Second Decade: (*a*) The growth rate of the cancer cell was determined and (*b*) two methods of producing experimental tumors were discovered.

Third Decade: (*a*) Another method of producing tumor growth was reported; (*b*) the chemical nature of the carcinogenic hydrocarbons in tar was established; (*c*) the amount of irritation necessary to initiate neoplasia was determined, and (*d*) some idea of the vast extent of the cancer problem—obtained from the fact that during the past five years in the research clinics conducted by us, we have had under observation 7,513 patients afflicted with cancer.

PRESENT OR FOURTH DECADE STUDIES

We are now in the *fourth decade*, studying the metabolism of the cancer cell and the endocrine imbalance as the probable cause of malignant tumors. Enough experimental work and evidence will be given to show that these newer points of view are proving to be of unusual importance to the understanding of the nature of the malignant process.

The American College of Surgeons, as well as many other organizations, has made cancer research a part of its permanent program.

HIGH CANCER MORTALITY EMPHASIZES NEED OF INTENSIVE EXPERIMENTAL STUDY

We are all familiar with the high and tragic death rate in our own country because of cancer, and it behooves all of the medical organizations, foundations and societies to continue to enlist their best efforts against this scourge. Some organizations have for their primary object research study relating to the cause of cancer; others exhibit more interest in the control of patients and profits. I think you will agree with us that the problem should be kept free from any semblance of commercialism.

AUTHORS' STUDIES IN LAST FIVE YEARS WERE CONFINED TO HOPELESS CASES

It should be kept in mind that our work of five years' clinical study and research has been entirely among the hopeless cases, suffering from some form of malignancy; all abandoned because present usages, such as surgery, x-ray and radium, were of no avail. It has been our uniform policy to refer all incipient or early cases to present usage for treatment.

AUTHORS' VIEWS CONCERNING THE CONSTITUTIONAL NATURE OF MALIGNANCIES

At the inception of our work, theoretically we were of the opinion that malignancies were constitutional and could be explained on the basis of a deficiency; that the normal functioning of the cell was a mitosis; that there was a controlling element to govern this act, or function; that this chemical governing element was an active principle or hormone supplied by the adrenal cortex, and found in other tissues of the body. Quoting from our original article published in the September, 1930, issue of California and Western Medicine:

"First, cells with no definite function, and without a controlling element, might become what we would then term 'anarchistic cells,' growing and multiplying at a rapid rate without proper relationships to other tissues and cells of the human body.

"Second, if cells of the human body, during their functional activity, received an insult by bacterial irritation, trauma or otherwise, such cells might likewise begin to multiply and give expression to themselves," and, we might add, in the form of pathological mitosis. In any case, a controlling element, that is, a chemical governor, or stabilizer, is necessary for the normal function of a cell.

AS TO THEORIES ON ETIOLOGY OF CANCER

There have been many theories as to the cause of cancer, the most common of which is trauma. Of course, trauma may be divided into many types: that of direct blows, chronic inflammatory conditions, and it is probably consistent to include, under this heading, from the standpoint of an irritating process, the parasite, virus and bacterial agents—these organisms acting either as a direct irritant or indirectly affecting the chemistry of the cell.

---

* Read at the St. Francis Hospital meeting of the session of the American College of Surgeons, October 22-November 1, 1935, at San Francisco, California.

In the medical literature we find that the incidence of the increase of cancer of the lung, pharynx and larynx during the past several years, from surveys made in the large cities of the world was due, it is assumed, to irritation from carbon monoxid, produced chiefly from the exhaust of gasoline engines.

Carozzi of Geneva, at the International Cancer Congress at Madrid, 1933, mentioned the increase, in a reverse ratio, in cancer of the rectum in females, which is commonly attributed to the common use of heavy oil. If such is correct, both of these could, likewise, be placed in the category of traumatic irritation.

THE INDIVIDUAL CELL AS A BASIS FOR INVESTIGATION

In this *fourth decade,* in the field of pathology, it is recognized that the individual cell is the basis for most investigation. Investigators are studying the anatomical structure of its physiology from the viewpoint of both metabolism and catabolism; that is, the study of the chemical and biochemical nature of a cell, and the changes which might take place in its histological structure, which would lead on to a pathological mitosis.

IN MALIGNANCIES, HOW DOES NORMAL CELL TAKE ON PATHOLOGIC NATURE?

In our original paper we called attention to the fact that malignancy should be studied from the physiological, biochemical and histological standpoints, and also the reason behind the mystery of the change from a histological to a pathological mitosis.

What are the influences and underlying reactions which are taking place in this cell, which eventually bring about this pathological condition?

The study of the relationship between carbohydrates, lipoids, amino acids and other constituents involved in anabolism and catabolism, may help to solve this problem.

When the normal cell life is altered to any degree, with a perversion of its original function, it can then become what we term a malignant cell.

Any change in the normal function of a cell depends upon two factors: intrinsic or extrinsic influences. Abnormal changes in the action of either of these two properties cause a mutation of the cell to a different form, or result in its final extinction.

AUTHORS' VIEW THAT THE CONSTITUTIONAL FACTOR BEHIND THE CANCER CELL IS A DEFICIENCY OF AN ACTIVE PRINCIPLE SUPPLIED BY THE CORTEX OF THE ADRENAL GLAND

In the development of the malignant cell, the underlying constitutional factor is intrinsic, due, we believe, to the deficiency of an active principle supplied by the cortex of the adrenal gland, and found in varying quantities in tissues throughout the body. This active principle, or hormone, when normally supplied, prevents the mutation of the normal cell characteristic of malignancy.

CONTRADICTORY REPORTS CONCERNING ADRENAL EXTRACTS

Although several investigators report that they have obtained negative results with adrenal extracts in experimental tumors in animals, it is also true that other workers have obtained positive results. While it is difficult to judge negative results in this connection, it should not be forgotten that the variability in different types of tumors, animals and human beings, and most important of all, variability in potency of extracts, all are factors that should be evaluated before much significance is attached to negative results. The activity of hormone preparations can easily be destroyed if the details in their preparation are not followed very closely.

AUTHORS' STUDIES OF SYMPATHETIC NERVOUS SYSTEM: THE INFLUENCE OF THAT SYSTEM ON THE DISTRIBUTION OF THE ACTIVE PRINCIPLES OF SUPRARENAL GLANDS

Our studies of the sympathetic nervous system have demonstrated what an important part this system plays upon the innervation of the suprarenal cortical cells, influencing the distribution to the general system from the suprarenal gland, of this active principle, or hormone.

The metabolism of the cells of the entire body, and the biochemical change which actually takes place, not only in the normal cell, from day to day, but the cell that is passing through a transitional stage into that stage which we choose to term a malignant one, are of paramount importance. A study along these lines will be reported later.

REACTION OF ACTIVE PRINCIPLE OF SUPRARENAL GLANDS ON CELLS OF DIFFERENT CANCER TYPES

The relationship between the type of malignancy and the reaction of this active principle upon malignant tissue, is an interesting study. In studies in our laboratories and clinics, we have observed that cells constituting the high grade malignancy are more easily affected by small doses of the extract than the cells constituting the low grade malignancy, even though larger doses are given.

LIPOID METABOLISM IN RELATION TO MALIGNANT GROWTHS

Evidence has been presented which caused us to believe that there might be some relationship between the sterol or lipoid metabolism and malignant growths. Together with the loss of weight, loss of appetite, general run-down condition and acidosis, associated with all malignancies, we found there was an increase in the amount of cholesterol in the circulation of the blood. It has been shown by other investigators that there is a definite link between the adrenal gland and the action of cholesterol in the body, and that the adrenal gland acts as a storehouse for the cholesterol esters. A line of investigation was then instituted to determine the effect of the extract on the blood cholesterol of normal animals.

Rabbits were selected for this particular experiment and it was found that our extract caused a fall of the total blood cholesterol of about 12 per cent, while the maximum drop was reached about sixteen hours after the injection of the extract.

This observation was considered of great importance, in view of the work of Cook of the Cancer Free Hospital in London, particularly due to the fact that deoxycholic and cholic acid, both by-products of cholesterol, under laboratory conditions comparable to the metabolic processes of the human body are transformed into methylcholanthrene, which is considered the most potent carcinogenic agent we have.

IMPORTANCE OF THE INDIRECT CONTROL OF CARCINOGENIC SUBSTANCE OUTPUT BY SUPRARENAL CORTEX PRINCIPLES

The proof of the indirect control of the output of this carcinogenic substance by the stabilizing or governing chemical action of the suprarenal cortex—no doubt, in concert with other pertinent endocrines—will furnish the connecting link in the explanation of the cause of malignancy; thus substantiating our original hypothesis that cancer is constitutional.

BEARD'S BIOCHEMICAL STUDIES OF AUTHORS' AQUEOUS EXTRACTS OF THE SUPRARENAL GLAND

Beard, of the Louisiana State University, in his biochemical study and analysis of our extract, has isolated a compound in crystalline form, which work will be reported and published at an early date.

INFLUENCE OF CORTICAL SUBSTANCE EXTRACT ON ADDISON'S DISEASE

We have also produced in our laboratories another potent aqueous extract from the cortical substance, which has been demonstrated in cases of Addison's disease, at the Southern Pacific General Hospital. This extract differs from our original extract, and its bioassay shows it to be more potent than any comparable extract now in use, for treatment of Addison's disease.

Our aqueous extract is not used in Addison's disease or other allied diseases.

EXTRACTS OF OTHER INVESTIGATORS

The extract formerly used by Pfiffner and Swingle and other research workers, as you will recall, was *not* an aqueous extract, but lipoid soluble, and has been changed by them to an aqueous extract, subsequent to the publication of our research work on the development of our aqueous extract.

IMPORTANCE OF CAREFUL pH CONTROL IN MAKING SUPRARENAL EXTRACTS

Explaining the different potencies of the various extracts, reports of which have been published from time to time in scientific journals, as Beard, our biochemist, has pointed out, a very important fact should be recognized, namely, the very careful control of the hydrogen ion concentration, or the pH at all stages during the extraction and preparation of the final product.

STUDIES ON TRANSPLANTED TUMORS IN RAREFIED ATMOSPHERES

In the light of the work of Warburg of Berlin and Sundstrom of the University of California, in their studies on transplanted tumors in rarefied artificial atmospheres, comparable to those of 25,000 to 30,000 feet altitude, we are carrying on experiments in atmospheres under pressure, in apparatus designed by us, in an effort to produce a deficiency or an imbalance in the endocrine system by keeping rats in different increased atmospheric pressures, endeavoring to produce spontaneous malignancies by means of noncarcinogenic irritants. A report of this study will be given later.

VITAMINS AS ETIOLOGIC FACTORS IN MALIGNANCIES

No evidence has been obtained that the known vitamins, with one possible exception, have any definite relationship to the cause of malignancy. It is a recognized fact, according to the work of Szent Gyorgi, that vitamin C, or hexuronic acid, is found in the cortex of the suprarenal gland. Our biochemist has been unable to isolate hexuronic acid, during the process of preparing our extract, due to the fact that hexuronic acid oxidizes very easily, and is lost in the steps of the heating process required in the first part of our method for making our extract.

Schröder of Munich has demonstrated that in malignancy the hexuronic content is found to be low, and it is also found that the suprarenal cortex is the richest center of vitamin C in the human body. The pituitary also is rich in vitamin C.

A method was devised in our laboratory for using hexuronic acid in conjunction with our extract, supracorcin, in cases of malignancy, giving doses as high as three hundred milligrams per day to an individual case. Data collected to date from these cases do not show any conclusive change which could be attributed to the administration of the hexuronic acid, or vitamin C, given in addition to our extract. We are continuing its use in further research.

USE OF SUPRARENAL EXTRACTS, TO AID OTHERWISE HOPELESS CASES, IN ORDER TO MAKE THEM MORE AMENABLE TO SURGICAL PROCEDURES

Certain types of these patients previously considered poor surgical risks have been brought back to surgery by the use of our aqueous extract. As early as 1930, we observed the striking effect our extract had in preventing surgical shock, in the group of patients to whom we were giving surgical assistance, even though the operative procedure was prolonged. It was generally noted that these patients recovered from operative procedures, (such as those in which the Percy cautery was used,) much better than patients undergoing routine surgical work.

These types of cases, such as "frozen" pelvis or broken-down breasts, can frequently be brought back for successful surgical interference by the use of the extract and especially when the surgery is done with Percy cautery. This is particularly true in the far advanced patients with breast cancer.

These are the sufferers where skin flaps cannot be hopefully striven for—indeed the final results are better without them. Following the Percy technique, we have remarkably rapid granulation of the operated area, free drainage, and the lack of metastases, especially in the skin with its certain closing of the lymphatic channels.

We are convinced that the pre- and postoperative employment of the extract, as said before, prevent possible shock following extensive cautery removal of the malignant soft tissues, especially if the adrenals should become affected as they sometimes are following sunstroke.

We likewise observed in these squamous and basal cell malignancies of the skin, that the use of the extract with the cautery results in quicker healing than the use of either separately.

From our experience with these far-advanced breast cases, we are of the belief that Percy's teaching that flaps in breast amputations encourage the redevelopment of the cancer cells that are sheltered by them is correct. This is particularly true in the Halstead type of operation where the flaps furnish ideal conditions for the further culture of the malignant cells that may be left, furnishing pabulum, shelter, moisture, rest and temperature.

With the lymphatics destroyed by the cautery heat, we have not observed recurrences or metastases through what otherwise would be open lymphatic channels. In addition, since we have followed the Percy method as outlined above, we have had no recurrences in or on the cauterized surfaces.

INFLUENCE OF SUPRARENAL EXTRACTS ON TISSUE REGENERATION

Patients were sent to our clinics with a surgical, or surgical and x-ray diagnosis of gastrointestinal malignancy, but without biopsies, and were classified as ulcer or nonmalignant cases. Many of them were not amenable to dietetic treatment or operative procedure; hence, they were given our extract and the major portion of these cases showed improvement when x-rays were taken, from three to six months later, demonstrating that our extract was apparently exercising its efficacy to regenerate tissue.

OBSERVATIONS OF INFLUENCE OF SUPRARENAL EXTRACT ON SPECIAL SYMPTOMS AND SIGNS

We have observed that, with the use of our extract, the feeling of languidness and fatigue, particularly with cancer patients who belong to the aged or prematurely aged, is greatly improved.

Many malignant cases have a cachexia due to anemia, probably resulting from the absorption of toxins. The extract produces, in a majority of these patients, a disappearance of this anemia with cachexia.

We have demonstrated that liver extract will not affect the anemia of malignant cases, but rather under this therapy the anemia is increased.

We might call your attention to other symptomatic observations in these advanced patients, such as gain in weight, improvement of blood picture, and the feeling of general well-being. There is no doubt the morale of the patients and the feeling of well-being are greatly improved.

With the improvement of appetite and eating, naturally weight increases, as evidenced by the following table:

EFFECT ON WEIGHT

Net gain in weight	48.7 per cent
Net loss in weight	29.5 per cent
No change in weight	21.7 per cent

The following table, compiled from the data obtained from the charts of cases in our clinics, gives an accurate percentage as to the sense of general well-being experienced by the patients:

EFFECT ON SENSE OF WELL-BEING

Improved	75.5 per cent
Worse	12.02 per cent
No change in well-being	12.3 per cent
Doubtful as to change	.06 per cent

In some cases of blood pressure, the extract acted as a stabilizer, probably not *per se*. The action of the cortex is a vasodilator, and the medulla, a vasoconstrictor. This may explain why, in many instances, there is relief of pain in these malignant cases, as evidenced by the following table:

EFFECT ON PAIN

Pain greatly or entirely relieved	65.3 per cent
Never had any pain	12.07 per cent
Pain not relieved	21.05 per cent
Doubtful regarding relief of pain	13.02 per cent

Most of you are familiar with the disagreeable odor which accompanies a large majority of cases of inoperable carcinoma. After a few months' use of the extract, it was observed that this odor often disappeared. It was likewise observed, by rela-

Table 1.—*Class 1—Deceased Patients*

	Number of Patients
Group 1.—Patients who lived three months but less than one year	640
Group 2.—Patients who lived one year but less than two years	292

Group 4.—Patients who lived three years but less than four years	37
Group 5.—Patients who lived four years but less than five years	19
Group 6.—Patients who lived five years but less than six years	1
Total	1,094

tives of patients, and commented upon by them, that the characteristic repulsive odor disappeared with the use of the extract.

TYPE OF PATIENTS TREATED IN AUTHORS' CLINICS

We wish to emphasize that all patients received in our clinics in the past five years have been hopeless cases, presenting, at the time of admission to the clinics, letters from physicians, stating that all accepted methods of treatment had been used without avail, and that the prognosis was considered hopeless with present usage.

AUTHORS' FIVE YEARS' STUDIES AND GESCHICKTER CRITERIA

In making our tabulations for this five-year clinical research effort to comply with the Geschickter criteria, in studying the value of our extract, we have advisedly and definitely eliminated from our statistics, as to final results, all patients who did not receive the benefit of at least thirty injections, for the obvious reason that they were moribund at the time of arrival at our clinics, and a large percentage of these terminal cases died with intercurrent diseases.

ACTION OF SUPRARENAL EXTRACT ON MALIGNANCIES PREVIOUSLY TREATED BY ROENTGEN THERAPY

We have studied the influence of the roentgen rays upon the adrenal gland, and have observed,

as shown by tabulations, that where the roentgen rays had been used, the potency of the extract was greatly lessened.

We wish to repeat that our experimental research effort has been upon only hopeless and dying people. The research effort of our theoretical views, as originally expounded in our report of September, 1930, can be demonstrated by these tabulations and a review of our clinical charts.

PRESENT CANCER MORTALITY FIGURES AND CURE PERCENTAGES, WHEN ALL TYPES OF CASES ARE INCLUDED

The reports made by other investigators and cancer research clinics show that cancer can be

cured only when taken early. Statistics compiled by leading investigators show that there are now somewhere between 120,000 and 150,000 deaths yearly. With these tragic figures before us, if we are looking for results from five years' treatment of all types of cases, early and late, we cannot avoid growing pessimistic regarding the efficacy of present usage.

DR. JAMES EWING'S REPORT TO THE 1933 INTERNATIONAL CONGRESS ON CANCER

James Ewing, one of the outstanding cancer pathologists living today, in his report before the International Congress of Cancer, held in Madrid, 1933, as quoted in its proceedings, said in his conclusion:

"The present rate of cure varies widely in different types of the disease, but it is probably safe to estimate that not more than 5 per cent of the cancer cases live more than five years, while with the major forms of the disease the eventual mortality runs between 95 and 100 per cent.

"There is no reasonable ground whatever for assuming that any new curative agent or method will be found in the near future which will alter these conditions."

In the light of Doctor Ewing's opinion, just quoted, we feel hopeful in presenting these tables and statistics, compiled, not from early cases where the opportunities to benefit the patients are immeasurably greater, but from the hopeless cases that have been treated in our clinics during the past five years.

AUTHORS' RESULTS IN HOPELESS CASES, AS NOTED IN FIVE-YEAR SURVEY

At the end of five years of painstaking work under the most trying conditions, confined exclusively to hopeless cancer patients, and having studiously complied with the requirements of the Geschickter criteria, we are greatly encouraged, and the data compiled from our records, as you will see, seem to warrant us in stating that our aqueous extract, to which we have given the name, supracorcin, has benefited as large or a larger percentage of hopeless cases as any other treatment known to us.

OBSERVATIONS OF LIVING PATIENTS AND THEIR CLINICAL RECORDS

We feel it is of essential importance to substantiate our clinical data with living evidence. In our clinic in the Medical Building, 909 Hyde Street, just across the street from the St. Francis Hospital, we have assembled from California and adjacent states, representative cases of different types of cancer referred to in this paper. Many of these patients will verify that they were admitted to our clinics over five years ago.

TABLE 12.—*Class 2—Inactive (untraced)—Group 6—More than five years have elapsed since the patients in this group, all of whom were living when last heard from, were admitted to the clinics. Method of diagnosis, metastases, location, type and sex; fifty cases.*

You are cordially invited and urged to step across the street, after the presentation of the clinical data, which will follow, and see these patients, talk with them, examine them, inspect their clinical records, and evaluate fully, for yourselves, the validity of the data which we have briefly outlined.

Doctor MacNevin, Director of the San Francisco Clinic, will give you every assistance during your observation of these patients.

* * *

PART II

ANALYSIS OF CLINICAL MATERIAL: WITH THIRTY-FOUR TABLES

* * *

GROUP CLASSIFICATION OF PATIENTS INCLUDED IN REPORT

The patients who have been registered in our clinics in the last five years, first, have been segregated into different classes relative to the length of time they were members and then receiving extract or being under our care, having returned home to have the extract administered to them by their own physicians, who are coöperating with us; second, those patients who have been members of our clinics and have discontinued the use of the extract; and third, those patients who have died. Five hundred and forty-eight patients presented themselves to the clinics, applying for admission, but were not admitted because of the lack of fulfillment of the requirements.

TOTAL NUMBER PATIENTS ADMITTED TO CLINICS: MINIMUM NUMBER OF TREATMENTS NECESSARY TO OBTAIN RESULTS

Since the organization of the Coffey-Humber clinics in February, 1930, 7,513 patients, suffering from malignancy of some form, have been registered for treatment. Each one of these cases fulfilled all the requirements for admission.

As has already been brought out, it has been considered necessary for patients to receive at least thirty injections of the extract before any definite or beneficial results can be expected, other than the relief of pain in many cases, after only a few injections.

SPECIAL GROUP OF PATIENTS WITH MALIGNANCIES SO FAR ADVANCED AS TO MAKE IMPOSSIBLE MINIMUM TREATMENTS REQUIRED

For this reason, those patients having been admitted to our clinics in such a critical condition

Table 14.—*Class 3—Active—Group 2—More than one year has elapsed, but less than two years, since the patients in this group, all of whom are receiving treatment at present, were admitted to the clinics. Method of diagnosis, metastases, location, type and sex; sixteen cases.*

Number	Male	Female	Type	Location	Metastases Yes	Metastases No	Diagnosis Biopsy	Diagnosis X-Ray	Diagnosis Surg.
5	..	5	Adenocarcinoma	Breast	3	2	3	..	5
1	1	..	Carcinoma	Glands (retroperitoneal)—metastatic	1	..	1	..	1
1	1	..	Epidermoid carcinoma	Nose	..	1	1	..	..
1	..	1	Adenocarcinoma	Ovary	..	1	1	..	..
3	3	..	Adenocarcinoma	Prostate	..	3	3	..	2
1	1	..	Adenocarcinoma	Rectum	..	1	1	..	1
2	2	..	Adenocarcinoma	Stomach	..	2	1	1	1
1	1	..	Teratoma	Testicle	..	1	1	..	1
1	1	..	Hodgkin's disease	....	..	1	1	..	..

are considered in a special group. In this group of 3,782 patients are placed all those whose condition was so far advanced that they succumbed from the malignancy from which they were suffering or from intercurrent diseases in spite of all our efforts to prolong life a sufficient length of time to allow them to receive at least thirty injections of the extract.

PREVIOUS X-RAY THERAPY IN THIS GROUP: RELIEF OF PAIN FROM USE OF EXTRACT

Naturally, according to our theory, if a deficiency of the adrenal cortices is further increased

by a destructive influence of the roentgen rays, the likelihood of an early effect of this extract upon these patients will be greatly lessened, and the possibility of their succumbing either from a malignancy or from intercurrent diseases would also be increased.

The one beneficial result which we feel sure was obtained in this group of cases was the relief of pain, thus making the last days of life more comfortable for these poor unfortunates.

CLASSIFICATION OF PATIENTS RECEIVING MORE THAN THIRTY TREATMENTS

Those patients who were admitted to the clinics who received over thirty injections have been segregated into three classes, with the exception of those falling into special classes, such as prophylactic and ulcer cases. These three classes (deceased, inactive—traced and untraced—and active) were again divided into six groups, ac-

TABLE 21.—*Class 4—Prophylactic—Active—This table is composed of patients having had the primary area of involvement totally removed, and, at the time of admission to the clinics, showing no evidence of metastases or recurrence. These patients at the time of compiling this report are still receiving extract (supracorcin) and are still free from any clinical evidence of malignancy. Twenty cases.*

cording to the number of years they lived since being admitted to the clinics.

CLASS I. ON PATIENTS WHO DIED

This class includes those patients who expired after receiving more than thirty injections.

Although these deceased patients are counted as a whole in our malignant group, many of them died with intercurrent diseases, as previously stated. (See Table 1.)

CLASS II. ON PATIENTS WHO DISCONTINUED TREATMENT: SUBGROUPS OF TRACED AND UNTRACED PATIENTS

This group consists of patients who voluntarily discontinued the use of the extract after receiving more than thirty injections. One of the most difficult problems has been to cause the patients to realize that they should continue the use of the extract. It has not been possible to determine how much influence the extract has had upon regenerating the cortical cells and restoring their normal function, although there have been enough patients who have been cleared of malignancy, discontinued the extract, and had recurrence, to establish to a fair degree of certainty that, in these cases, the function of the adrenal cortex has been sufficiently impaired to cause the return of the malignancy, when such a deficiency of the active principle is not supplied therapeutically.

On the other hand, in other patients, it is very probable that the function of the adrenal cortex is not impaired sufficiently to create a deficiency great enough to cause a recurrence unless some added insult to the tissue, such as irritation or trauma, occurs. Many of these patients have received a sufficient amount of the extract to make up for the deficiency and are able to carry on without any change one way or the other.

For this reason, we have been unable to state positively to these patients that they will have a recurrence if they discontinue the use of the extract. Therefore, many patients, because of great improvement in their malignancy, and their general well-being and relief of pain, et cetera, have felt they could afford to discontinue taking the extract for at least a while, and have become inactive in the clinics.

One of the greatest problems of the record department of the clinics has

TABLE 22.—*Class 5—Ulcer.—This table includes those patients diagnosed by x-ray as having definite ulcers, and those diagnosed as having malignancies of the stomach, although there was some question, at one time or another, in the histories, as to whether or not the existing condition was an ulcer. Chart 1.—Age incidence of malignancy in 2,425 patients (male).

been the following up or tracing of these patients who have discontinued; and, although the work has been diligently carried on, there is a large group of patients that has not been heard from for some time, although, when information was last obtained from them, they were living, many of them still clear of any evidence of malignancy, others working, but still showing definite evidence of malignancy, and others in the same condition as when they left the clinics. For this reason, the groups in the discontinued class have been divided into traced and untraced. Those in the traced group include those patients as of February 1 or any later date, when they may have been heard from. (See tables 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12.)

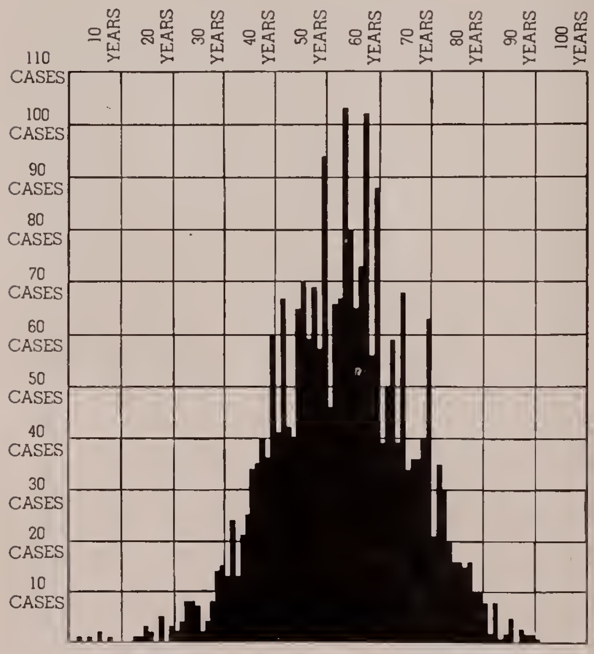

Chart 3.—Age incidence of malignancy in 3,121 patients (female).

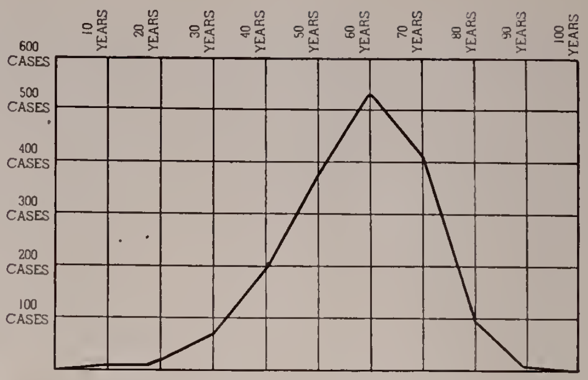

Chart 2.—Age incidence of malignancy in 2,425 patients (male).

CLASS III. ON PATIENTS STILL UNDER TREATMENT: IN CLINICS OR IN THEIR HOMES

This class consists entirely of patients who have continually received the extract since entering the clinics, although some of this number are receiving the extract at home from their own physicians who are coöperating with us in this research work. (See tables 13, 14, 15, 16, 17, and 18.)

CLASS IV. ON PATIENTS PREVIOUSLY TREATED BY SURGICAL METHODS: RECEIVING LATER TREATMENT WITH SUPRARENAL EXTRACT, FOR PROPHYLACTIC PURPOSES

This class is composed of those patients who have had positive diagnosis of malignancy by biopsy with surgical intervention and total removal of the malignancy, and are receiving treatment as a prophylactic measure against recurrence.

In this class are patients with early malignancy of the breast, evidenced in many instances only by a small malignant nodule, and where complete radical operation by surgical measures has been performed.

It is interesting, also, to note in this class, the number of breast cases that had metastatic involvement of the axillary glands at the time of radical surgery. (See tables 19, 20, and 21.)

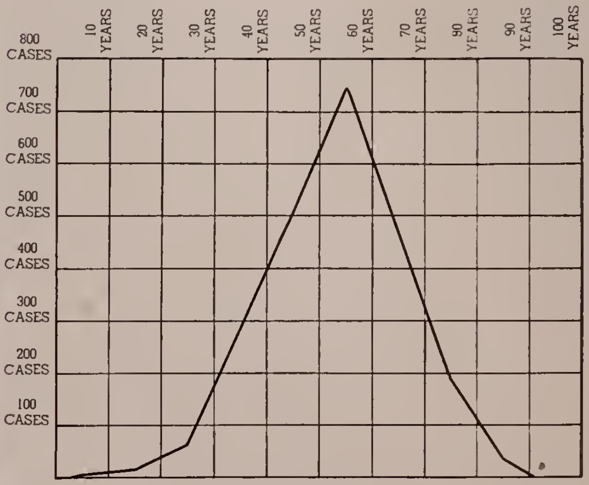

Chart 4.—Age incidence of malignancy in 3,121 patients (female).

90 to 95 years	3	3	6
95 to 100 years	1	..	1

Average age: 41.4 years.

CLASS V. ON PATIENTS WITH GASTRIC ULCERS AND MALIGNANCIES

This class includes those patients who were diagnosed as having gastric cancers, and others who were diagnosed as having ulcers not amenable to treatment. The table includes those cases diagnosed by x-ray as definite ulcers and those diagnosed as malignancies of the stomach, although there was some question, at one time or another, in the histories, as to whether or not an existing condition was an ulcer or a cancer.

TABLE 24.—*Metastases in Carcinoma of the Breast—Anatomical Distribution in 505 Patients**

	Number of Cases	Per Cent
Metastases from breast to lungs	125	25.0
Metastases from breast to ribs, sternum, manubrium	54	10.8
Metastases from breast to vertebrae	37	7.4
Metastases from breast to pelvic bones	31	6.2
Metastases from breast to long bones	28	5.6
Metastases from breast to axillary glands	301	60.2
Metastases from breast to clavicular glands	100	20.0
Metastases from breast to cervical glands	51	10.2
Metastases from breast to opposite breast	55	11.0

* The majority of patients had multiple metatases and, therefore, appear in one or more groups. Twenty patients with metastases from the breast to other locations, mostly visceral, are not included.

TABLE 25.—*Summary of Data Regarding Metastases in All Classes: 1,506 Cases*

	Metastases	
	Yes	No
Class 1.—Deceased	575	519
Class 2.—Inactive (traced and untraced)	106	169
Class 3.—Active (receiving extract at the present time)	52	85
Total	733	773

TABLE 26.—*Surgical Treatment Prior to Admission to the Clinics; Series of 1,506 Cases*

	Number of Patients Who Had Received Surgical Treatment
Class 1.—Deceased	702
Class 2.—Inactive (traced and untraced)	189
Class 3.—Active (receiving extract at the present time)	98
Total	989

One patient reported in this class will illustrate our reason for making this special classification. The patient in question was a man (case number 774), who was diagnosed by surgery in 1928 as having an ulcer of the stomach; in 1931 a diagnosis of probable carcinoma was made by the Veterans Bureau of the United States Army; and in 1931, x-rays of the lung were reported as showing metastatic growth in the lung. Even in view of the fact that there was an x-ray diagnosis in this case, it is still left in the ulcer group.

	Number of Patients Who Had Received Radium Therapy
Class 1.—Deceased	215
Class 2.—Inactive (traced and untraced)	72
Class 3.—Active (receiving extract at the present time)	28
Total	315

Another patient in this group, a woman (case number 785), diagnosed by x-ray as having ulcer of the duodenum in 1933, in one of the well-known hospitals of the United States, had failed to respond to medical treatment over a period of six months. She was then placed upon the extract and the ulcer symptoms disappeared after three months' treatment. Later she developed

symptoms which indicated a cholecystitis, but in view of her previous ulcer history, the question arose as to whether or not it was a return of her ulcer. An x-ray examination failed to reveal any definite ulcer. An exploratory operation was done and an inflamed gall-bladder was found, which was removed. The scar of an old healed ulcerated area was also found. (See Table 22.)

SUPRARENAL GLAND STRUCTURE AND FUNCTION IN DIFFERENT AGE PERIODS: IN RELATION TO MALIGNANCIES

The question of age is a very important one in many respects, when considering the problem of the cause of malignancy. Embryologically, cortical cells of the adrenal glands develop much earlier than the medullary cells, and, as far as we can determine, are very active at birth. The adrenal glands develop and remain active, to all intents and purposes, during the early portion of an individual's life, and it is only after forty years or more that atrophy of the cortices of the adrenals is found. Very rarely do we find atrophy of the adrenal cortices in children or individuals before they have reached middle age. As the individual approaches middle age, the incidence of cancer increases and naturally with our theory, we assume that, as an individual grows older, the atrophy increases, with a subsequent dysfunction of the adrenal cortices. With the increase in this dysfunction, less of this active principle, or stabilizer of tissue growth, is produced and given to the system. Therefore, we assume that the chances of developing a malignancy are increased because of the lack of this protective agent. (See Table 23, and charts 1, 2, 3, and 4.)

In passing, a note can be made of a press dispatch which may be of interest even though no means of confirming its truth is at hand. It was to the effect that in Greece, in a little village near Athens, the inhabitants use the entrails of sheep mixed with their food. There was no record of any death or case of cancer in this village. The supposition is that they were protected by a hormone, from the entrails of sheep, which produces an immunity.

METASTASIS IN MALIGNANCIES

Metastasis is a transfer of the malignancy to, or a secondary involvement of, a portion of the body foreign to the original area of involvement. It has been of particular interest to note the metastases which have taken place from the breast to the bone and from the breast to the lungs.

The table on metastases which is being shown is a summary of a detailed table which time will not permit us to show. (See Table 24.)

Table 25 gives a summary relative to whether or not metastasis was present in all patients who entered the clinics and received over thirty injections.

The following observation is worth mentioning, as this type of case is rare and only one was found in our entire 7,513 cases. The particular case in question was diagnosed hypernephroma of the thyroid gland, metastatic.

ON 989 CANCER PATIENTS, PREVIOUSLY TREATED BY SURGICAL METHODS

Table 26 gives a summary of patients in all classes (a series of 1,506 cases), in which group, 989 patients received surgical treatment prior to admission to the clinics.

ON 315 CANCER PATIENTS, PREVIOUSLY TREATED BY RADIUM THERAPY

The use of radium in malignancies is of particular interest, especially in certain types of cases. Table 27 gives a summary in a series of 1,506 patients, in which group, prior to admission to the clinics, 315 patients received radium therapy.

ON 485 CANCER PATIENTS, PREVIOUSLY TREATED BY ROENTGEN THERAPY

The influence of x-ray therapy upon these patients prior to their admission to the clinics, and its relation to the action of the extract, were considered important. Whether or not the roentgen rays have a definite destructive influence upon the adrenal cortices which would consequently cause a deficiency in the output of the adrenal extract could only be determined, if at all, we felt, by data compiled from those patients having received x-ray treatment, together with information obtained in the work on sheep, as previously related.

The beneficial action of x-ray in the treatment of malignancies must also be taken into consideration. (See Table 28.)

ON RECURRENCES OF MALIGNANCIES, AFTER PRESUMABLE ROENTGEN RAY THERAPY

The influence of postoperative x-ray upon recurrence is another factor which should be taken into consideration. Recurrence, in the strictest sense of the word, means where there has been total eradication of the malignancy, and a second appearance of the malignancy, at the site of operation. (See Table 29.)

ON EFFECTS OF SUPRARENAL EXTRACT ON PAIN, WEIGHT AND FEELING OF WELL-BEING

It has been gratifying to note the increase in weight, relief of pain and general improvement in well-being in these patients. Our observations regarding these facts have been consistent during the past five years, as will be evidenced by the following tables. (See tables 30, 31, and 32.)

PERCENTAGE OF CLINICALLY CLEAR PATIENTS AT END OF FIVE YEARS

Since the reading of this paper, two more patients in the "untraced" five-year group have been heard from, which will place them in the "traced," or clinically clear, five-year group, changing the total number of patients (see Table 33) in the traced or in the clinic group from 108 to 110, and the percentage from 10.38 per cent to 10.57 per cent. This also changes the number of patients of the five-year clinically clear group from 52 to 54 cases and the percentage from 5 per cent to 5.1 per cent.

FINAL SUMMARY OF PATIENTS UNDER TREATMENT FOR FIVE YEARS: (1) OF PATIENTS STILL LIVING AT END OF FIVE YEARS; AND (2) OF PATIENTS STILL LIVING AND CLEAR OF CLINICAL MANIFESTATIONS OF CANCER

The viewpoints of the authors concerning the constitutional nature of cancer are outlined.

Authors' reasons for believing that an aqueous

TABLE 34.—*Summary for Patients Who Started Treatment in 1930*

Total number of patients in Classes 1, 2, 3..............1,040

	Number of Patients	Per Cent
Total number of patients living five years after being admitted to the clinics..................	110	10.57
Total number of patients living five years after being admitted to the clinics, who are clinically clear..............................	54	5.1

solution of the cortex of the suprarenal glands (supracorcin), made according to their method, as being of value as a therapeutic agent in the treatment of cancer, are indicated.

Observations on a total of 8,061 patients suffering from terminal or inoperable cancer, who applied for treatment during the last five years, are given.

The results obtained in the treatment of 1,040 patients suffering from advanced cancer, who were referred by attending physicians to the authors' clinics, and each of whom received at least thirty treatments with the aqueous extract of the cortex of the suprarenal gland, are presented.

IN CONCLUSION

In California and Western Medicine (September, 1930, page 640) was printed the paper read by the authors, on August 23, 1930, before the Pacific Association of Railway Surgeons; that paper being partly based on the subject matter presented previously, on January 6, 1930, to the San Francisco Pathological Society.

Since 1930, five years have elapsed (the time period set in the Geschickter criteria as being necessary before conclusions could be properly drawn as to value of therapeutic methods intended to alleviate cancer).

In the two clinics maintained by the authors, at San Francisco and Los Angeles, a total of 8,061 patients with advanced cancer applied for registration and treatment; 548 of these not being registered, because they failed to comply with the requirements.

The great majority of these patients were referred to the clinics by their attending physicians of California and other states, and in each instance an earnest endeavor was made to use all methods necessary for accurate diagnosis. Clinical histories, by both the attending physicians previously in charge and of the clinics, were carefully kept, and are in the files, in well tabulated and easily accessible form, for inspection by responsible parties.*

In a total of 1,040 patients, each of whom received thirty or more injections with the authors' aqueous extract, there were 108 patients or 10.38 per cent, who are still living at the end of five years; and of this latter number, 52 patients, or 5 per cent, are clinically clear of cancer involvement at the end of five years.

(Note.—Since writing this paper, the four-year group referred to in Table 33, has become a five-year group; and of this group, consisting of 236 patients, 45 patients, or 19.6 per cent, are living. The checks on clinical clearness have not yet been completed for this group.)

Table 33 shows, year by year, a decreasing number of patients who have received at least thirty treatments with the authors' aqueous solution. This is due to the fact that very few hopelessly advanced patients are now being sent to the clinics, and also because the extract is now being furnished to licensed physicians of the Union; so that at the time of this writing, otherwise inoperable cancer patients (clinical histories having been previously transmitted to us by their medical attendants) are now being treated in thirty-six different states by their licensed physicians, with aqueous extract supplied by the authors.

Dr. James Ewing, of the Cancer Memorial Hospital of New York, in his report to the International Congress of Cancer, held in Madrid, 1933, as quoted elsewhere, declared that "it is probably safe to state that not more than 5 per cent of the cancer cases live more than five years."

In the light of Doctor Ewing's statement, it should be of interest to note that, in the analysis of the authors' total of 1,040 patients with inoperable cancer, and under observation for five years, a total of 108 patients, or 10.38 per cent, are living at the end of five years. (Since the above report was read at the St. Francis Hospital meeting of the American College of Surgeons session, in San Francisco, October 28 to November 1, 1935, two patients, still living, who are in this five-year group, have reported, making the total of living patients in this first five-year group 110, a percentage of 10.57 per cent of living patients, of which number 54, or 5.1 per cent are clear of symptoms.)

As previously stated, the complete clinical records of all patients under observation in the last five years are open to inspection and study by responsible parties.†

The authors submit that their studies, with the results obtained during the last five years, compare favorably with any in the literature; especially since they are based on observations of results in the massive amount of clinical material of advanced type that was under observation. It is needless to add that they are encouraged to go forward with their work.

Coffey-Humber Clinic, 909 Hyde Street.

---

* Concerning the manner in which the records have been kept in the clinics, it may be permissible to quote from a letter received from Frederick L. Hoffman, well-known authority on vital statistics, long connected with the Prudential Insurance Company in New York, and in later years with the Cancer Library and Cancer Research Fund of the University of Pennsylvania, Graduate School of Medicine, Medico-Chirurgical College, who wrote:

"The condition of your records is so admirable that I feel more than ever a full analysis of your experience would make an extremely valuable contribution to cancer knowledge. My daughter gets through with our study of the cases at the Huntington Memorial Hospital some time in March, and I have been wondering if you could not employ her for two or three months to abstract the essential facts of your records to enable me to present a full analysis of your experience from the beginning to date. I know of no records kept in such admirable condition as yours or any that would justify a more thorough study in view of the apparently exceedingly satisfactory results in otherwise hopeless cases."

† At the time this paper was read at the St. Francis Hospital meeting of the session of the American College of Surgeons held in San Francisco on October 28 to November 1, 1935, it was possible to bring from California and adjacent states a total of twenty-five patients still living at the end of five years, and clinically clear of symptoms of cancer; and to present these patients, with others not so fortunate, in the clinic rooms, for examination by attending physicians and surgeons who were present at the reading of the paper.

THE PATHOLOGY OF SUDDEN OPERATIVE DEATH*

By Paul Michael, M.D.
Oakland

Discussion *by Paul H. Guttman, M.D., Sacramento; A. M. Moody, M.D., San Francisco; Jesse L. Carr, M.D., San Francisco.*

The occasion of sudden operative death is, fortunately, a rare event in the course of surgical practice. The pathologist, situated as he is, may better be able to form a disinterested and unemotional opinion toward the solution of this problem when it occurs. Although a great deal of effort has been expended of late in evaluating the various factors, there is still much to learn before the final solution is reached.

The object of this paper is to endeavor to answer the following question: "What is it that happens to a patient appearing in relatively good health, with a normal blood pressure, normal heart action and no apparent pathologic derangement in the cardiac or respiratory systems, that causes a cataclysmic exitus on the operating table?" In answering the question, the scope of this paper must be qualified to include only those deaths occurring in the course of a general anesthesia involving the use of nitrous oxid and oxygen, ether, or both.

CAUSES OF SUDDEN OPERATIVE DEATHS

The following enumerated causes explain the great majority of deaths on the operating table:

1. Poor physical condition of the patient.
2. Improper technique in the administration of the anesthetic.
3. Impurities present in the anesthetic used.
4. Extreme loss of blood during the operation.
5. Asphyxiation.
6. Intracranial hemorrhage.
7. Acute hemorrhagic pancreatitis or hemorrhage into the pancreas.
8. Hemorrhage into the adrenals.
9. Coronary occlusion.
10. Embolism.
11. Fatal stimulation of the carotid sinus.
12. Persistent thymus or status lymphaticus.

Here we have twelve possible causes of death occurring in the course of an operation under a general anesthesia. Seven out of the twelve will commonly give us some organic characteristic picture at autopsy upon which we may make a diagnosis. These are: asphyxiation, embolism, intracranial hemorrhage, pancreatic hemorrhage, adrenal hemorrhage, coronary occlusion, and status lymphaticus or persistent thymus. In the remaining five the pathologist may be at a loss in making an anatomical diagnosis as to the cause of death.

The causes of poor physical condition of the patient are legion, and naturally cannot be enumerated. Such deaths may be the result of improper judgment or incorrect diagnosis, and should not be classed as due to the anesthesia. In this latter group we must remember that a death occurring during an abdominal laparotomy, when a coronary occlusion was present, cannot be attributed to the anesthetic alone.

COMMENT ON CAUSES OF SUDDEN OPERATIVE DEATHS

The following causes of death deserve a more detailed description of the anatomical findings and the causes ascribed to them:

1. *Asphyxiation.* — With rare exception, no matter the cause of asphyxiation, we have the following anatomical characteristics: cardiac dilatation, small petechial punctate hemorrhages over the visceral pleura and visceral pericardium, deeply bluish, red lungs showing marked edema and congestion, bilaterally and symmetrically scattered petechial hemorrhages in the basal ganglia.

2. *Intracranial Hemorrhage.*—Cerebral hemorrhage is not confined only to elderly people. We may also encounter it in younger patients, particularly in luetics and the thymic-constitutioned. The middle cerebral artery is the one principally involved, although hemorrhage of any of the Circle of Willis vessels may occur, with medullary pressure resulting. It must also be kept in mind that sudden death has been reported due to rupture of an aneurysm present within the cranial cavity.

3. *Hemorrhage Into the Pancreas.*—Acute hemorrhagic pancreatitis has been reported occurring during general anesthesia. None of the reported cases showed any symptoms referable to the pancreas prior to the anesthesia. The probable explanation of this is that duodenal contents, or irritating bile, regurgitates back into the pancreas. The pancreatic ferments then produce rapid destruction of the organ, causing death by shock from split-protein products.[1]

4. *Hemorrhage Into the Adrenals.*—Unilateral or bilateral hemorrhage into the adrenals during general anesthesia is sometimes seen as a cause of death. The whole adrenal gland may be involved, but usually the most marked hemorrhage occurs in the medulla. The rôle of the anesthesia in this hemorrhage is not well defined. The anatomical findings of cardiac dilatation and acute pulmonary congestion are found.

5. *Coronary Occlusion.* — Coronary occlusion may account for as high as 20 per cent of sudden deaths occurring in adults undergoing operation.[2] This figure does not include those patients incorrectly subjected to an abdominal laparotomy when a coronary artery obstruction is already present. The findings in these cases show that occlusion may occur at any point in the coronary arterial tree, but especially in the descending branch of the left coronary vessel. Acute passive congestion of all organs, especially the lungs, is seen at autopsy.

6. *Embolism.* — Pulmonary embolism presupposes a previous thrombosis, either due to tumor invasion of the vessel wall or to some previous vascular damage. Pulmonary infarction, then, rarely occurs on the operating table, although it is not infrequently seen as a postoperative complication. There are two special types of embolism,

---

* Read before the Pathology and Bacteriology Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13-16, 1935.

however, which merit additional consideration, namely, fat embolism and air embolism.

Fat embolism: Fat embolism may be due to endogenous or exogenous fat being introduced into the circulation. Endogenous fat embolism from the body itself may occur, especially during trauma or operations on the long bones. There may be an abnormal destruction of fat cells in the bone marrow, tearing of the venules in the Haversian canals of the bones, or increased internal pressure in the region of a fracture which may favor entrance of fat into the blood stream.[3]

Iodized oil is now frequently used as an opaque substance to fill cavities and occasionally may enter the blood stream. Due to abnormal pressure during injection, pathologic permeability of vessels, or injury to any organ during the injection, a disseminated fat embolism may occur. The mechanism of fat embolism may be explained on the basis of a physicochemical phenomenon. There is an alteration in the state of the existing fat in the blood stream leading to the formation of an emulsion. This naturally exists as a foreign body and may result in occlusion of small capillaries.

Fat emboli may lodge in the lungs, resulting in pulmonary embolism. The fat, however, may reach the lungs and do but a minimum amount of damage there, being forced through the lung capillaries into the left side of the heart and into the systemic circulation. From this point on, any organ or tissue may be involved. The fat is usually disseminated throughout the organ or tissue in small droplets which may be demonstrated by osmic acid or other fat stains. A paradoxical embolism due to a patent foramen ovale may occur, and this possibility must always be borne in mind.

Air embolism: Although man is particularly immune to embolism from air, such an event sometimes is seen. Two main types of air embolism are encountered; first, when a large quantity of air is injected into the venous system. At autopsy, the right heart is markedly dilated and contains a large amount of frothy blood. Death in these cases is usually the result of a mechanical obstruction ending in fatal auricular or ventricular fibrillation. The second type of fatal air embolism is encountered when air is accidently introduced into any one of the pulmonary arteries. Death erroneously attributed to "pleural shock" may be explained on this latter basis. Columns of air may disseminate through the systemic circulation, especially the brain. Air in the smaller arteries and arterioles leads to slowing of the blood stream, causing prestasis and stasis. Diapedesis takes place, resulting in small hemorrhagic points, progressing to occlusion and perivascular hemorrhage. Chase has shown that conglutination occurs during prestasis; while agglutination follows permanent stasis.[4] At autopsy, in these cases the brain shows cerebral edema, hyperemia and perivascular hemorrhages that may be cortical, subcortical, meningeal, or in the basal ganglia.

7. *Fatal Stimulation of the Carotid Sinus.*—This is a cause of death which has, until recently, been somewhat overlooked. Although no definite pathologic picture exists postmortem, abnormal stimulation of this sinus must be kept in mind as a possible factor. Death by pressure on the vagus nerve is probably explained as carotid sinus stimulation. The carotid sinus is located just behind the angle of the jaws. This bulb is a dilatation of the root of the internal carotid, which is somewhat delineated from the rest of the carotid artery by having a thinner wall and possessing an investment of sensory end-organs. These are connected to the brain by a branch of the glossopharyngeal nerve. In health the carotid sinus is in a state of fairly constant tonus. This tone increases or diminishes with the varying arterial pressure within it. The carotid sinus is also sensitive to other stimuli, such as pressure on the wall, stimulation of its nerve, or certain drugs. Morphin particularly may increase its response, resulting in hypotension and slowing of the heart.

Believing that the carotid sinus may sometimes be stimulated by certain anesthetics, a group of workers at the University of Pennsylvania[5] have recently shown that inhalant anesthesias have a stimulating effect upon the sinus. Nitrous oxid was found to cause such a stimulation. These workers used dogs, and employed 80 per cent nitrous oxid with 20 per cent oxygen. They reported no serious effects until the anesthetic had lasted at least twenty minutes. After this period certain dogs showed a respiratory arrest and circulatory collapse, similar to that observed in humans on the operating table. They believed that there was a toxic action of nitrous oxid probably associated with some personal idiosyncrasy, as this effect could not be repeated in all dogs. They reported no characteristic postmortem picture observed, although acute congestive failure was seen in all animals studied. The practical conclusions drawn by them from this study were:

1. In anesthesia, pressure on the carotid sinus must be avoided.

2. Ether vapor with nitrous oxid tends to offset the reaction.

3. In operative accidents, drugs are useless, artificial respiration being the best procedure.

8. *Persistent Thymus or the Thymicolymphatic Constitution.*—In 1930, Young and Turnbull,[6] reporting for the English Status Lymphaticus Investigation Committee on over six hundred autopsies, questioned the existence of a thymic diathesis. This conclusion fails to explain the importance of status lymphaticus, as much as the diametrically opposite belief that all sudden death may be explained on this basis. Between these two extremes are the more conservative pathologists who believe that many cases of sudden death may be thus explained. Douglas Symmers[7] has defined the thymicolymphatic constitution as a "combination of hereditary constitutional anomalies entering into which are usually certain peculiarities of configuration, with preservation or even hyperplasia of the thymus at an age when involution is to be expected—hyperplasia of the lymphoid cells of the spleen, intestines, and elsewhere; changes in the hair, hypoplasia of the vascular system, sometimes with congenital hypoplasia in the geni-

talia." An idea as to the prevalence of such a condition may be found in the Bellevue Hospital statistics. In a series of 4,000 autopsies, status lymphaticus was found in 249 cases, or in 6.2 per cent of the postmortem examinations. It was observed six times more frequently in males than in females. There were two main anatomical types: a true status lymphaticus, where the lymphoid tissues were hyperplastic and flourishing, and the recessive status lymphaticus, where the lymphoid tissues were atrophic but present microscopically.

Early in the study of this condition, sudden death, especially in small infants, was attributed to a mechanical obstruction of the trachea by an enlarged thymus. Anatomically, we now know that this belief is incorrect, as associated characteristics of this constitution include anatomic factors which may be predispositions of sudden death. For instance, this type of patient has a thin-walled vascular tree, especially in the brain. Hence there may be a personal idiosyncrasy for cerebral hemorrhage. These patients also have a hypoplastic aorta with small coronary vessels, hence they are predisposed to coronary arterial disease, interstitial fibrosis of the heart, and premature cardiac accidents. Graves's disease and persistent thymus are not infrequently related and may coexist in the same patient. A hyperplastic thymus is the rule in sudden death of patients suffering from Graves's disease. Finally, we know that asthmatics frequently belong in the thymico-lymphatic group with hypoplastic aorta, hypoplasia of the adrenal medulla, and lymphoid hyperplasia.[8,9,10] We, therefore, can associate with the persistent thymus the following predispositions to accident:

1. Cerebral hemorrhage.
2. Myocardial disease.
3. Graves's disease.
4. Asthma.

This last relationship has helped us form some conception as to the mechanism existing; that is, that the reaction between the anesthetic and the liberated nucleoproteins derived from the breaking down of tremendous numbers of lymphoid cells results in an anaphylactoid reaction. This is well borne out at autopsy when in these patients we notice large numbers of necroses occurring in the lymphoid areas, especially in the lymphoid follicles along the gastro-intestinal tract and in the thymus. As most of these split-protein products are liberated into the venous system, pulmonary edema is practically always found at autopsy.[10]

COMMENT ON FOUR CASES

During the past year, I have had the opportunity of studying four persons to determine the cause of death occurring under general anesthesia on the operating table. The first was in a female twenty-nine years of age, who died during a simple appendectomy soon after the abdomen was opened, and before any manipulative work was done. The second was a male, nineteen years of age, who succumbed at the end of an operation for hernioplasty. The third was a Chinese boy, sixteen years of age, who died during a tonsillectomy. The fourth was a male, fifty-five years of age, who expired during a thyroidectomy. In the female patient (first case) the recessive type of status lymphaticus with microscopic lymphoid hyperplasia was seen. There was an interstitial fibrosis of the heart with a coronary sclerosis out of all proportion to her age. In the second, third, and fourth, the thymus glands weighed 33, 38, and 80 grams, respectively. All of the male patients showed essentially the same anatomical findings, and the observations will be summarized as follows: The thymus in each instance was tremendously enlarged, and showed a marked hyperplasia with engorgement of the sinuses, and scattered focal necroses in the lymphoid elements. Pulmonary edema was marked in all, and there was some microscopic lymphoid cell infiltration of the lungs in the region of the hila. There was a moderate hypoplasia of the aorta with some coronary arterial disease, even in the young Chinese boy. The thyroid patient (Case 4) showed fairly marked medullary hypoplasia of the adrenals with definite eosinophilic cell infiltration. The entire lymphoid system, apart from the thymus, was hyperplastic in all cases, especially along the gastro-intestinal tract. Some of the lymphoid areas in this latter region showed focal necroses and areas of edema in the wall of the intestines.

There appears to be sufficient evidence from the above data that sudden death in many cases may safely be associated with the thymic constitution and its allergic interrelationship.

IN CONCLUSION

In conclusion, then, we see that sudden death under general anesthesia may occur and does occur regardless of the operation or the satisfactory physical condition of the patient. It does not reflect on the anesthetist, the surgeon, or the physician who conducts the preoperative examination. It is usually due to a combination of hereditary and constitutional anomalies, plus a personal idiosyncrasy which, with our present knowledge and armamentarium, may be impossible to ascertain.

There are a few practical suggestions gained from this study which may be of value:

1. Avoid pressure on the carotid sinus during anesthesia.

2. Make certain that a suitable physical examination has been made and that the necessary laboratory data are known.

3. Insist on a diligent examination on definitely known asthmatic children before submitting them to a general anesthesia.

DISCUSSION

Paul H. Guttman, M. D. (605 Medico-Dental Building, Sacramento).—Doctor Michael has clearly pointed out that considerable controversy still exists on the question of status thymicolymphaticus. As the result of the careful studies of Hammar and, later, Boyd, conclusive data is presented which disproves the anatomical concept of status thymicolymphaticus. The size of the thymus and lymph nodes is dependent to a large extent upon the nutrition of the patient. In cases of sudden death from any cause, the weight of the thymus and size of the lymph nodes are large in well-nourished individuals. In those who suffer loss of weight as the result of prolonged illness, the weight of the thymus and lymph nodes decreases considerably. Failure to recognize these factors and the normal variation in the size of the thymus and lymph nodes has often resulted in the erroneous diagnosis of status thymicolymphaticus in cases in which the cause of death could not be determined.

It is often stated that degenerative changes are seen in the secondary follicles of the lymph nodes in status thymicolymphaticus. These changes are not constant and are frequently found in the course of normal involution of these glands and in toxic conditions unrelated to status thymicolymphaticus.

Although the anatomica concept of status thymicolymphaticus has suffered a blow as the result of the work of Hammar and Boyd, it is generally agreed that certain individuals who die as the result of trivial causes possess a constitutional inferiority which is not definable on an anatomical basis. Since we have no better terminology at the present time to classify this type of individual, it is well that the term "status thymicolymphaticus" is retained until this condition is better understood.

⁂

A. M. Moody, M. D. (St. Francis Hospital, San Francisco).—Doctor Michael has adequately covered the subject of sudden operative deaths in this paper. The first in his series of twelve causes, *i. e.*, "poor physical condition of the patient," will include many possible causes for sudden death when one adds to this anesthesia and varying amounts of surgical trauma and manipulation. The "constitutional inferiors" are quite apt to react abnormally during surgical procedures.

It should also be remembered that patients with diseased coronary arteries may die suddenly with or without occlusion of the arteries. The same may be said of those with fatty hearts.

Sudden operative deaths should be reduced considerably if the three practical suggestions offered by Doctor Michael in his conclusions are followed by all surgeons.

⁂

Jesse L. Carr, M. D. (University of California Hospital, San Francisco).—In undertaking to discuss the pathology of sudden operative deaths, Doctor Michael has attempted a project which most of us evade. There are two main reasons for this. First, the cause of sudden operative death is frequently obscure, and second, it always involves the discussion of the status thymicolymphaticus. No one likes to attempt a study which he cannot complete with satisfaction to himself and to others involved, but even more does he hesitate undertaking a discussion of a subject about which there is great controversy, and following which there will be many a dubious one who will infer that the discusser does not know what he is talking about. This is especially true of any problem involving the thymic state. In reviewing the cases at the coroner's office in San Francisco, one would want readily to accept the other eleven good reasons that Doctor Michael lists as causes for sudden operative deaths; but he still will find the thymic complex staring him uncomfortably in the face.

To one who has seen any appreciable number of sudden fatalities on the operating table, there can be no doubt of a thymic status, and there can also be no question either about the fragility of people who have endured such a state. They do not, at autopsy, show adequate cytological causes for having died, but they do show consistently a hyperplasia of lymphoid elements wherever they may exist, and they also have a large thymus. It makes little difference whether or not one is willing to admit that the thymus has any lymphoid tissue in it, or whether it is an epithelial structure, the fact still remains that people with a thymus too large for their age and correlated with a lymphoid overgrowth or hyperplasia are consistently found dying suddenly and without further cytological changes upon being anesthetized.

Although Doctor Michael has only considered the type which has died following ether anesthesia, we would like to call attention to the fact that they die during operation whether or not ether is used. We have seen a death in this type of individual following local infiltration for cutaneous anesthesia, and another following cocainization of nasal mucous membranes, and even in operative cases in which no anesthetic was used. They are no doubt less resistant and more sensitive in their reaction to general anesthetics than are normal persons. But they are also more sensitive to other untoward stimuli as well.

Unfortunately, there is no clinical gauge or measure of the extent of this status in the living, excepting perhaps the thymic shadow and general anatomical topography in the young, so that it is necessarily hard to apprehend the disease. Certainly, however, it should be taught that status thymicolymphaticus does exist, and is one of the things which contribute to a sudden operative death.

Doctor Michael's other causes and their pathologic pictures are most interesting and soundly reviewed.

INJECTION OF SYMPATHETIC NERVOUS SYSTEM*

By Paul G. Flothow, M.D.
Seattle, Washington

Discussion *by Charles F. McCuskey, M.D., Los Angeles.*

Despite all that has been done on diagnostic and therapeutic injections of the sympathetic nerves, there are still sympathetic operations being performed without adequate diagnostic measures to prognosticate the results.

There is little justification for unsuccessful operations on the sympathetic nervous system. This is particularly true of those operations employed for the relief of pain, in view of the fact that we have in hand a diagnostic measure that will determine definitely whether or not a given case will respond to operation.

By injection of the proper sympathetic nerves in cases of vascular insufficiency, it is a simple matter to determine quite definitely how much the blood supply to an extremity can be improved, and whether or not pain can be alleviated.

As far as we can ascertain, Von Gaza [1] was the first to inject the sympathetic nerves. He was followed by Swetlow,[2] White,[3] Flothow,[4] and others. The technique for injections of the sympathetic nerves is now quite well defined.

TECHNIQUE OF CERVICODORSAL SYMPATHETIC INJECTION

Swetlow's [2] technique will not be described. We use a technique illustrated to us by Lundy. For conditions pertaining to the head and upper extremities, it is necessary to insert only two needles: one opposite the seventh cervical spine which will bring the needle in position between the inferior cervical and the first thoracic ganglion, and the other opposite the first dorsal spine which will put it in approximation to the second dorsal ganglion.

---

* Read before the Anesthesiology Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13 to 16, 1935.

The technique is simple. Skin wheals are made opposite the spinous processes of the seventh cervical and the first thoracic vertebrae three centimeters from the midline. The needles are then inserted directly inward perpendicular to the surface of the body, until they encounter the transverse process. At this point a few cubic centimeters of procain are injected to anesthetize the periosteum. The needles are then inserted at a slightly different angle to slip just above or just below the nearer edge of the transverse process. After the needles slide past the border of the transverse process they are inserted directly inward for an added distance of three centimeters. This places the ends of the needles in very close approximation to the sympathetic ganglia. Many times one strikes the ganglia directly, as they lie between the bodies of the vertebrae and the pleura. From five to ten cubic centimeters of one per cent procain are then inserted in each needle. Within a few minutes definite signs of sympathetic injection occur, namely, Horner's syndrome, and a definite increase in the circulation of the extremity as evidenced by an increased warmth, an engorgement of the veins, a pinker color, and the absence of perspiration. If the injection is being done for pain and the signs of a successful injection are present with relief of pain, one may be quite certain that the pain is mediated by the sympathetic nerves.

TECHNIQUE OF LUMBAR SYMPATHETIC INJECTION

The technique is similar to that for the dorsals, and is also one described by Lundy. Needles are inserted three centimeters from the midline, but here opposite the interspaces rather than opposite the spinous processes of the first three or four lumbar vertebrae. The needles are inserted perpendicularly until they encounter the transverse processes. From this point the needles are advanced from four to five centimeters deeper. Usually five cubic centimeters of one per cent procain are inserted in each needle. In Labat's technique the needle is inserted from seven centimeters out at an angle of forty-five degrees. We use this at times as an alternate procedure. Both Labat's and Swetlow's techniques are not considered as safe as the injections we have described, owing to the possibility of entering the intervertebral foramina.

APPLICATION OF DIAGNOSTIC INJECTION

1. Cases of atypical pain: (*a*) Atypical facial pain. (*b*) Brachial plexus pain, painful stumps, etc. (*c*) Abdominal pain, gastrict crises, etc.
2. Migraine.
3. Pelvic pain and dysmenorrhea.
4. Vascular lesions of the extremities.
5. Malignancies of the face, neck, and pelvis.

In all of these conditions it is obligatory that the patient be experiencing pain at the time of the injection. In order to illustrate the application of diagnostic injections in these various conditions, we will present case reports of the various conditions.

We had recently a case of atypical facial pain which has all of the elements involved. A woman, aged 56, for twenty years had been having an excruciating pain in the right side of the face, head, neck, shoulder, and arm. The pain would come in paroxysms, lasting for about fifteen minutes, and from two to several hours apart. During this time never more than a day had passed without this pain being present. The only anatomic nerve supply which could possibly account for this type of pain was the sympathetic distribution from the cervicodorsal ganglia. Strangely enough there was a definite Horner's syndrome present which she had had ever since the onset of the pain. In this case a diagnostic injection was done, and the pain was promptly relieved. A diagnosis of a degenerative lesion of the sympathetic ganglia was made and the inferior cervical, and the first and second thoracic ganglia were removed, with immediate relief of pain. The ganglia were very small and sclerotic.

We have previously reported a case of brachial plexus pain due to malignancy, in which diagnostic injection relieved the pain.[5] This injection was followed immediately by alcohol, which made the pain relief permanent.

We have had quite a number of painful stumps in which diagnostic injection has failed to relieve the pain. Occasionally, however, one does encounter a case of painful stump in which diagnostic injection of the sympathetics brings relief, and in this type of case one may either use alcohol injection or surgical removal of the sympathetic ganglia.

We have had one case of gastric crisis in which bilateral procain injection of the fifth to the eleventh dorsal segments relieved pain. In this particular instance it was not necessary to inject alcohol, as the injection of procain served to give a permanent relief. We are unable to explain this occasional phenomenon.

A recent case of migraine, or hemicrania, in a young married woman, aged 26, illustrates the use of diagnostic injection in this condition.

Case 1.—This patient was instructed to enter the hospital at the height of her migraine attack. The pain being right-sided, we injected the right inferior cervical, and the first and second thoracic ganglia, and within a few minutes the pain had entirely disappeared. Not only had the pain disappeared, but the usual gastric upset and severe prostration which generally accompanied the attacks was aborted and she had no further trouble during this attack. This patient has been advised to have the cervicodorsal, ganglia removed surgically.

The application of diagnostic injection in pelvic pain and dysmenorrhea can be well illustrated by a case seen three years ago.

Case 2.—A married woman, aged 26, had had excruciating attacks of dysmenorrhea from the onset of her menses. The pain was so intense that for a period of six or eight hours it was necessary to administer opiates. This patient was injected within two hours of the onset of her pain, and within ten minutes of the injection of the lumbar sympathetics she was entirely relieved of pain. On this basis, alcohol was injected and she has gone three years without recurrence of the dysmenorrhea.

At present, where we are dealing with dysmenorrhea, we have been using a different type of injection, inserting the needle opposite the fifth lumbar vertebra to directly infiltrate the superior hypogastric plexus. This technique has already been described elsewhere.[6]

The use of diagnostic injections of the sympathetic nerves in vascular lesions of the extremities warrants a presentation entirely devoted to this subject. Suffice it to say that one can determine quite accurately in advance the amount of improvement of the circulation and relief of pain which can be expected to follow a sympathetic operation, merely by infiltrating the sympathetic ganglia for the purpose of diagnosis. If there is sufficient increase in temperature and evidence of increased circulation, or pain relief, then one can be certain that the operative removal of the sympathetic nerves will give the same result. We have had a large number of such cases to which we refer in previously published articles.[7, 8]

Regarding malignancies of the face, neck and pelvis, we will merely state the fact that in many of these cases one may find, by diagnostic injection of the sympathetic nerves, that there is a measure which can be applied to alleviate these painful conditions.

We might cite the case of a woman suffering from a very large, intensely painful, malignant growth involving the neck, the lower jaw, and the side of the face.

Case 3.—Owing to the location of the tumor it was impossible to inject the somatic nerves, and therefore we suggested an attempt to relieve the pain by way of the sympathetic nerves, knowing that often in malignancies the pain is of vascular rather than somatic origin. Injection of the cervicodorsal sympathetic ganglia in this case resulted in approximately 75 per cent relief of pain, which condition was made permanent by the injection of alcohol, and this woman spent the few remaining months of her life in comparative comfort.

The same type of injection may be applied in other malignant conditions of the head, neck, pelvis, and brachial plexus.

APPLICATION OF AND INDICATIONS FOR THERAPEUTIC INJECTIONS

We now limit therapeutic injections to cases in which surgical removal of the sympathetic ganglia is contraindicated. The advantage of alcohol injection of the sympathetic nerves lies in its simplicity. Its disadvantages are, first, that it is a blind procedure, and one can never be certain that all of the necessary sympathetic fibers are properly injected; second, it is not permanent; and third, it is followed in most cases by a rather severe neuritis.

We believe that surgical removal of the sympathetics, where not contraindicated, is a much better procedure than therapeutic alcohol injection. Alcohol injection does occupy a very important place, although we are doing less and less, feeling that if alcohol injection is warranted, surgical removal is a more satisfactory procedure.

There are conditions, however, in which alcohol is the method of choice, namely, in malignancies of the face, head, neck, and pelvis, by virtue of the fact that the life expectancy in these conditions is usually not very long, and these patients are seldom good operative risks. Alcohol injection is also very valuable in the treatment of both angina pectoris and vascular lesions of the extremities in the aged.

For angina pectoris the injections are made at five points on the left side opposite the inferior cervical and the first, second, third, and fourth dorsal spinous processes. This is done in order to infiltrate all of the fibers which may carry painful sensations from the heart. Seventy-five per cent of the patients suffering from angina pectoris can be completely relieved of their anginal pain. The results of alcohol injection of the sympathetics for this condition have been excellent over a period of years. In our series of twenty cases, 80 per cent have been relieved of anginal pain, some as long as three years.

Up to the present we have confined our treatment of angina pectoris to alcohol injections. We have had no immediate deaths as a result of the injections. One man, who died a few days later, was suffering from severe coronary thrombosis at the time of the injection. He had no further cardiac pain following the injection of the sympathetic nerves. The risk is not great; we have been able to do twenty cases without a death referable to the injection, and the results have been more than satisfactory. The greatest disadvantage is the fact that these patients practically all have severe alcohol neuritis for a period of weeks or months. Heretofore, surgery has been contraindicated in most of these cases because of the extensive operation which would be necessary to remove all of the sympathetic fibers, and the extremely high mortality. Since Gask's operation, which we have described recently,[9] has been developed, it is possible to remove all of the necessary ganglia through an anterior approach, and, therefore, in the future good risks will no doubt be advised to undergo operative removal rather than alcohol injection.

We have long been at a loss to understand why thyroidectomy for angina pectoris should be accepted so enthusiastically by the profession since it is based upon unsound and unproved physiology and anatomy, whereas the alcohol injection or operative removal of the sympathetic ganglia is based on sound physiology and anatomy. The answer to this question is due, we feel, to the fact that the operation of thyroidectomy is one with which everyone is familiar, and one which is not surrounded by any mysticism; whereas apparently anything pertaining to the sympathetic nervous system is still more or less in the realm of hypothesis so far as the great majority of physicians is concerned, and for that reason they are prone to favor something unsound with which they are familiar rather than accept a sound principle with which they are not.

Regarding vascular lesions of the extremities: it is obvious that some cases of arteriosclerotic endarteritis are very poor surgical risks, and in these cases alcohol injection is preferable to surgical removal of the sympathetics.

Occasionally we use alcohol injection in cases of Buerger's disease where diagnostic tests give us a questionable result. In these cases we use an alcohol injection as a glorified diagnostic procedure. If injection results in improvement that is definite and continuous, it can always be followed by surgical removal of the sympathetic ganglia which will insure good results.

There are certain conditions in which diagnostic injections are of no value and are not used. These are conditions such as spastic paraplegia, multiple sclerosis, encephalitis lethargica, constipation and megacolon, and progressive muscular atrophy. Diagnostic injections are of no value since the effect of the injection does not last long enough for the result to be of any prognostic value. Neither are alcohol injections indicated, because if any procedure is indicated it must be a complete and radical removal of the sympathetics such as can be accomplished only by surgical removal.

We feel that certain selected cases of spasticity of the lower extremities are still amenable to sympathetic surgery in spite of all that has been written to the contrary.

Multiple sclerosis has been treated by ganglionectomy and in our few cases has been very successful.

We have never seen a case of encephalitis that has been benefited by operation.

Constipation and Hirschsprung's disease are brilliant examples of the good results of sympathetic surgery.

We have recently had a case which would indicate that progressive muscular atrophy may be checked and even improved by sympathetic ganglionectomy.

SUMMARY

To summarize, the really important field of injections of the sympathetic nervous system lies in the use of these injections for diagnostic purposes.

Many cases of atypical pain—facial, brachial, or abdominal—may be found to be pains which are mediated by the sympathetic nerves, and can, therefore, be relieved by the proper application of sympathetic surgery.

By diagnostic injection migraine is often found to be a sympathetic affection and can be relieved.

Many cases of pelvic pain, especially functional types of dysmenorrhea, will be found to be amenable to sympathetic surgery by a diagnostic injection.

In vascular lesions of the extremities it is possible by these injections to accurately determine which case is amenable to sympathetic surgery, and one can almost prognosticate from the injection how good the result of surgery will be.

In malignancies, particularly of the face, neck, and pelvis, we find that often a simple diagnostic injection will indicate a method that will give these people relief without any radical surgery, namely, alcohol injection of the sympathetics.

CONCLUSIONS

Diagnostic injections of the sympathetic nervous system should always be employed to determine whether or not pain may be relieved before advising any surgical procedure.

There is no reason why there should be unsuccessful operations on the sympathetic ganglia for the relief of pain or for vascular insufficiencies of the extremities, if diagnostic sympathetic injection is used to determine whether or not the case is a suitable one.

Alcohol injection of the sympathetic nerves is an extremely useful method for the alleviation of pain in malignancies of the face, neck, and pelvis.

The results of alcohol injection of the sympathetic ganglia in angina pectoris are excellent. From 75 to 80 per cent of these patients may be completely relieved of their anginal pain.

In vascular insufficiencies of the arteriosclerotic type many amputations may be saved by alcohol injection of the lumbar sympathetic ganglia, especially if this is preceded by a diagnostic injection.

While alcohol injection of the sympathetic nerves is a very useful procedure in some conditions, in the great majority of cases, if alcohol injection is warranted, surgical removal is the procedure of choice.

The surgeon accepts a grave responsibility when he advises surgical removal of the sympathetic nerves for any painful condition or any vascular lesion if diagnostic injection has not been employed to determine exactly what the result of this operation will be.

DISCUSSION

Charles F. McCuskey, M. D. (2439 North Commonwealth Avenue, Los Angeles).—In his paper Doctor Flothow has presented the question of diagnostic and therapeutic injection of the sympathetic nervous system. Novocain injections, to determine the origin of pain and the results that may be expected from sympathetic surgery, should be used routinely before subjecting these cases to surgery.

The importance of a thorough neurologic examination, before attempting any alcohol injection for the relief of pain, cannot be overemphasized. Careful examination will frequently show the patient to be a psychoneurotic, or psychotic—one in whom nothing can be improved by any type of treatment. We can always promise the patient to produce anesthesia in the painful area; but if the pain is central in origin he will not be benefited. Since I have been referring such cases to a competent neurologist before attempting any type of alcohol injection, I have avoided much grief for myself.

Patients suffering from angina pectoris, where the electrocardiographic and physical examinations are essentially negative, are the best type for obtaining satisfactory results. The technique of making the injections in various areas is not difficult for one familiar with regional anesthetic procedures. The decision as to the indications for the injection of alcohol requires careful consideration, and this method for the relief of pain should not be used promiscuously. There are no contraindications to diagnostic novocain injections.

NEUROSYPHILIS: ITS TREATMENT*

By Norman N. Epstein, M.D.
San Francisco

Discussion *by George S. Johnson, M.D., San Francisco; Edward Twitchell, M.D., San Francisco; Kendall Frost, M.D., Los Angeles.*

INVOLVEMENT of the central nervous system by a syphilitic infection is one of the most common and most serious complications of this disease. Invasion of the central nervous system by the Treponema pallidum occurs shortly after the infection has taken place. It is certain that these organisms become lodged in the various tissues during their general dissemination in the early period of syphilis, and that the large majority of cases of neurosyphilis become established during the first year of the disease. Although the central nervous system may escape involvement during the first dissemination of the Treponema pallidum, it may be ultimately affected if a later dissemination of the organisms occurs. In approximately 25 to 50 per cent of cases of early syphilis, abnormalities of the spinal fluid are found, varying from a slight increase in the cell count to the typical "paretic" findings. These patients, if treated poorly or if untreated, are potential candidates for the various forms of early and late neurosyphilis. In late syphilis about 25 per cent of the cases have involvement of the central nervous system.

By detection of neurosyphilis early in the course of a syphilitic infection, and by the institution of adequate therapy, many of the catastrophes of late neurosyphilis can be prevented.

LUMBAR PUNCTURE

The importance of spinal fluid examination cannot be overemphasized. No patient with syphilis, regardless of how early the diagnosis had been made nor how intensively he had been treated, should be discharged from observation without first having an examination of the spinal fluid.

In early syphilis lumbar puncture may be done at the conclusion of one and one-half to two years of treatment, whether the blood Wassermann or Kahn test is positive or negative. A latent neurosyphilis may be associated with a condition of a persistently positive blood Wassermann. In Wassermann-fast patients, or in those with relapsing positive tests on the blood, it will be found that positive spinal fluid findings are present in a large percentage of cases.

In latent and late syphilis without clinical signs of neurosyphilis, lumbar puncture should be done at the conclusion of one year of treatment. In those patients with definite clinical evidence of neurosyphilis, in the early or late periods of the disease, the spinal fluid should be examined before treatment is instituted and checked at six-month intervals as a guide in therapy. Where an abnormal spinal fluid has been found, a yearly lumbar puncture for three years should be demanded after the conclusion of treatment.

CLASSIFICATION OF NEUROSYPHILIS

The lesions of neurosyphilis are of two main types, namely, inflammatory and degenerative. The meningeal, meningovascular and cerebrovascular forms are essentially inflammatory, while the parenchymatous varieties, that is, general paresis and tabes dorsalis, are mainly degenerative. Although one or the other of these types may predominate, it is the rule to see various combinations of them. In early syphilis the inflammatory reactions occur almost invariably. In late neurosyphilis, about 60 per cent of the cases are meningovascular and 40 per cent parenchymatous. Asymptomatic central nervous system syphilis comprises a large group, and is comparable to the latent period of systemic syphilis.

TREATMENT

The eventual response to treatment in a given patient will depend upon the amount of destruction of nervous tissue which has occurred previous to the institution of treatment. This emphasizes the importance of detecting the condition as early as possible, and applying appropriate therapeutic measures.

The types of involvement in the central nervous system, which are found in the early period of syphilis, respond very satisfactorily in the majority of instances to the usual methods of treatment employed for systemic syphilis. The vigorous and continuous use of the arsphenamins, alternating with courses of the heavy metals, particularly bismuth, over a period of two to three years, will result in a serologic and clinical cure in approximately 75 to 85 per cent of cases. For those patients who prove resistant to this treatment, special methods of therapy must be employed.

NEURORECURRENCE

Neurorecurrence, or neurorelapse, is a clinical phenomenon which requires special mention. This condition represents an overwhelming infection of the central nervous system by Treponema pallidum, with the sudden development of an acute syphilitic meningitis, a cerebrovascular accident such as a hemiplegia, a monoplegia or a paraplegia, or various cranial nerve palsies. Neurorecurrence is usually seen in those patients who have had inadequate therapy during the early period of their infection. It indicates that there has been an interference with the mechanism of resistance in the patient, leaving the central nervous system defenseless against an attack by the Treponema pallidum. Although a rarity in the adequately treated patient, neurorecurrence is observed in about ten per cent of inadequately treated patients.

* From the Division of Dermatology, Division of Medicine of the University of California Medical School, San Francisco.

Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-fourth annual session, Yosemite National Park, May 13-16, 1935.

The control of this condition requires an intensified plan of treatment. We have employed with satisfactory results the following regimen. The patient is rapidly mercurialized with a course of intramuscular injections of mercury succinimid, grains one-sixth five times weekly for thirty injections, or grains one-fourth three times weekly for twenty injections. This is followed with a course of eight injections of neoarsphenamin 0.45 grams to 0.6 grams at intervals of one week. Examination of the spinal fluid at this time usually shows a marked reduction in the cell count and a general improvement in the other findings. Treatment is then continued without rest periods, with alternate courses of bismuth salicylate and neoarsphenamin for a minimum period of two and one-half to three years. A course of bismuth salicylate consists of twelve weekly intramuscular injections of 0.2 grams (3 grains) each, while neoarsphenamin is given weekly intravenously for from six to eight weeks in dosage of 0.45 to 0.6 grams.

PARENCHYMATOUS NEUROSYPHILIS

The introduction of tryparsamid by Jacobs and Heidelberger in 1917, and of pyrotherapy by Wagner von Juaregg in 1919, have been outstanding contributions to the treatment of all forms of resistant syphilis of the central nervous system, and in particular the parenchymatous types; that is, general paresis and tabes dorsalis. The outlook has changed for these patients from one of complete hopelessness to one where a reasonable chance of relief may be expected.

TRYPARSAMID

Tryparsamid has earned, in recent years, well-deserved recognition as the most effective drug in the treatment of neurosyphilis. It is a pentavalent arsenical, with a low spirocheticidal action. It seems to act therapeutically by increasing the tissue resistance of the central nervous system against the infection.

There is a general tonic effect upon the patient, resulting in an increase in weight and a feeling of well-being. Tryparsamid is essentially of value in the treatment of neurosyphilis and has little effect upon the systemic infection.

The use of tryparsamid should be restricted to the treatment of those patients with neurosyphilis who have been resistant to treatment by arsphenamin and bismuth, and to those with the parenchematous forms of the disease. It is the drug of choice in general paresis. Arsphenamin and bismuth therapy should be used in all cases of neurosyphilis for at least a period of six months before tryparsamid is employed, unless there are clinical signs of general paresis. This is advised because patients with neurosyphilis may and frequently do have systemic syphilis as well.

Tryparsamid is relatively non-toxic, producing few systemic reactions. It is tolerated by the patient with surprisingly little discomfort. It can be administered intravenously in two- to three-gram dosage weekly for long-continued series of injections (fifty to one hundred). The outstanding toxic effect is upon the optic nerve, which may lead to blindness. This can be prevented in a large measure by careful selection of patients who, by ophthalmoscopic examination, show no pathologic changes in the optic nerve. The visual fields should be checked frequently during the treatment, as a narrowing of the visual fields is the earliest objective sign of toxicity. Disturbances of vision precede objective changes in the optic nerve, and by discontinuing the drug serious reactions may be avoided.

Satisfactory clinical and serologic results can be obtained with tryparsamid only when long courses of the drug are employed. We give courses of fifteen weekly injections of two grams each, alternating with courses of six to eight weekly injections of bismuth salicylate, 0.2 grams each, continuously over a period of from two to three years. Stokes reports that in general paresis the use of tryparsamid will produce complete remissions in 35 per cent, partial remissions in 34 per cent, and no improvement in 29 per cent. In his series, death occurred in 5 per cent. This is quite remarkable when it is remembered that, with treatment by arsphenamin and bismuth, the incidence of remission in general paresis is only 3 per cent. In other forms of resistant syphilis of the central nervous system, the tryparsamid increases the percentage of favorable therapeutic results to a considerable degree.

PYROTHERAPY (ARTIFICIAL FEVER THERAPY)

The introduction of malarial therapy in the treatment of neurosyphilis by Von Juaregg in 1919 has been one of the most important and interesting contributions to the treatment of this condition. Following his report, many other methods of producing artificial fever were tried. Some of these have now been discarded. It is the opinion of most observers that the essential factor in this treatment is the hyperpyrexia which is produced rather than the method in which it is attained. Inoculation with the parasites of relapsing fever and rat-bite fever, injections of foreign proteins, injections of sulphur in oil and certain physical methods such as hot baths, heat cabinets, diathermy, radiothermy and electric blankets, have been used to produce artificial fever.

Although in some instances the effects are more dramatic with malarial therapy, the therapeutic results have been similar with all methods in which temperatures of 104 degrees Fahrenheit (40 degrees centigrade) to 106 degrees Fahrenheit (41.1 centigrade) are produced and sustained for several hours. Approximately one-third of the patients with general paresis obtain complete remissions, one-third partial remission, and one-third are unimproved, become worse or die as a result of the treatment. In tabes dorsalis marked relief of distressing symptoms is obtained in a large percentage of cases. Pyrotherapy is of definite value in the treatment of other forms of neurosyphilis which are resistant to chemotherapy. As a general rule, clinical improvement precedes serologic changes by many months. It should be remembered that ultimate clinical improvement in a given case will depend upon the amount of damage done to the nervous system before therapy was instituted. For example, a patient with general paresis may obtain a cure of his condition, but he may have little cerebral tissue left and practically be no better off than he was before treatment was instituted. For this reason, the earlier pyrotherapy is used for a patient with paresis, the more hope there is of restoring him to normal function.

Pyrotherapy produces therapeutic effects by a direct effect upon the Treponema pallidum and by a stimulation of tissue resistance. It has been shown that Treponema pallidum will die in the test tube and in the tissues at a temperature of 42 degrees centigrade (107.6 degrees Fahrenheit) sustained for one hour; at 41 degrees centigrade (105.8 degrees Fahrenheit) for two hours; at 40 degrees centigrade (104 degrees Fahrenheit) for three hours; and at 39 degrees centigrade (102.2 degrees Fahrenheit) for five hours.

During the past five years we have used several methods of producing artificial fever, including diathermy, a heat-cabinet method, and recently a method in which heat radiation from the body surface is prevented by wrapping the patient in a special manner with blankets. This method has been described recently in detail.[1] The blanket method has the advantage that temperatures of therapeutic height and duration can be obtained with simplicity and with safety in trained hands. Antisyphilitic therapy by drugs can be given simultaneously with the pyrotherapy, and there is little interference with the patient's normal activities. This method of pyrotherapy is ideal for the ambulatory patient, and by its simplicity broadens the application of this type of treatment.

Regardless of the method employed, the use of hyperpyrexia as a therapeutic agent is dangerous unless conducted in a properly equipped hospital, and by physicians and technicians trained in this work.

SUMMARY

A general review of the treatment of neurosyphilis, according to modern principles, has been presented and the following points emphasized:

1. The prevention of late neurosyphilis may be accomplished by examination of the spinal fluid early in the course of the disease, and by the application of proper therapeutic measures in the event that abnormalities are found.
2. Systemic syphilis is frequently associated with neurosyphilis and must be considered when a plan of treatment is proposed. A preliminary course of arsphenamin and bismuth, covering a period of six months, should precede the use of special methods and drugs effective particularly in neurosyphilis, except where paresis has developed or some acute cerebrospinal accident.
3. The use of rapid mercurialization with mercury succinimid is of particular value in the treatment of neurorecurrence.
4. The usual plans of treatment advised for systemic syphilis will eradicate the large majority of instances of neurosyphilis found in the early period of the disease.
5. The value of tryparsamid and pyrotherapy in the treatment of parenchymatous neurosyphilis and other resistant types has been discussed.
6. The eventual result obtained in the treatment of neurosyphilis will depend upon the amount of damage done by the disease previously, for a paretic may be clinically cured, but practically be no better off than before treatment was instituted.
7. By means of a simplified method of producing hyperpyrexia, described previously, the patient with resistant neurosyphilis may receive the benefit of chemotherapy and artificial fever given simultaneously. By this combination of treatment there is a greater opportunity for producing clinical arrest of the process.

DISCUSSION

George S. Johnson, M.D. (Stanford University Hospital, San Francisco).—Doctor Epstein has given an excellent summary of the treatment of neurosyphilis and has, I think, put proper emphasis upon those measures which have the greatest influence upon the neurological manifestations of this disease.

The spinal fluid examination is important, not only in disclosing neuraxis involvement and thereby indicating the necessity of keeping in mind the possibility of further invasion; it is also important for its negative value, giving the patient a security in regard to the subsequent development of neurosyphilis.

The importance of variation in treatment is clearly indicated in this paper. The intensive and uninterrupted use of the arsphenamins and heavy metals over a minimum period of two to three years is clearly indicated. In those resistant cases, the use of special procedures, such as tryparsamid and pyrotherapy, have entirely changed the outlook for these patients. Induced fever has unquestionably established itself as a valuable and, at times, indispensable aid in these cases. Doctor Epstein has made a notable contribution in his simplified procedure for inducing fever.

*

Edward Twitchell, M.D. (909 Hyde Street, San Francisco).—Our present knowledge of neurosyphilis really began with Widal, Ravaut and Sicard in 1901, with the study of the cytology and chemistry of the spinal fluid.

It was then discovered that the individual who might be free of any other symptoms of syphilis, might still show a large number of cells in his spinal fluid with increase of globulin.

Later on, when the Wassermann reaction was discovered, it was found positive in the spinal fluid in individuals in whom it might be negative in the blood. From that time on asymptomatic neurosyphilis had a definite place in medicine. This is entertainingly told in the recent monograph by Ravaut, entitled "Une nouvelle syphilis nerveuse."

The two great types of neurosyphilis, meningovascular and parenchymatous, have long appeared to me as comparable to the conditions in a jungle infested by noxious savages. Those living along the banks of the streams could easily be reached and destroyed by expeditions sent up the watercourses. Those, however, who had abandoned the streams and lived in the dense thicket away from the streams were reached with difficulty, and by the time the attackers had come up to them the attackers were too exhausted to make much of an offensive. Hence, the most effective way of dealing with the bush-dwelling savage was to set fire to the bush and burn or smoke him out.

This is practically the principle of therapy devised by Wagner-Jauregg. The syphilis which fails to respond to chemotherapy will respond to pyretotherapy. It is doubtful if cases of neurosyphilis should ever be dismissed without being subjected to some degree of pyretotherapy.

If it be not considered advisable to use malaria, with its undoubted dangers, one might use the other forms, notably that for which we are indebted to Doctor Epstein himself, and which I regard as a most important therapeutic advance.

Following such pyretotherapy, one should use the usual arsenicals, and particularly tryparsamid, which has penetrating power which the others lack, even though the effects are feebler.

⁂

Kendall Frost, M. D. (1930 Wilshire Boulevard, Los Angeles).—I have no new thought to bring into this discussion. Doctor Epstein's paper is a summary, and covers the ground so clearly that it only remains to emphasize certain points.

Particularly important is his advice to give adequate chemotherapy before rushing into the use of therapeutic fever. The only exceptions to this are perhaps the cases of acute paresis or optic atrophy.

Pyrotherapy is, at best, a fairly dangerous procedure and should be approached with caution. No patient should receive it without having had a complete medical diagnosis, in addition to his neurologic and serologic one. Then only can the decision be properly made of his fitness for such treatment, and which form of fever production would be best adapted to the situation.

I am inclined to feel that there is not quite the unanimity of opinion regarding the equal efficaciousness of various forms of production of fever. Of course, the majority of experience is with malaria, and other methods of producing high temperature have not been equally successful in all hands. Until we have more data on other methods, for the patient's sake as an individual, I believe he should have malaria unless it is for some reason contraindicated.

PUBLIC HOSPITALS IN CALIFORNIA CANNOT HOSPITALIZE NON-INDIGENT PATIENTS

OPINION OF THE APPELLATE COURT (FOURTH DISTRICT) AFFIRMING DECREE OF INJUNCTION RENDERED BY SUPERIOR COURT JUDGE K. VAN ZANTE

Because of its medical and legal importance and interest to the citizens and medical profession of the State of California, the opinion of the Appellate Court rendered on January 30, 1936, affirming, as modified, the decree of judgment rendered on December 4, 1933, in the Superior Court of Kern County, California, by Judge K. Van Zante is here reprinted.*

Civil No. 1761. Fourth Appellate District.
January 30, 1936

O. P. Goodall, T. M. McNamara, P. J. Cuneo, S. C. Long, H. N. Brown, F. J. Gundry, C. S. Compton, W H. Moore, L. H. Fox, and L. C. McLain, Plaintiffs and Respondents, v. Perry Brite, Stanley Abel, W. R. Woollomes, J. O. Hart, and Charles W. Wimmer, individually and as members of the Board of Supervisors of Kern County, and Kern County, a legal subdivision of the State of California, Defendants and Appellants.

[1] *Constitutional Law—Public Money—Gifts.*—Section 31 of Article IV of the Constitution prohibits cities and counties from making any gifts of public funds and from using public funds for private purposes, and the legislature cannot authorize the use of county funds for any such purpose.

[2] *Id.—Counties—Hospitals.*—While the board of supervisors of a county has the general power to adopt rules and regulations for the operation of a county hospital, that power must be exercised within the limits of their constitutional powers.

[3] *Id.—Public Health—Police Power.* — The promotion of the public health and general welfare of the citizens of a county falls within the powers granted to counties by Section 11 of Article XI of the Constitution.

[4] *Id.—Counties — Hospitals — Public Health — Police Power—Public Money—Gifts.* — The admission and treatment of patients in a county hospital who, either themselves or through legally responsible relatives, can provide themselves with equally efficient care and treament in private institutions in the county does not promote the health and general welfare of the citizens of the county and is not a proper exercise of the police power of that county, but results in the use of public money for private purposes in violation of Section 31 of Article IV of the Constitution.

[5] *Id.—Indigents—Hospitals—Public Health—Police Power.*—A patient in need of hospitalization, who cannot himself, or through legally liable relatives, pay the charges of a private institution, but who can pay something toward his care and treatment in the county hospital, should be admtted to the county hospital because the care of such sick and injured promotes the public health and general welfare of the community in which he lives.

[6] *Id.—Counties—Hospitals—Statutory Construction.*—In this action to enjoin defendant board of supervisors from admitting certain classes of patients to the county hospital, there was no merit in the contention that as the legislature has provided that certain classes of patients in the county hospitals may pay for their care, under the maxim, "Expressio unis est exclusio alterius," the members of no other class who can contribute to their care can be admitted, and that as it is provided that those belonging to certain classes shall be admitted, no others can be received.

[7] *Id.—Hospitals—Emergency.*—In such action, the injunction issued by the trial court should have provided that in cases of accident or sudden illness, or of public disaster, such as fire, earthquake, floods, storms or epidemics, people injured or rendered suddenly ill, and for whom immediate hospitalization is made necessary, should be admitted promptly; but in such cases investigation should be made of their abilities to pay for the services rendered, and the Board of Supervisors should not hesitate to collect the full cost of hospitalization from those able to pay, and from others not able to pay in full, a fair amount, to be determined after an investigation of their resources.

[8] *Id.—Injunction—Statutes.*—In such action, the injunction issued by the trial court was not sufficiently elastic, in that it failed to provide for any contingency arising from changes in state legislation relating to the classes to be admitted and the conditions of admissions to county hospitals.

Appeal by defendants from a judgment of the Superior Court of Kern County, K. Van Zante, Judge, in an action for an injunction. Affirmed as modified.

For Appellants—Thomas Scott, District Attorney; W. A. McGinn, Assistant District Attorney; Borton & Petrini, Special Counsel.

Amici Curiae for Appellants — Nutter & Rutherford, Stephen Dietrich.

For Respondents—Siemon, Claflin & Maas; Hartley F. Peart; Finlayson, Bennett & Morrow.

Amici Curiae for Respondents—Elvon Musick, Howard Burrell, E. Perry Churchill.

The plaintiffs are citizens and taxpayers of the County of Kern. The individual defendants are the members of the Board of Supervisors of the county.

Kern County maintains a hospital for the hospitalization of the sick and injured as well as for the care of the indigent poor and indigent aged of the county. The hospital is a well-equipped institution. With the tacit, if not the express, consent of the supervisors, it is the practice to admit as patients persons well able to pay for hospitalization in private institutions, either themselves or through relatives legally liable for their support, and also, persons who can pay only part of the cost of their hospitalization in the county institution and who obviously cannot pay the higher costs of private hospitalization. The plaintiffs challenged the right of defendants to use county funds to provide hospital care for these two classes of patients except in certain instances where such practice is permitted by statute.

It is freely conceded by counsel for defendants that they have provided hospitalization in the county hospital for these two classes of patients and that they will continue to do so if not enjoined by order of court. It is also admitted that in the past both these classes of patients have been asked to make "donations" toward the cost of their hospitalization; that no charges have been made against them and that no effort has been made to collect from any of them where the donations had not been made. It is also apparent from the evidence that some citizens of Kern County who were financially able to pay for hospitalization and treatment in private institutions had been hospitalized for considerable periods of time in the county hospital without making any payments therefor. The trial court, on ample evidence, found there were sufficient private hospitals in Kern County to satisfactorily care for all cases hospitalized in the county hospital where the patients, or relatives legally liable for their support, could have paid for private hospitalization. Therefore, we do not have presented here any question of the right of a county hospital to receive a patient possessing substantial means where there was no other hospital within a reasonable distance which could afford him proper care and treatment.

---

*See also comment on page 146.

Boards of supervisors are given the express power to establish and maintain county hospitals and to provide rules for their government and management. (Sec. 4223, Political Code.) A like power is given them to establish and maintain almshouses and county farms. (Sec. 4224, Political Code.) In Kern County the poor are cared for at the county hospital. Therefore, it is a combination county hospital and almshouse.

Defendants maintain that as the Board of Supervisors of Kern County is given the power to "establish" and "maintain" a county hospital and provide rules for its "government" and "management" the question of who shall be admitted and upon what terms is within the sound discretion of the board and cannot be controlled by injunction. They also urge that Section 11 of Article XI of the Constitution vests in counties police powers which are as broad as those possessed by the state, except where prohibited by statute. From this they argue that as the promotion of the health of the residents of Kern County, as well as the promotion of their general welfare, is one of the principal police powers given under this section they may admit to the hospital any resident of Kern County possessing the necessary qualifications of residence regardless of his ability to pay and without making any charge against him.

We will first consider these questions from the point of view of the admission to the hospital of those patients who either themselves, or through legally liable relatives, are able to secure and pay for hospitalization and treatment in private institutions.

Section 31 of Article IV of the Constitution "took from the legislature the power to give, lend, or authorize the giving or lending of the state's credit, or that of any county, city and county, city, or township, or other political corporation or subdivision of the state, in aid of or to any person, association, or corporation, municipal or otherwise, or to pledge the credit thereof in any manner whatever, for the payment of the liabilities of any individual, association, municipal or other corporation whatever; or to make or authorize the making of any gift of any public money or thing of value to any individual, municipal or other corporation whatever.

"These limitations divested the legislature of all power to make appropriations of money to any private or quasi-public corporation or to make any gift to any municipal or public corporation not under the exclusive control and management of the state. It also derived the legislature of the power to authorize counties to make donations or gifts or pledges of credit to such associations. The Constitution does not give to any department of the state government any power whatever to engage in private business or enterprise, or to manage and control private corporations or quasi-public corporations for private profit, although such corporations may be carrying on enterprises or performing functions which are for general public benefit and which tend to promote the general welfare. Our state government has no such powers." (*People* v. *San Joaquin Valley etc. Assn.*, 151 Cal. 797.)

[1] It has been held that this same section of the Constitution prohibits cities and counties from making any gifts of public funds and of using public funds for private purposes. (*Pacific Mutual Life Ins. Co.* v. *County of San Diego*, 112 Cal. 314; *City of Oakland* v. *Garrison*, 194 Cal. 298; *Chapman* v. *City of Fullerton*, 90 Cal. App. 463.) The legislature cannot authorize the use of county funds for any such purposes. (*Conlin* v. *Board of Supervisors*, 99 Cal. 17; *Conlin* v. *Board of Supervisors*, 114 Cal. 404; *Johnston* v. *County of Sacramento*, 137 Cal. 204.)

[2] It must be conceded that while the board of supervisors has the general power to adopt rules and regulations for the operation of the Kern County hospital, that power must be exercised within the limits of their constitutional powers. It must be further conceded that if their acceptance for hospitalization of patients who, themselves, or through legally liable relatives can provide efficient hospitalization elsewhere, amounts to a gift of public funds to private persons which is prohibited by Section 31 of Article IV of the Constitution, its continuance may be enjoined by the courts.

In discussing the extent of the grant of police powers to municipalities by Section 11 of Article IV of the Constitution the Supreme Court in the case of *Miller* v. *Board of Public Works*, 195 Cal. 477, said: "The police power of a state is an indispensable prerogative of sovereignty and one that is not to be lightly limited. Indeed, even though at times its operation may seem harsh, the imperative necessity for its existence precludes any limitation upon its exercise save that it be not unreasonably and arbitrarily invoked and applied. (*Hadacheck* v. *Sebastian*, 239 U. S. 394, Ann. Cas. 1917B, 927, 60 L. Ed. 348, 36 Sup. Ct. Rep. 143; *District of Columbia* v. *Brooke*, 214 U. S. 138, 149, 53 L. Ed. 941, 29 Sup. Ct. Rep. 560; see, also, Rose's U. S. Notes.) It is not, however, illimitable and the marking and measuring of the extent of its exercise and application is determined by a consideration of the question of whether or not any invocation of that power, in any given case, and as applied to existing conditions, is reasonably necessary to promote the public health, safety, morals (*Hannibal etc. R. R. Co.* v. *Husen*, 95 U. S. 465, 470, 471, 24 L. Ed. 527; *Boston Beer Co.* v. *Massachusetts*, 97 U. S. 25, 24 L. Ed. 989), or general welfare of the people of a community. (*Chicago, B. & Q. Ry. Co.* v. *Illinois*, 200 U. S. 561, 592, 4 Ann. Cas. 1175, 50 L. Ed. 596, 26 Sup. Ct. Rep. 341; see, also, Rose's U. S. Notes.) . . .

"In its inception the police power was closely concerned with the preservation of the public peace, safety, morals, and health without specific regard for 'the general welfare.' The increasing complexity of our civilization and institutions later gave rise to cases wherein the promotion of the public welfare was held by the courts to be a legitimate object for the exercise of the police power. As our civic life has developed so has the definition of 'public welfare' until it has been held to embrace regulations 'to promote the economic welfare, public convenience and general prosperity of the community.' (*Chicago, B. & Q. R. R. Co.* v. *Illinois*, supra.) Thus it is apparent that the police power is not a circumscribed prerogative, but is elastic and, in keeping with the growth of knowledge and the belief in the popular mind of the need for its application, capable of expansion to meet existing conditions of modern life and thereby keep pace with the social, economic, moral, and intellectual evolution of the human race. In brief, 'there is nothing known to the law that keeps more in step with human progress than does the exercise of this power.' (*Streich* v. *Board of Education*, supra), and that power 'may be put forth in aid of what is sanctioned by usage, or held by the prevailing morality or strong and preponderant opinion to be greatly and immediately necessary to the public welfare.' (*Noble State Bank* v. *Haskell*, 219 U. S. 104, Ann. Cas. 1912A, 487, 32 L. R. A. [N. S.] 1062, 55 L. Ed. 112, 31 Sup. Ct. Rep. 186; see, also, Rose's U. S. Notes.)" See, also, *Coelho* v. *Truckell*, 82 Cal. App. Dec. 639.

In *Jardine* v. *City of Pasadena*, 199 Cal. 64, it is said: "The selection of the hospital site was a matter within the legislative discretion of the board of directors of the city, and unless in the exercise of that discretion the board acted arbitrarily and unreasonably, its action ought not to be enjoined.

"'The location, establishment and maintenance of such an institution is clearly within the scope of the police power of the city. General police authority to protect the public health is conferred upon the city by Section 11 of Article XI of the state Constitution, which provides that "any county, city, town, or township may make and enforce within its limits all such local, police, sanitary and other regulations as are not in conflict with general laws."'"

[3] It follows as an inescapable conclusion from what has been said in the cases from which we have quoted that the promotion of the public health and general welfare of the citizens of Kern County falls within the powers granted to the county by Section 11 of Article XI of the Constitution. Does the hospitalization in the county hospital of those able to secure efficient hospitalization in other institutions promote the health and general welfare of the citizens of Kern County? The answer to this question will determine whether that policy falls within the protection of the provisions of Section 11, and also whether the expenditure of public funds for that purpose amounts to a use of them for a public purpose or gifts to private persons. This last follows, because, if the use of the money for the purposes specified promotes the health or general welfare of the people of Kern County, that in itself should be held to be expenditures for a public purpose and not gifts to private persons.

[4] In approaching this question it should be borne in mind that the record establishes the fact that there are excellent privately owned hospitals in Kern County with sufficient facilities to care for those who can pay for their care and treatment. It seems, therefore, that the question

is not so much the preservation of the health and general welfare of the financially able citizens of the county as it is one of the preservation of their private resources. If a patient can be given the same and equally efficient care and treatment in a private hospital that he can receive in the county institution his choice of a hospital does not determine his chances of recovery but merely the amount he must pay to be healed, and whether he will pay the established charge of a private institution, or nothing or the small donation hoped for by the county hospital. The preservation of the health and general welfare of the citizens of the county is a question of the prevention and cure of disease generally, and not the accomplishment of these ends by any particular means or in any particular institution. We, therefore, conclude that the admission and treatment of patients in the county hospital who, either themselves or through legally responsible relatives, can provide themselves with equally efficient care and treatment in private institutions does not promote the health and general welfare of the citizens of Kern County and is not a proper exercise of the police power of that county and results in the use of public money for private purposes.

We have further facts in the record bearing upon the question of the use of public money for private purposes. The defendants estimated the cost of hospitalization in the county hospital at three dollars per day per patient. In arriving at this figure no account was taken of a capital investment of several hundred thousand dollars, nor of depreciation. The amount of daily cost was reached by taking the total number at the hospital, which included the dependent aged, as the divisor, and the total spent for the operation of the hospital as the dividend, and dividing the result thus obtained by the number of days in the year. It is obvious that the daily cost of caring for an aged poor person who does not require hospitalization would not be as great as that of a strictly hospital patient. It is also obvious that the average daily cost of care and treatment of a patient hospitalized for a simple illness would not be as great as that of a serious operative case. The method used in reaching the daily cost per patient was so inaccurate and unbusinesslike that the result could not reflect the true daily cost to the county of any one patient. Thus must have resulted in gifts of county money to at least those patients who paid nothing and to those who paid only three dollars per day and who were serious operative cases.

[5] When we approach the question of those patients who are admitted to the county hospital and who cannot pay for hospitalization in private institutions but who can pay something toward their care and treatment, we have an entirely different situation from the one we have been considering. We must bear in mind that providing hospital facilities to those legally entitled thereto is a proper exercise of the police power of the county (*Jardine* v. *City of Pasadena*, supra) as it tends to promote the public health and general welfare of the citizens of the county. (*Miller* v. *Board of Public Works*, supra.) In the second phase of the case we have the problem of the care of the health and the promotion of the general welfare of what we may term the deserving needy but not the pauper class of the county. This class must be hospitalized at the county hospital or permitted to suffer without proper care. It is common knowledge that this class composes a considerable proportion of the body of the citizenship of any county. As a rule those composing it are honest, industrious, and often thrifty people whose welfare should be of first concern to any governmental agency. It is admitted that a resident pauper must be hospitalized at public expense. This is a matter of pure humanity and no one, solely because of poverty, should be permitted to suffer because of lack of funds. The same reasons apply with greater force to the class we are considering. We can visualize the head of a family who has employment and can keep it—an honest worker, frugal and thrifty, who supports his family, educates his children and has perhaps acquired an equity in a modest home. If he is injured, not in the course of his employment, the family income stops and he may require hospitalization and may lack the funds with which to enter a private institution. Must it be said that he should be refused admission to the county hospital because he is not a pauper when if he were a pauper he would be admitted without question? This would amount to the penalizing of honest industry, thrift and independence and would place a premium on indolence and shiftlessness. Under the principles of humanitarianism, and in the interest of a sound policy, we are compelled to hold that a patient in need of hospitalization, who cannot himself, or through legally liable relatives, pay the charges of a private institution, should be admitted to the county hospital because the care of such sick or injured promotes the public health and general welfare of the community in which he lives.

If it were necessary we could find another satisfactory reason for the admission of this class of patients to the county hospital. It is admitted that indigent persons are to be admitted when in need of hospitalization. As far as we know the term "indigent" has not been defined in California in so far as its use in connection with admissions to county hospitals is concerned. It has been defined in other states chiefly in connection with the admission of the indigent insane to hospitals. The term when thus used has been held to include persons with insufficient means to pay for hospitalization after providing for those who legally claim their support. (*Depue* v. *District of Columbia*, 45 App. D. C. 54; *In re Hybart*, 119 N. C. 359, 25 S. E. 963; *Mass. Gen. Hospital* v. *Inhabitants of Belmont*, 233 Mass. 190, 124 N. E. 21; *People* v. *Board of Supervisors*, 121 N. Y. 345, 24 N. E. 830.) Applying this definition to the instant case, we hold that the word "indigent," when used in connection with admissions to county hospitals, includes an inhabitant of a county who possesses the required qualifications of residence, and who has insufficient means to pay for his maintenance in a private hospital after providing for those who legally claim his support.

[6] Under the maxim, "Expressio unis est exclusio alterius," it is urged that as the legislature has provided that certain classes of patients in the county hospitals may pay for their care, the members of no other class who can contribute to their care can be admitted, and, further, that as it is provided that those belonging to certain classes shall be admitted, no others can be received.

We cannot agree with this argument. Boards of supervisors are given broad powers in providing for the establishment and maintenance of county hospitals and in prescribing rules for their government and management. (Sec. 4223, Political Code.) The word "management" has been frequently defined when used in legal phraseology. When used in a statute giving the husband management and control over his wife's property it has been held to mean that it gave him the power to invest her money. (*Sencerbox* v. *First National Bank*, 14 Idaho 95, 93 Pac. 369.) When used in the title of an act relating to reform schools it was held to include provisions in the act providing for the committing of certain juveniles to the schools. (*In re Sanders*, 53 Kan. 191, 36 Pac. 348.) See, also, *Watson* v. *Cleveland*, 21 Conn. 538; *Commissioners of the Sinking Fund* v. *Walker*, 7 Miss. [6 How.] 143; *In re Brennan's Will*, 251 N. Y. 39, 166 N. E. 797; *City of Topeka* v. *Independence Ind. Co.*, 130 Kan. 650, 287 Pac. 708; *Stagway* v. *Riker*, 84 N. J. Law 201, 86 Atl. 440. When a board of supervisors is given management of a county hospital, that body is given the power to adopt rules for the admission of patients, provided, of course, that they must admit those entitled by law to enter and cannot admit those whose reception is prohibited by law of the Constitution. In their rules of admission they should have the power to provide for the payment for care by those not financially able to secure hospitalization in a private institution, the amount to be paid to be determined to its maximum by the cost to the county of hospitalization of each individual patient and charged to the patient on his ability to pay. In the administration of public funds the supervisors are acting as trustees and they should so administer those funds as to lighten the taxpayers' burden as much as possible.

[7] Another class of patients which should be admitted to county hospitals deserves our consideration. In cases of public disaster, such as fire, earthquake, floods, storms, or epidemics, people may be injured or rendered suddenly ill and immediate hospitalization may be necessary to save life. The same is true in cases of accident or sudden illness. In such cases, delays in admissions to permit investigations of the financial conditions of the patients might cause loss of life. Such patients should be admitted promptly, investigation of their abilities to pay should follow. Ordinary humanity could dictate no other course. In such cases boards of supervisors should not hesitate to collect the full cost of hospitalization from those able to pay, and from others not able to pay in full, a fair amount, to be determined after an investigation of their resources. We have stricken clause "i" from the decree of the trial court and have added another under the same letter to provide for such cases.

[8] The decree in this case is not elastic. Over a period of years the legislature has changed and increased the classes to be admitted to county hospitals. That body may continue with such legislation and may provide for the admission of new classes, or restrict those now admitted, or place new conditions upon admissions. To take care of this contingency we have added clause "j" to the decree.

Defendants complain that the decree as rendered is uncertain in several particulars. Plaintiffs in effect admit the charge by proposing amendments to it. We have studied the decree as amended by them and have concluded that it substantially meets the objections of defendants. On our own motion we have stricken one paragraph which plaintiffs proposed to retain as we regard it as surplusage.

It is ordered that the decree of injunction rendered by the trial court on December 4, 1933, be modified by striking therefrom the words, letters and figures not appearing in the decree of injunction hereinafter set forth and adding the words, letters and figures appearing in the decree of injunction hereinafter set forth which do not appear in the said decree signed by the trial judge so that the decree of injunction in this case shall read as follows: (Following the title of the court and cause.)

"The above-entitled matter having been heretofore heard and determined by the undersigned Judge of the Superior Court of the State of California, written findings of fact and conclusions of law having been heretofore duly and regularly signed and filed herein ordering judgment in favor of the above-named plaintiffs and against the above-named defendants as hereinafter given and made, and the case being in all respects ready for final judgment and decree:

"It is therefore ordered, adjudged and decreed that the defendants Perry Brite, Stanley Abel, W. R. Woollomes, J. C. Hart, Charles W. Wimmer, individually, and as members of the Board of Supervisors of Kern County, and Kern County, a legal subdivision of the State of California, and each of them, and every officer, deputy, agent, appointee, subordinate, servant or employee of the above-named defendants, or either or any of them, and particularly and especially the officers, deputies, agents, employees, appointees, servants, doctors, superintendents, heads of departments, internes, nurses, and assistants, and all other persons acting under defendants or any of them in any matter relating to the operation, maintenance, administration, or conduct of that certain County Hospital of the County of Kern known as the Kern General Hospital, be, and each of such persons is, and all of them are hereby forever permanently restrained, enjoined and commanded to desist from admitting to and receiving as patients of, caring for, curing, treating, boarding, nursing, furnishing food or supplies or lodging to, or hospitalizing in, said Kern General Hospital, or at or in any out-patient clinic thereof, any person who, after due inquiry and investigation, is not found to be an indigent person as herein defined, or a dependent or partially dependent person in case of emergency, or who is found, after due inquiry and investigation, to be a person who is himself, or has a relative or relatives legally liable for his support, able to pay for and obtain proper and necessary medical or surgical or hospital care or treatment or services for himself elsewhere than in the county hospital except as hereinafter specified. The following should be admitted: (*a*) an indigent sick or dependent poor person; (*b*) a needy sick and dependent or partially dependent citizen in case of emergency; (*c*) a psychopath, narcotic addict or habitual inebriate temporarily in custody; (*d*) a physically defective and physically handicapped person under the age of eighteen years when the parents or guardian of such person are not financially able to secure proper care or treatment and when such person's admission and treatment has been duly authorized in the manner provided by law; (*e*) a person in the active stages of tuberculosis, in wards established for the treatment of such persons, who is able to pay for such treatment and who, when able to pay, is required to pay for such treatment; (*f*) a person to be quarantined or isolated in the county hospital with a contagious, communicable or infectious disease; (*g*) a prisoner confined to any city or county jail who requires medical or surgical treatment necessitating hospitalization where such treatment cannot be furnished or supplied at such jail when the Superior Court of the county shall have ordered the removal of such prisoner to the county hospital and said prisoner elects not to furnish such treatment at his own expense; (*h*) a county employee injured in the course of his employment by the county when hospitalization is reasonably required to cure and relieve the effects of such injury; (*i*) a person in need of immediate hospitalization on account of accident or sudden sickness or injury or by reason of sickness or injury caused by or arising in a sudden public emergency or calamity or disaster. Provided, (*j*) Nothing in this decree shall be construed as restraining defendants from obeying or carrying out or giving effect to any law that may be passed hereafter relating to the hospitalization of patients in county hospitals which may affect the hospital in Kern County.

"It is further ordered that plaintiffs have their costs herein expended taxed at $306.62.

"Done in open court this fourth day of December, 1933.
"K. Van Zante, Judge of the Superior Court."

As so modified the judgment is affirmed. Each party will pay their own costs on appeal.

THE LURE OF MEDICAL HISTORY†

MOSES MAIMONIDES*

GREAT PHYSICIAN, SCIENTIST, AND PHILOSOPHER

By Frank H. Rodin, M.D.
San Francisco

THROUGHOUT the world the eight hundredth anniversary of the birth of Maimonides has been recently celebrated. Moses Maimonides, or as he is more commonly known among the Jews from the initial consonants of his name (Rabbi Moses Ben Maimon) the Rambam, was born in the Spanish city of Cordova, on the fourteenth of the Hebrew month Nissan (March 30), 1135 C. E. In Arabic literature he is known as Abu 'Imran Musa ben Maimun ibn 'Abd Allah. He was the greatest Jewish philosopher and physician of the Middle Ages, and also the most eminent religious authority and the outstanding physician of his time. Mohammedanism and Christianity were influenced by Maimonides' thought, and many thinkers drew consciously and directly from the inspiration of his works.

CORDOVA AS A SEAT OF LEARNING

The memorable battle of Jerez de la Frontera, fought in 711, affected the destiny of the Spanish people and indirectly the fate of the Jews who have found a home on the Pyrenean peninsula. Cordova was the most outstanding city during the rule of the Moslems, and under the liberal rule of the Mohammeds, Cordova became a great city, famous both for its commerce and learning. From all parts of the world scholars came to Cordova, where Jews, Christians, and Moors lived in peace. A friendly rivalry existed in the literary and philosophical endeavors of the various people who were subject only to the liberal Moorish rule. It was there that the Jewish people in 960 established their first academy. In the twelfth century, when Maimonides was born, Cordova had already passed the height of its glory, but it was prosperous under the reign of the noble Abderhaman.

ANCESTRY OF MAIMONIDES

Maimonides was the son of the celebrated Rabbi Maimon of Cordova, who was a learned man, and who could trace his descent from the House of King David. His mother, the daughter of a poor craftsman, died at the birth of Moses. His father taught him the Torah (Bible) and Talmud. At an early age he received instruction from the most distinguished Arabic teachers, who dominated Spain at that time, and he learned mathematics, astronomy, physiology, the natural sciences, and especially the science and art of medicine. His father endeavored to give him the most precious of wealth, which is the ideal of every Jewish parent: a complete and thorough all around education.

The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* In honor of the octocentennial celebration of his birthday.

From the Department of Ophthalmology of the Mount Zion Hospital.

MIGRATION OF THE MAIMUNI FAMILY

The peaceful life of the Maimuni was early disturbed by the Almohades, a wild tribe of Arabs from North Africa, who captured Cordova in 1148 and offered the Jews and Christians the choice of conversion to Mohammedanism or death. The Jews chose, as they have done throughout the ages and as they are doing now, to emigrate. The Maimuni family left Cordova and wandered through Spain, and finally settled, in 1159, in the city of Fez. Caliph Abdelmummen, who ruled Fez, required an outward observance of Moslem customs only, but did not interfere with the private life of his subjects. Here Maimonides and his family remained for a number of years and continued his religious studies.

The practice of their religion in secret did not appeal to the Maimuni family, and in time the life of the Jews became unsafe in Fez. Judah ha-Kohen ibn Shoshan, who was at the head of the Jewish community in Fez, and a friend of Maimonides, was found practicing Judaism. He was seized and executed. But for the influence of a friend, the Arabic poet and Moslem theologian, Abu al-Arab al-Mu'ishah, Maimonides would have had a similar fate. The family of Maimon once more moved and in 1165 came to Palestine.

Butchery by the crusaders and others had reduced the number of Jews in Palestine at that time to only a few thousand families. As there was very little possibility for intellectual comradeship, and the memories of the massacres being strong in his mind, Maimonides moved to Egypt. At that time there was a large Jewish population in Egypt, especially in Alexandria, in el-Kahira (new Cairo) and in Fostat or Fustat (old Cairo). Maimonides settled in the city of Fostat, and there, at the age of thirty, he established a permanent home.

LIFE IN EGYPT

Sorrow attended Maimonides on his migration to Egypt. First, his father died soon upon his arrival. This was soon followed by the loss of his elder brother, David, who was shipwrecked and drowned in the Indian Ocean, losing his fortune and considerable money entrusted to him by other traders. David, a dealer in precious stones, was the financial support of the entire family, and with his death Maimonides was left penniless and without the immediate means of earning a livelihood. He was, furthermore, burdened with the support of David's widow and orphaned daughter.

Maimonides denounced those who lived for gain by serving the Synagogue or Jewry by means of their learning. As it has been frequently the case with other learned Jews, the Rabbi, the healer of the soul, became the healer of the body. Religious leaders have frequently been the practitioners of medicine. In California, the Franciscans, who built the missions, also administered medical aid to both the Indians and the Spaniards. The first American medical publication was published in Massachusetts in 1678 by Dr. Thomas Thacher, a clergyman, who was also an Arabic scholar and a composer of a Hebrew lexicon.

MEDICINE AN OLD PROFESSION AMONG THE JEWS

Medicine is an old profession among the Jews. There is an unbroken line of Jewish physicians ever since the days when Jesus ben Sirach (second century B. C. E.) offered this advice:

> "Honor a physician with the honor due unto him,
> For the uses which ye may have of him:
> For the Lord hath created him. . . .
> The skill of the physician shall lift up his head:
> And in the sight of great men he shall be in admiration.
> The Lord hath created medicines out of the earth;
> And he that is wise will not abhor them. . . .
> My son, in thy sickness be not negligent:
> But pray unto the Lord,
> And he will make thee whole. . . .
> Then give place to thy physician,
> For the Lord hath created him;
> Let him not go from thee, for thou hast need of him.
> There is a time when in their hands there is good success."
> Ecclesiasticus, 38:1-13.

MAIMONIDES AS A PHYSICIAN IN EGYPT

Naturally, at first Maimonides was not well known, and hence his practice was not extensive. He therefore gave, in the meantime, public lectures on Jewish philosophical and religious subjects. The Jews in Egypt had a certain degree of self-government, and at the head of it was their own Nagid (Prince), who administered the internal affairs of the Jewish community. When Maimonides arrived in Egypt there was a spiritual schism, a frequent occurrence in Jewish life. A bitter strife existed among the Jewish people. It was not long before he became a leader over the affairs of the Jewish people. He became the Nagid; and as the official head of the Egyptian Jewish communities he united them, and soon the Jews from all over the world sought his advice.

His fame as a physician spread, and he gained the favor of the vizir Alfadhel; and through him came to the notice of the outstanding figure of the Middle Ages, the Sultan Salahin Jussuf ben Ajub, or as he is better known, Saladin.

It was during this period that Egypt reached one of her periods of greatness under Saladin. The last of the Fatimid Caliphs sat on the throne of Egypt (the Fatimids claimed descent from Fatima, Mohammed's daughter). In 1164, Egypt was invaded by Shirkuh, who was Nureddin's most brilliant general and military genius. In 1169 Shirkuh, with the aid of Saladin, conquered Egypt but died soon after. Saladin (1138-1193) was now appointed vizir.

Saladin appointed Maimonides as his court physician, a position which he held for the rest of his life, under Saladin and his successor, Alfadhel. He was a very busy practitioner, as a letter to one of his pupils, R. Juda Ibn Tibbon, shows:

> "With respect to your wishes to come here to me, I cannot but say how greatly your visit would delight me, for I truly long to communicate with you and would anticipate our meeting with even greater joy than you. Yet I must advise you not to expose yourself by the perils of the voyage, for beyond seeing me, and my doing all I could to honor you, you would not derive any advantage

from your visit. Do not expect to be able to confer with me on any scientific subject for even one hour either by day or by night; for the following is my daily occupation: I dwell in Mizr (Fostat) and the Sultan resides at Kahira; those two places are two Sabbath days' journey (one and a half miles) distant from each other. My duties to the Sultan are very heavy. I am obliged to visit him every day, early in the morning and when he, or any of his children, or any of the inmates of his harem are indisposed, I dare not quit Kahira, but must stay during the greater part of the day in the palace. It also frequently happens that one or two of the officers fall sick, and I must attend to their healing. Hence, as a rule, I repair to Kahira very early in the day and even if nothing unusual happens, I do not return to Mizr until the afternoon. Then I am almost dying with hunger. I find the antechambers filled with people, both Jews and Gentiles, nobles and common people, judges and bailiffs, friends and foes—a mixed multitude who await the time of my return. I dismount from my animal, wash my hands, go forth to my patients, and entreat them to bear with me while I partake of some light refreshment, the only meal I take in twenty-four hours. Then I go forth to attend to my patients, write prescriptions and directions for their several ailments. Patients go in and out until nightfall, and sometimes even, I solemnly assure you, until two hours and more in the night. I converse with them, and prescribe for them while lying down from sheer fatigue; and when night falls, I am so exhausted that I can scarcely speak. In consequence of this, no Israelite can have any private interview with me, except on Sabbath Day. On that day the whole congregation, or at least the majority, come unto me after the morning service, when I instruct them as to their proceedings during the whole week; we stay together a little until noon, when they depart. Some of them return and read with me after the afternoon service until evening prayers. In this manner I spend the day. I have related to you only a part of what you would see if you were to visit me."

OUTSTANDING PHYSICIAN OF THE EAST

Maimonides became the outstanding physician of the East and the leader of the Jewish people over the world. He was called the "eagle of physicians," and "lumen captivitatis," and "Moses Ægyptius."

Of his matrimonial life little is known. He had a daughter and a son. His son, Abraham, was also a physician and succeeded his father in high positions at the sultan's court.

Maimonides lived to the age of sixty-nine. He died on the twentieth day of the Hebrew month Teves (December 13), 1204 C. E. For three days the entire population, Jews and non-Jews in Fostat, were in mourning. In Palestine a fast was proclaimed. He was buried in Tiberias, in Palestine, and his tomb became a place of pilgrimage.

MAIMONIDES' WORKS

The Jew has always expressed himself in the language of the country in which he lives, and in Maimonides' time the language of most of the educated Jews in the Moslem possessions was Arabic. Maimonides wrote all his works in Arabic, with the exception of the *Mishneh Torah* (The "Commentary on the Mishnah" and the "Guide" were written in Arabic, but in Hebrew characters). However, all of his writings were promptly translated into other languages and, of course, into Hebrew. It is, therefore, natural that Hebrew translations of Maimonides are better known than the original Arabic. There are still a number of his works in the Arabic remaining untranslated.

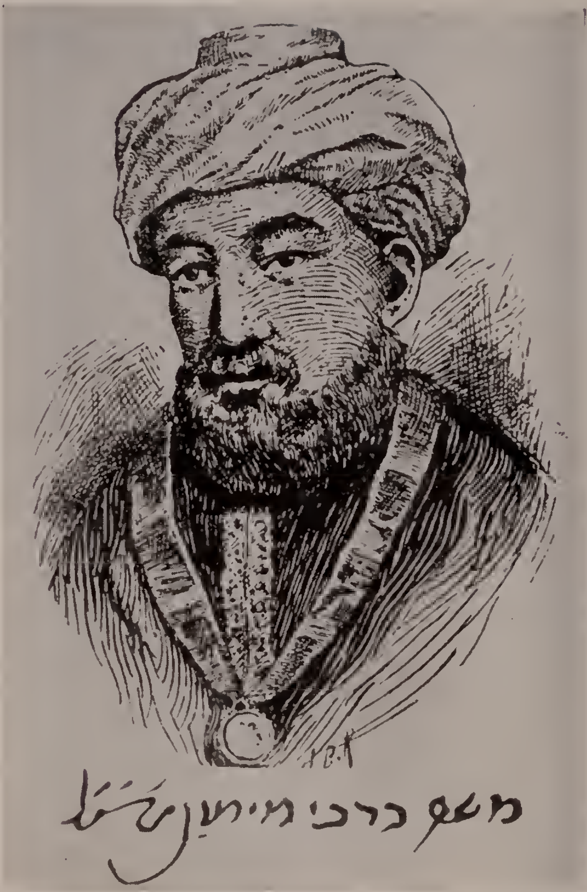

Fig. 1.—Traditional portrait of Maimonides, with autograph.

Maimonides' writing can be roughly divided into two categories: (*a*) Rabbinical and philosophical, and (*b*) scientific, mainly medical.

RABBINICAL AND PHILOSOPHICAL WRITINGS

It is difficult to give a fair estimate of Maimonides as a physician without some reference to his other writings, as the latter not only reflect his personality, but also contain medical matters especially dealing with anatomy and hygiene. While at Fez he wrote his great work, the *Pirush ha-Mishnayoth,* the Commentary on the Mishnah, which is the legal part of the Talmud. The Mishnah is regarded, next to the Bible, as the holiest of books, but its contents are difficult to understand. Maimonides successfully interpreted the Mishnah. We find him pleading for progressive scientific investigation: "A physician," he says in the Commentary on the Mishnah, "should begin with simple treatments trying to cure by diet before he administers drugs." "Like unto a murderer," he writes, "is the physician who refuses to tender his assistance in time of necessity, or who practices without due study of the ailment which he is treating."

His most famous philosophical work is the *Dalalat al-Ha'irin,* or Guide for the Perplexed, which he completed in 1187-1189. Although it was written in Arabic, he used Hebrew characters. In this work he attempts to bring peace and comfort to the perplexed, and to reconcile the perpetual conflict between faith and reason. "It is our purpose and our duty," he says, "to reconcile the apparent contradiction between reason and religion." He also tried to reconcile the philosophy of Aristotle with Jewish theology. To some degree he took a stand against the fundamentalism of the Bible and he pointed out, as Gershenfeld states: "That philosophy and science did not begin, nor did they end in the Scriptures and Talmud." Of course, such a view caused his condemnation by the orthodox, who claimed he was a destroyer of Judaism, while his followers considered him a liberalizer of Judaism. For many years, even after his death, the controversy continued. The "Guide," being controversial, acted as a stimulant in keeping alive philosophical ideas and studies for many centuries, and greatly influenced the ideas of later philosophers.

Another famous work is the *Mishneh Torah* or Double of the Torah (Repetition of the Law), which was the first complete digest, classification and codification of all Mosaic and Rabbinical laws. It is an encyclopedic work, and next to the Bible is considered the greatest work in the Jewish literature. In the *Mishneh Torah* Rambam develops a complete system of practical hygiene, which compares favorably with the modern conception of hygiene. He discusses fully the question of diet, the value of the various foods, the effect of the seasons, the care of the bowels, and the importance of proper sleep and exercise. He feels that overeating, alcohol, sexual excesses, and lack of exercise are responsible for many diseases. Attention to the simple rules of health will maintain good health.

Maimonides points out that for any town to be fit to dwell in, there should be: (1) a proficient physician, (2) a proficient surgeon, (3) proper bathing facilities, (4) proper sewage, (5) a fresh water supply, (6) a place of worship, (7) a proper school, (8) a scribe or notary public, (9) a court of justice, and (10) a charity organization. This is an ideal requisition even in this modern age.

MEDICAL WORKS

All his medical works were written in Arabic. It is natural that Maimonides should draw heavily from Galen's writings, since Galen was the standard medical authority among the Arabs at that time. However, his writings are enriched by his extensive personal observations and by actual experimentation. In addition to Galen he had studied Hippocrates' works.

His most popular medical work, known as Moses' Aphorism or Moses' Medical Aphorism or Principles, was *Kitab al-Fusul fi-al-Tibb,* and known in Hebrew as *Pirque Moshen,* written about 1190, when Maimonides was about fifty-five years of age. This work covers practically the whole field of medicine, the chapters alone showing how extensively the subject was treated. Essays on hygiene were written at the instigation of Sultan Alfadhel, Saladin's eldest son. It is known as *Makala fi-Tadbir al-Sihha,* and is composed of four books on diet and personal hygiene. Maimonides advised that we preserve our health in proportion of our abstinence from overeating and other excesses. He states that a pure moral life will lengthen one's days, while an impure life will shorten them. One should try to develop perfect self-control.

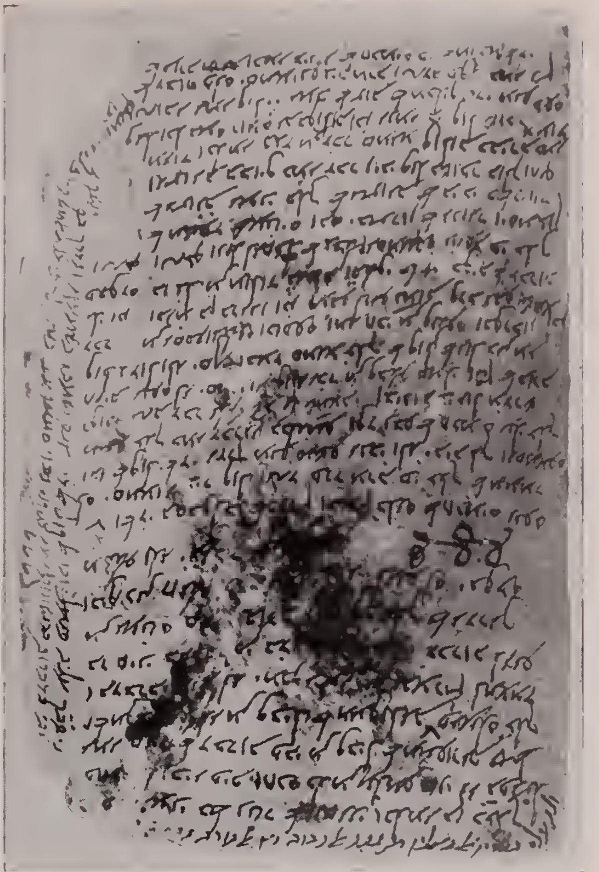

Fig. 2.—Holograph (?) draft of the "Dalalat al-Ha'irin" of Maimonides, Arabic in Hebrew characters. (From the Cairo Genizah.)

His book on poisons, *Al-Sumum wal-Mutaharriz Min al-Adwiyyah al-Kitalah,* also known as *Al-Makalah al-Fadiliyyah,* is in two volumes, and deals with various poisons and their antidotes. Egypt was infested with various poisonous animals, such as scorpions, spiders, snakes, mad dogs, etc. Maimonides discusses the poisons of these various animals, and also the poisonous plants, such as hyoscyamus, mandragora, cantharides, mushrooms, toadstools, etc. It is interesting to note that he observes that the incubation period of rabies was a lengthy one, and he states that the bite of a mad dog is to be feared, while the bite of a healthy dog is of no consequence. In the case of dog-bites, he states humorously: "Much depends upon the general health of the dog."

His directions for the treatment of poisonous wounds have a modern touch:

> "The first thing to do is to apply a tight band above the bitten part so as to prevent the poison from gaining entrance to the body. While this is being done, an assistant should make incisions in and about the wound, and then, after rinsing one's mouth with oil, or with oil and wine, the wound should be thoroughly sucked, being careful to spit out everything taken into the mouth. He who sucks the wound should have no sore places in the mouth nor any carious teeth. Should sucking be impossible, cupping may be resorted to."

Maimonides wrote two treatises on sex. This work is known as *Makalah fi al-Jama'ah*, and was dedicated to the nephew of Saladin, Malik al-Mustafir, Sultan of Hamat. There he discusses the whole problem of sex, sexual intercourse, abstinence, aphrodisiacs and anaphrodisiacs, etc. "When erection," he writes, "occurs in a natural and unconscious manner, and when after directing one's thoughts toward other subjects, one feels the erection persists, and if there is a sluggish sensation in the region of the kidneys, and the cords of the testicles are tightened and the flesh is warm, then one needs to have sexual intercourse, and it is hygienic to perform the act." He further asserts, that coitus will not be fruitful if performed in a sitting posture or standing.

In his work on asthma, *Makala fi al-Rabw*, he discusses the diet and climate best suited for asthmatics. There is also a discussion on the climate and food of various countries.

Maimonides wrote a good commentary on Hippocrates' Aphorisms and, besides, an extract from Galenic writings. He recommends only simple remedies and usually those which he himself tested.

Maimonides practiced medicine with religious fervor, considering it a sacred and holy calling, which indeed it is. This he expresses well in a letter to Jonathan of Lunel: "Although from my boyhood the Torah was betrothed to me, and continues to hold my heart as the wife of my youth, in whose love I find a constant delight, strange women whom I first took into my house as her handmaids become her rivals, and absorb a portion of my time." This strange woman was Medicine. For, as Robinson states: "Medicine is a jealous and absorbing wife, demanding wholehearted fidelity, permitting a little straying only that the wanderer may return with more eagerness to the legitimate consort, not granting her rewards to mortals who seek her for pastime or for bread, but whispering her secrets to those who slave with joy for her sake alone."

According to Maimonides, the purpose of medicine was: "To teach humanity the causes of ill health, the correct dietetic hygiene, the methods of making the body capable of useful work, how to prolong life, and how to avoid disease. It thus directly elevates the human being to a higher moral plane where the pursuit of Truth is possible, and where the happiness of the Soul is obtainable"—a definition of medicine which is still applicable, and which is the ideal of true medical research and the dream of those who still find idealism in the practice of medicine, even in these days!

TRIBUTE TO MAIMONIDES BY AN ARABIC POET

The greatness of Maimonides as a physician was well recognized, and the Arabic poet and cadi, Al-Sa'id ibn Surat al-Mulk sang it in estatic verse, which, translated into English, is as follows:

Galen's art healed only the body,
But Abu 'Imran's (Maimonides), the body and the soul.
With his wisdom he could heal all the sickness of ignorance.
If the moon would submit to his art,
He would deliver her of her spots at the time of full moon,
Cure her of her periodic defects,
And at the time of her conjunction save her from her waning.

IN CONCLUSION

Maimonides gave the world the Jewish ideal of a physician!

Both Hebrews and Arabians have a common saying:

"Mimoshe we' ad Moshe lo kom k'Moshe,"—

"From Moses the Lawgiver until Moses ben Maimon, there was none like Moses."

* * *

Among the many valuable manuscripts possessed by the Sutro branch of the California State Library in San Francisco, there are many scrolls upon which the Pentateuch is inscribed and which are of undoubted antiquity. One of these scrolls is supposed to be the one mentioned by Maimonides and having been written by himself.

In a passage from the *Mishneh Torah*, Maimonides speaks as follows:

> "The scroll of the law which I myself have written contains 226 columns of 51 lines each; the width of each column is four fingers (taking the Ezba as the width of the knuckle of the middle finger). The width of the columns on which the Song of the Sea and the Songs of Warning are written is six fingers. The length of the whole scroll is 1,366 fingers. The remaining six fingers—after deducting the quantum of 226 × 6 + 2 × 2—are for marginal space and the end of the scroll. The hides on which the scroll is written are buckskins."

Roubin, who made a careful study of the manuscripts, is of the opinion that the Sutro Scroll in question corresponds in every detail with these ritual suggestions.*

CLINICAL NOTES AND CASE REPORTS

STONE FORMATION IN THE UPPER URINARY TRACT

By S. I. Movitt, M.D.
Los Angeles

The factors of stone formation are as follows: (1) The precipitation of certain salts that are in the urine. (2) The parts played by the colloids of the urine, which maintain the balance of solubility of these salts. (3) Infection of the urinary tract. (4) Stasis of the urine.

Other factors, like heredity and geographical distribution, are interesting from a statistical viewpoint, but are too indefinite to form a certain basis for etiology of stones.

---

* Note: Some Arabic scholar may question the spelling of the Arabic words in the text. When the publisher's proofreader asked the famous British soldier, Thomas Edward Lawrence, about the inconsistencies of spelling in the Arabic names given in his book, "Revolt in the Desert," he replied that Arabic names will not go into English exactly, due to the fact that the Arabic consonants and vowels vary from district to district. To the proofreader's observations as to the variations: "Slip 20. Nuri, Emir of the Ruwalla, belongs to the 'chief family of the Rualla'. On slip 33, 'Rualla horse,' and slip 39, 'killed on Ruelli'. In all later slips, 'Rualla'," Lawrence answered, "should have also used 'Ruwala' and 'Ruala'."

Of the four above-mentioned factors we can readily advise the proper steps to diminish or abolish altogether the local infection, and suggest the proper remedy to relieve the stasis. As to the colloids, we are still almost wholly in the dark; perhaps here, eventually, will be found the keynote of stone formation, but so far all we know, as to their composition and character, is that they affect the surface tension of the urine. Now there remains the question of precipitation of salts as one of the causative factors of stone formation.

The solubility and excess precipitation of salts are very different in water and in urine, and are governed not by the same law in these two: this is due to the colloid bodies present in urine. The old advice, to prevent reformation of stones by drinking distilled water, is based only on the idea of eliminating the salts ordinarily present in the water; but the small quantity of these salts taken into the body in solution in ordinary water is infinitesimal in comparison to that ingested with food. The drinking of water is beneficial, of course, in that it increases the amount of solvent. When the loss of fluids by perspiration and physical work is considerable, the nitrogenous metabolism is high with a correspondingly large output of urea and salts.

So that, in the matter of diet, water must be definitely considered, and its intake prescribed in accordance with the patient's ability to eliminate it.

Supersaturation of urine or any other solution of salts must exist before crystallization occurs. Foreign material, such as epithelium, mucus, blood, foreign bodies, bacteria, do not cause crystallization in a fluid that is simply saturated. Neither is their presence necessary to start crystallization in a supersaturated urine. The formation of a colloid material which serves as a nucleus of a stone was suggested by Rainey nearly fifty years ago. Such colloid was thought to be the result of desquamative-degenerative changes in the renal pelvis or calyces; but colloid material of this kind exists in urine even under normal conditions, and many salts are kept in solution by such colloids. When they are separated from the colloids, by dialysis, they immediately crystallize. Several hours may be required for a clear alkaline urine to become cloudy (from crystallization of the phosphates), whereas if the colloids are removed from the urine this process occurs rapidly.

While it is true that the nucleus of a stone may be a foreign body, blood-clot, tissue remnant, parasites, or bacteria, it is also true that the majority of stones do not contain such foreign materials, but are composed of chemical precipitates and colloids, notably renal calculi, which consist of crystallized inorganic salts (either acid or alkaline in reaction) with a protein framework.

Crystallization (or precipitation) of solids in urine depends partly upon their concentration, partly upon the reaction of the urine, and partly upon the presence of colloids. But the presence of these three factors alone is inadequate for stone formation: there must also be *stasis*. As long as there is free flow of urine the crystals will be washed out as "sand" or "gravel"; but as obstruction sets in, a stone results. All these factors are essential for urinary stone formation, and if all of them are not present at the same time, stone formation cannot occur.

Another very interesting factor in stone formation was stressed lately in connection with the elimination of calcium from the body by the way of the large intestines and the kidneys, as related to parathyroid gland function. Hunter and Aub,[1] from their studies on human beings, and Greenwald,[2] from his studies on animals, found that with administration of parathyroid hormone the excretion of calcium in urine was increased markedly (whereas the excretion in feces did not increase appreciably). The same phenomenon is observed in hyperparathyroidism which is associated with increase of calcium content in the blood and tissues, the latter resulting in a great increase in output of calcium by the kidneys. But a marked increase in the normal urinary crystalloids adds so greatly to the burden put on the above mentioned protective colloids that they are unable to perform their work (to keep the crystalloids in solution) efficiently, then precipitation with formation of calculi is likely to occur.

Mandl recently illustrated this and conducted experiments to show the part which *obstruction* (stasis) may also play. Ten guinea-pigs were given ten units of parathyroid hormone daily for four weeks. During this period, artificial obstruction of the urinary tract was produced by compression of the urethra for from seven to twelve hours daily. Eight of these animals lived, and in three crystalline deposits formed in the renal pelvis. On post-mortem examination the other organs were found to be essentially normal, and in none of the control animals was there any evidence of formation of stones. Albright[3] and others called attention to the association of hyperparathyroidism and nephrolithiasis. Castleman and Mallory directed attention to the presence of renal stones in twenty of twenty-five cases of hyperparathyroidism reported from the Massachusetts General Hospital. In eleven of these cases the symptoms were referable to the urinary tract, and the skeletal changes were minute or were overshadowed by the renal lesions.

Thus, attention should be called to the importance of performing routine tests for serum calcium and serum phosphorus in cases of nephrolithiasis. This procedure was instituted at the Mayo Clinic about a year ago, and the problem is being investigated by the Section on Urology.

CHYLOUS ASCITES IN LYMPHATIC LEUKEMIA*

REPORT ON TREATMENT WITH X-RAY

By WINDSOR C. CUTTING, M.D.
San Francisco

THERE have been more than three hundred cases of chylous ascites recorded in the literature, and of these about five per cent have been due to involvement of the thoracic duct by one of the lymphoblastomata.

Blankenhorn,[1] in 1923, reported a mediastinal tumor causing chylothorax, which was treated by x-ray and radium. A year later the patient was living and seemingly well. In 1927, Ruddell[2] reported the treatment of a case of chylous ascites and chylothorax by radiation, but without any influence on the course of the disease. At section the thoracic duct was found to be obliterated by a large lymphogranulomatous mass, "probably of tuberculous origin." Cohn,[3] in 1931, noted the failure of radiation to alter the formation of chylous ascites in a case of lymphosarcoma.

The following case illustrates the temporary response which may follow radiation, and includes autopsy findings.

REPORT OF CASE

Summary: A man with lymphatic leukemia who developed chylous ascites which disappeared temporarily after x-ray therapy; retroperitoneal mass obstructing the thoracic duct found at autopsy.

June 27, 1934.—F. B., a 67-year-old salesman of Italian descent, entered the medical service because of painless lumps in his neck, axillae, and groins, which had first been noticed about six weeks before. The past history was irrelevant. Examination showed him to be obese, but not apparently ill. On both sides of the neck, in both axillae, and in both groins were large, rather soft glandular masses. The spleen and liver were not felt. He was not anemic; the white count was 31,000, with 94 per cent lymphocytes. The urine was normal and the blood Wassermann negative. Fluoroscopy showed no tumors in lungs or mediastinum. A diagnosis of lymphatic leukemia was made after a biopsy of a cervical lymph node.

X-ray therapy was started at once, with irradiation of all of the glandular masses. Forty r were given daily for one week, then every four days for two months, and then two at fortnightly intervals, the last treatment being on October 10. A total of 920 r was given to each of six 15 centimeters round areas. The glands rapidly diminished in size and by the completion of the treatment could barely be made out. No anemia had developed and the white count had been reduced to 12,000, with 80 per cent lymphocytes.

October 24, 1934.—Patient reëntered the hospital because his abdomen had become greatly swollen during the past three weeks, and he had lost strength and become dyspneic. Examination showed him to be cyanotic and to have an abdomen greatly distended with fluid. The glandular enlargements in neck, axillae, and groins had not recurred. The blood showed 3.8 million red cells, 84 per cent hemoglobin (Sahli), and 16,000 white cells, with 62 per cent lymphocytes. The colloidal osmotic pressure of the blood serum was 257 millimeters of water (moderately low).

Seven liters of chylous fluid were removed from the abdomen by paracentesis. This fluid was rose-pink in color, with an opaque, lustrous surface which suggested pink cream. It contained 1 per cent of fat and 4.4 per cent of protein. The sediment showed many red cells and lymphocytes. The liver and spleen were not palpable.

Since the chylous ascites was apparently due to leukemic infiltration along the thoracic duct, presumably with rupture of the duct, intensive x-ray therapy to the chest and abdomen was begun. Some 100 r were given daily for two weeks, the back and front being treated on alternate days. On November 5, while still being irradiated, two liters more of fluid were withdrawn from the abdomen. This was still opaque, but contained only 0.2 per cent fat and 4.5 per cent protein. When dismissed on November 12, he felt much stronger, had no ascites or glandular enlargements, and his blood showed 3.2 million red cells, 71 per cent hemoglobin, 4,000 white cells with 75 per cent lymphocytes.

January 6, 1935.—There was no evidence of reaccumulation of ascites.

January 24, 1935.—The patient reëntered the hospital because his abdomen had again been swollen for a week. Nine liters of chylous fluid similar to that obtained at the first tapping were removed. The blood showed 3.2 million red cells, 73 per cent hemoglobin, and 3,000 white cells with 50 per cent lymphocytes.

During February, fifteen more liters of similar fluid were removed in two tappings, in spite of a series of three daily 100 r treatments to the trunk, and a second of eight identical treatments about three weeks later.

March, 1935.—He rapidly lost strength, and in a final paracentesis on March 16 seven more liters of the usual pink, milky fluid were removed. In this fluid there was a large amount of Bence Jones protein, as determined by the following method: The ascitic fluid was centrifuged to remove the free red cells (it contained no hemoglobin) and then diluted 1:10 with normal saline. Three drops of 20 per cent sulphosalicylic acid per cubic centimeter were added, with mixture boiled, and filtered while boiling. On cooling the filtrate, a precipitate appeared which redissolved on a second boiling. There was no Bence Jones protein in the urine. The blood on March 19 showed 3.2 million red cells, 70 per cent hemoglobin, 3,000 white cells with 51 per cent lymphocytes; the blood calcium was 7.8 milligrams per 100 cubic centimeters, the blood phosphorus 3.4 milligram per 100 cubic centimeters, and the phosphatase 2.3 units.

March 25, 1935.—The patient died. The *autopsy report,* abstracted by Dr. Alvin J. Cox, Jr., is as follows: The body showed moderate brown pigmentation of the skin. The peritoneal cavity contained about 900 cubic centimeters of turbid orange fluid, and both visceral and parietal peritoneal surfaces showed poorly defined areas of thickening, with scattered punctate hemorrhages. There was only slight enlargement of the peripheral lymph nodes. The largest, which was in the left inguinal region, measured three centimeters in diameter. In the retroperitoneal region, however, there was extensive lymph-node enlargement. Above the pancreas was a large mass of fused lymph nodes measuring 12 by 6 by 4 centimeters, and surrounding the abdominal aorta was a nodular collar of soft, markedly congested abnormal tissue about three centimeters thick. The vena cava passed through the lower part of this mass, but the receptaculum chyli and the lower portion of the thoracic duct could not be identified, though its normal position lay within the mass of tumor. The spleen was not enlarged, and no leukemic infiltrations of other organs were visible grossly.

Microscopical sections of the lymph nodes showed extensive infiltration of small lymphoid cells which in many places were sharply limited by the capsule of the nodes. The liver showed small areas of infiltration in the portal connective tissue. The bone marrow showed small focal collections of similar cells. Infiltration was not seen in the spleen.

Primary anatomical diagnosis: Leukemia, lymphatic.

COMMENT

A case of lymphatic leukemia was complicated by chylous ascites, which was removed by paracentesis and did not reaccumulate for more than two months after x-ray therapy. Subsequently it recurred repeatedly, and autopsy showed obstruction of the thoracic duct by leukemic infiltration.

Stanford University School of Medicine.

FAULTY POSTURE CONTRIBUTING TO GASTRIC AND DUODENAL ULCER

By Frederick J. Walter, M.D.
San Diego

The writer has observed, over a period of years in medical practice, that gastric and duodenal ulcers occur more often in persons who sit a great deal, either at a desk or in faulty posture reading. The habit of sitting on the sacrum, rather than erect, is very common. This faulty posture, semi-reclining, pushes the costal arch inward, compressing the lesser curvature of the stomach and the cap of the duodenum, producing ischemia. Ischemia of the mucous membranes of the organs, with plenty of hydrochloric acid, would favor ulcer by allowing the bloodless tissue to digest its surface with resultant ulceration. It seems to me to be highly desirable that prolonged pressure should be avoided under the liver in this area during digestion. The frequency of ulcer in the lesser curvature of the stomach and the upper one-third of the duodenum would bear out this hypothesis.

It has also been my observation (both as a victim and with patients) that sitting erect and taking frequent deep breaths, if continued sufficiently long, has relieved the burning, gas, and distress.

I offer this as a most plausible contribution to the etiology, direct or indirect, to gastric and duodenal ulcer.

ACUTE APPENDICITIS ASSOCIATED WITH ACUTE MECKEL'S DIVERTICULITIS

By P. M. Hunter, M.D.
and
E. F. Kehr, M.D.
Carmel

The occurrence of acute inflammatory processes of Meckel's diverticulum, especially in children, is too well known to require recapitulation. In a symposium on "The Acute Abdomen," Miller and Wallace [1] have reviewed the literature on the anatomy and pathology of Meckel's diverticulitis, and have stressed the importance of searching for this condition when the appendix is not found to be acutely inflamed.

In our search of the literature we have not found a report of the association of Meckel's diverticulum and the vermiform appendix, each in an acutely inflamed condition sufficient to give rise to the acute abdominal symptoms and at the same time each having a small area of surrounding intestinal and peritoneal inflammation in no way associated with the other.

REPORT OF CASE

R. C., male, aged 32, had acute pain in the abdomen three days before admission to the Peninsula Community Hospital, which he attributed to indigestion due to hasty eating and fatigue from overwork. He was conscious for years of a small, annoying pain in his lower right abdomen, and felt that he "might have an appendix." On the evening before admission, he experienced very acute generalized abdominal pain, nausea and vomiting. In the morning, while at work, he called one of us. Examination revealed: Temperature, 100.4 degrees; pulse, 90; respiration, 16. The upper respiratory tract was negative. Lungs were clear and resonant, and the heart normal. There was moderate rigidity of the lower abdomen, especially of the lower belly of the right rectus. Pain only on deep pressure over McBurney's point. Rectal examination was negative. The leukocyte count was 26,500, with 82 per cent polymorphonuclear neutrophyllic cells. The patient was immediately admitted to the hospital for surgery, with the diagnosis of acute appendicitis.

After spinal anesthesia, a McBurney incision was made and the rectus retracted. As the peritoneum was opened a slight amount of serous fluid exuded. After placing the retractors, a thumb-like projection was seen through the opening. This was a diverticulum about seven centimeters long, two centimeters in diameter at its base and attached to the small bowel on its antimesenteric border. It was exceedingly inflamed in its proximal half and dark, hemorrhagic-black at its tip. No opening could be found. After ligating, excising and burying the stump with a purse string suture, we found it was located about one meter from the ileocecal junction. The surrounding ileum was moderately injected in an area of about three inches. The appendix was then located and found to be markedly swollen, about ten centimeters long and curved upon its tightened mesentery. There was great engorgement of its blood vessels and reddish-black in its distal portion. It was removed in the usual manner and closure was made without drainage. The patient, discharged from the hospital on the eighth day, made an uneventful recovery.

COMMENT

We are aware that, had the diverticulum not exposed itself immediately upon spreading the incision, we would have been content, having removed the acute appendix, and would probably have been acutely embarrassed at a later time with recurrence of symptoms remarkably simulating the appendicitis. Likewise, the hemorrhagic portion of the diverticulum might have been a peptic ulcer,[2] although no perforation could be found, and might have produced disastrous postoperative results had it been overlooked. This occurrence should stress the importance of further abdominal exploration, regardless of one's having found sufficient pathology to account for the surgical condition, since the percentage of diverticuli is from one to three per cent.[3]

Ocean Avenue.

BIOCHEMISTRY AS IT IS OF IMPORTANCE IN DERMATOLOGY

I

ENDOCRINES IN RELATION TO THE SKIN

LAURENCE R. TAUSSIG, M. D. (384 Post Street, San Francisco).—The glands of internal secretion have received considerable attention in recent years. In spite, however, of the large number of experimental and clinical observations which have been reported, much remains in the realm of theory and speculation. It becomes increasingly evident that the problem is a complicated one in that the activity of each of these glands is more or less dependent on that of the others. In addition, it is likely that this system is closely connected with the sympathetic nervous system, and that many of the effects ascribed to the endocrines are the indirect result of the action of the hormones on this system.

The pathologic changes in the endocrine glands can only be quantitative. We may have a total absence of secretion, hypofunction or hyperfunction. A true dysfunction, in the sense of a qualitative variation, is not possible.

The study of the internal secretions can only be approached by a relatively limited number of methods:

1. A study of the effect of changes in the gland in experimental animals or in human beings. Thus the surgical removal of all, or a portion of a specific gland, either in the laboratory or in the course of human surgery, provides an opportunity to study the effect of the absence or decrease of a single hormone. Furthermore, the quantitative function may be altered by either stimulating or retarding doses of roentgen radiation.

2. The effect of the ingestion, injection or implantation of an extract, or of the gland substance in patients in whom a hypofunction is suspected. The results of this type of substitution therapy must be considered doubtful on account of the possibility of some secondary action being responsible for the apparently good effect. In addition, the possibility of spontaneous regression of the condition under consideration must be kept in mind.

3. The special pharmacodynamic tests, such as cutaneous tests with organic extracts, injections of pilocarpin, atropin, adrenalin, and the Abderhalden ferment reactions, have been for the most part disappointing. This method of attack, however, promises to do more in the final solution of our problems than the other two.

The endocrine glands, especially the thyroid, have an important function in the basal metabolism, and in the development and growth of the organism. Certain gross malfunctions of these glands have been shown to produce well-known clinical syndromes, including more or less specific changes in the quality and texture of the skin and of its appendages. Among these are hyperthyroidism, myxedema, acromegally, infantilism, Simmond's disease, and so forth. The cutaneous changes in these conditions are well known, and there is no purpose in reviewing them here.

With the increase in the interest in endocrinology, it has become common to attempt to link various conditions, the etiology of which is not clear or entirely unknown, with the malfunction of one or more of the glands of internal secretion. This has resulted in a large mass of more or less uncritical reports of clinical observations, of which certain facts of value stand out conspicuously. It is perhaps of interest to mention a few of the commoner cutaneous disorders which may be due to an endocrine imbalance, and to indicate briefly some of the observations which have been reported.

Psoriasis is one of the conditions of which the etiology remains uncertain. A large number of cases have been reported which were apparently benefited by the ingestion of thyroid hormone. It is possible that the effect of the thyroid is wholly secondary, in that it increases the metabolic rate and causes a loss of weight. It has been noted that certain psoriatics have exacerbations of their disorder when they put on weight, and improve when they reduce. One group of investigators believe that the disease is closely connected with the function of the gonads. This is based on the fact that it rather frequently first appears at the time of puberty and tends to disappear about the fifth decade. It sometimes either improves or becomes worse during pregnancy. Instances have been reported of improvement from the use of gonad preparations. The pituitary was considered of importance in the pathogenesis of psoriasis, in at least some instances by Buschke and Curth, who found radiologic evidence of enlargement of the sella tursica in five of thirty-two cases. In general, it may be said that the evidence for an endocrine etiology for psoriasis remains doubtful.

In the case of scleroderma certain very interesting experimental results have been reported. In the laboratory the feeding of young white rats with parathyroid gland tissue has been found to cause a skin disorder, clinically and histologically, similar to scleroderma of humans. The surgical removal of the parathyroids has resulted in a cure of scleroderma in a number of instances. The French school maintains that scleroderma is associated with hypercalcinemia; and since the removal of the parathyroids decreases the blood calcium this may explain the benefit of parathyroidectomy. Clinical reports have indicated occasional good results from the use of thyroid medication. At the last meeting of the American Dermatologic Association, Engman and his associates reported a series of over twenty cases of scleroderma treated by injections of an extract of the anterior lobe of the pituitary, with improvement in every case but no cures.

Idiopathic progressive atrophic dermatitis and poikiloderma atrophicans vasculare have been considered by some authors to be due to functional changes of the endocrine glands, but the evidence so far is decidedly meager.

The not infrequent improvement of epidermolysis bullosa and the less common amelioration of xeroderma pigmentosum at the onset of puberty indicate that these conditions are closely connected with the internal secretions of the gonads. It is known that tinea tonsurans due to the microsporon clears spontaneously at the time of puberty. Some recent experiments tend to show that the hydrogen ion concentration of the secretions of the skin changes toward the acid side at this time, and this change, possibly due to the hormone effect, may be responsible for the cure of the tinea.

The incidence of acne vulgaris shows a possible connection with the development and activity of the gonads, but therapy by means of extracts of these glands has for the most part given disappointing results.

The importance of the endocrine system in the pathogenesis of the hyper- and hypopigmentary cutaneous conditions is undoubted. Nevertheless, substitution therapy in these conditions has been of benefit in but few instances.

This sketchy review is sufficient to indicate the tremendous importance of the endocrine glands in dermatology, but it also shows that at the present time our knowledge is too incomplete and inaccurate to do more than to stimulate further research in this field. Further work in determining and isolating the active elements of the various glands by biochemical means offers the greatest opportunity of solving the uncertainties which still exist.

II

THE MINERAL SALTS IN RELATION TO THE SKIN

Kendal Frost, M. D. (1930 Wilshire Boulevard, Los Angeles).—"The basic elements of the blood and tissue consist almost entirely of sodium, potassium, calcium, and magnesium. The minute amounts of rarer alkali metals, ammonia and organic bases, which have been demonstrated, are negligible in any consideration of the combined quantitative effects of the bases as such. At reactions so nearly neutral as those which prevail in the body, the alkali metals can exist only in combinations with acids as neutral salts (*e. g.*, free Na OH cannot exist to a significant extent). Consequently, the sum of the acid equivalents must equal that of the bases, in terms of positive and negative monovalent equivalents.

"Total base (B) $= Na—K—Ca—Mg = HCO_3 — Cl — PO_4 — SO_4$ plus protein and organic acid anions."

"In the human body the rule seems to hold that in the cells potassium is the predominant base, while in blood plasma sodium in molal concentration is about eighteen times as abundant as potassium. Other extracellular fluids proximate blood plasma in their electrolyte composition. In normal human serum the concentration of total base varies from 150 to 160 milli equivalents, of which five each are calcium and potassium, three magnesium, and the remainder sodium.

"A genuine understanding of the functions of sodium, potassium, calcium and magnesium, and their salts in the organism would necessitate a comprehension of the nature of protoplasm and its behavior in living cells—something we have not begun to attain. However, we do know that osmotic pressure within what we call physiologic limits appears to be necessary for the proper functioning of the cells of the mammalian organism. The maintenance of this osmotic pressure depends primarily on the total base content of both extra and intracellular fluids. Another rôle of the base is the maintenance of physiologic neutrality."

In the blood and tissue fluids, sodium is chiefly present extracellularly, while potassium is almost entirely intracellular. Calcium is present chiefly in bone, but is also in solution in the body fluids in combination with proteins, and also as an inorganic salt. Little or nothing is known regarding the significance of magnesium. It is present in bone and also in solution in body fluids. Most of the bases are in combination with chlorids, but the combination with weak acids—carbonates, bicarbonates, phosphates, and biphosphates—constitutes what are known as the buffer salts, which, in conjunction with proteins, maintain the acid-base balance.

"Chlorids assist in the maintenance of physical neutrality in the body fluids, and play a part in the distribution of water in the circulating blood, the intracellular tissue spaces and serous cavities, and the body cells. Sodium chlorid helps to maintain the electrolyte concentration of the fluids of the organism. With changes in the salt content of the fluid surrounding them, the tissue cells swell and shrink, and suffer by it when such changes are too great. The prevention of such disasters may be a part of the function of the chlorids.

"The rôles of phosphorus and sulphur have not been established on sufficiently concrete ground to discuss them with the other organic constituents of living tissues. The phosphates have some function as buffers in maintaining the normal p^H of the blood. Inorganic sulphates are found in varying quantities in all the tissues of the body, although the rôle of the sulphates is not well understood. They may represent a waste product from the conversion of other forms of sulphur en route to elimination." (Quoted and abstracted from Peters and Van Slyke.)

In turning our attention to the relationship of the metabolism of inorganic salts to diseases of the skin, it is necessary to consider the functions of these elements in terms of general physiology. With the means at our command, we are seldom able to demonstrate related disturbances of metabolism to any great extent, and therefore our conclusions have little practical clinical importance. In general, it can be said that the changes in the mineral content in the blood in skin diseases vary within normal limits. The group of dermatoses chiefly associated with abnormal findings in the mineral content of either the blood or the tissue are those referred to by the German school as the exudative dermatoses, chiefly eczema, seborrheic dermatitis, multiform erythema, and urticaria, although some of the observations include such disorders as rosacea, acne, psoriasis, and pemphigus. These changes concern chiefly the content of sodium, or sodium chlorid and calcium.

Some observations have been made on the calcium potassium ratio, and a little work has been done on the salt content in tissue in skin diseases by Urbach and Nadel. Urbach's figures for normal are somewhat lower, taking 200 to 320 milligram per cent as normal, whereas Nadel's normal for sodium chlorid is 522 to 615 milligram per cent. However, their results correlate pretty closely, namely, that there is an increase in the sodium chlorid content of the tissue in nearly all the inflammatory lesions of the skin, and in Nadel's series normal skin was examined in the same patients and an increase of sodium chlorid was noted in the normal tissue, although not as great as that in the affected part. The water content was proportionately increased with the sodium chlorid content.

Some of the most interesting work has been done on calcium. Klauder, in particular, has written on this subject. His animal experiments show that cutaneous irritability is decreased with an increase of calcium and a decrease of potassium. In his experiments the variation of sodium and magnesium determinations were so great that no correlation could be made between them and irritability. The determinations of the blood calcium itself show relatively little if any change from normal, although the calcium-potassium ratio has been shown by Nathan and Stern to be definitely changed in the blood during the eruptive phase, of several dermatoses of the erythema type. At the high point of the inflammatory process the potassium falls and the calcium rises, returning gradually to normal as the condition subsides. One observer, Hedge, found that therapy which increased blood calcium and phosphorus had a beneficial effect on psoriasis, although the normal constituents of these metals was not altered.

Some work has been done in France on the acid base equilibrium, chiefly by Spellman, Varin, and Weiss, who report a disturbance of acid-base balance in cutaneous reactions with an exudative factor; the disturbance may be either of acidity or alkalinity, 22 per cent on the acid side and 74 per cent on the alkaline except in psoriasis, in which there were eight cases toward alkalosis and one toward acidosis. Their conclusion is that, since these changes are not associated with general diseased conditions, they must be due to more subtle sources; as, for example, alimentation, hepatic dysfunction, and allergy.

The most practical discussions on mineral metabolism are concerned with the use of salt-free diets, which were first used in cutaneous tuberculosis, particularly lupus vulgaris. In a symposium on this subject in 1932 several German authorities discussed the matter. Most of them agreed that salt-free diets are of definite value in the exudative dermatoses, although one observer frankly stated that he felt the whole question of mineral metabolism was too little understood for us to be able to draw any practical conclusions with our present knowledge.

Keinung and Hopf have written considerable on the use of an equilibrated salt containing sodium, potassium, magnesium, and calcium in proportion to their normal concentration in body fluids as a substitute for table salt, and report results comparable with the use of the salt-free diet. Other observers abroad, and Eller and Reiss in this country, have not been able to confirm these findings.

We can conclude, therefore, that the mineral salts behave in disturbances of the skin as we would expect them to do according to their general physiologic behavior in the body, and that from an etiologic point of view we have no basis for considering them fundamentally as causative factors in the production of any diseases of the skin.

III

THE CARBOHYDRATE METABOLISM IN RELATION TO THE SKIN

George V. Kulchar, M.D. (450 Sutter Street, San Francisco).—In the past decade the association of various disorders of the skin with a high carbohydrate intake has gained wide clinical acceptance. The numerous reports of varying degrees of hyperglycemia noted in association with various dermatoses, and the apparent higher incidence of infectious skin diseases in diabetics have afforded some clinical support to this concept. There is, however, no adequate demonstration of any physiologic mechanism by which disturbances of the carbohydrate metabolism may produce pathologic changes in the skin. Many theories have been advanced to explain the genesis of dermatoses in patients with abnormal carbohydrate metabolisms. Kaposi[1] was of the opinion that some product of the recomposition of glucose acted in one of three ways: by direct stimulation of the sensory nerves of the skin with the production of pruritus, by the disturbance of the vasomotor and excretory physiology of the skin, or by exogenous irritation in the excretions of the skin. Bloch[2] advanced the theory that abnormal decomposition products may become accumulative and produce toxic changes resulting in altered reaction to endogenous and exogenous agents. Jadassohn[3] subscribed to a somewhat similar view. It is noteworthy that these observers believed that some decomposition product, not glucose itself, is the important agent in the genesis of the dermatoses.

However, it is a consideration of importance that diabetic patients having a consistently high blood sugar level do not commonly develop dermatoses or skin infections. From this observation it would seem that there are individual variations in the carbohydrate metabolism of the skin in the presence of a high blood sugar.

The glucose metabolism of the skin must be considered as being a part of the general body processes for the metabolism of carbohydrates, but that part is, however, far more than incidental. There is at the present time some evidence to suggest that the metabolism of carbohydrates is not dependent solely upon adequate pancreatic insular function, and that there is some substance in the anterior pituitary that may be a factor. Evans [4] and his coworkers, and Houssay [5] have noted hyperglycemia and glycosuria in normal animals following the injection of anterior pituitary extracts. Changes in the carbohydrate metabolism have been observed by Lehwirth [6] following the injection of follicular and corpus luteum hormones. Whether these observations are in any way related to the endocrine factors underlying certain skin diseases, as acne and seborrheic dermatitis, through alterations in the glucose tolerance is at the present time still conjectural.

The skin, representing about one-sixth of the total body weight, its bulk surpassing the liver, is an organ of considerable influence in the carbohydrate metabolism of the organism. A variable amount of the glucose ingested is temporarily stored in the skin. In fasting dogs, Folin, Trimble and Newman,[7] following the injection of large amounts of glucose (three grams of glucose per kilo of body weight) observed a marked rise in the skin dextrose level, varying from more than half to a level above that of the blood sugar. Simultaneous determinations of the muscle gave glucose values only from one-third to one-fourth that of the skin. From their studies they conclude that the skin is an important outlet for the sugar as it leaves the blood. The storage of glucose in the skin is, however, only temporary, according to these observers; because, in the fasting animal, the skin contains practically no glycogen and only about 10 milligram per cent more dextrose than the muscles. The increased storage of dextrose in the skin, as compared to muscle, is a finding of some significance. Either dextrose does not diffuse as rapidly into the muscle as into the skin, or the muscle rapidly transforms the diffused dextrose into other substances. Pillsbury and Kulchar [8] have observed the dextrose content of the epidermis to coincide closely with that of the whole skin.

The presence of glycolytic and diastatic enzymes in the skin has been demonstrated by Wohlgemuth [9] and his coworkers. They report, however, a wide variation in the diastase content of the skin. The glycogen content of the epidermis, according to Fahrig [10] varies from 226 to 344 milligram per cent, while that of the corium from 71 to 157 milligram per cent. Warren [11] has observed the glycogen content of the skin to be considerably lower in diabetics, a most interesting observation.

That the skin has an intrinsic carbohydrate metabolism, as evidenced by the formation of lactic acid *in vitro,* has been shown by the work of Fahrig, Wohlgemuth,[12] and Ikebata and, more recently, by the conclusive studies of Pillsbury.[13] Since the lactic acid formation occurs only at the expense of the carbohydrate material, it furnishes a convenient index of carbohydrate metabolism. From the work of Pillsbury it is apparent that skin containing abnormal amounts of dextrose is capable of forming lactic acid *in vitro* at an increased rate. In the normal living skin, according to this investigator, it is probable that the lactic acid formed above a certain level rapidly disappears. Even following the injection of large amounts of glucose into the blood stream there is no appreciable rise in the lactic acid level of the skin. The question as to whether any appreciable rise may occur in abnormal skin, and whether a high lactic acid content is productive of any gross physiologic changes, cannot be answered at the present time. Whether or not lactic acid is the hypothetical metabolite suggested in the theories of Kaposi, Bloch and Jadassohn, as being concerned in the production of pathologic changes in the skin associated with altered carbohydrate metabolism, remains to be determined. It is interesting to note that Leake, Hall and Koehler [14] have observed that the addition of lactate ion to perfusing fluids greatly diminishes the constricting effects of changes in the p^H on blood vessels. They suggest that lactic acid may assist materially in dilating blood vessels and maintaining adequate circulation. The injection of lactic acid solution into the skin of a normal individual in a concentration only slightly above that normally present will produce a definite pruritic erythema. The possibility of lactic acid being a factor in promoting skin infections is suggested by the work of Hall and Fraser,[15] who observed that the addition of lactic acid in culture medium greatly increased the bacterial growth. Irala[16] has noted that lactic acid in a concentration of 50 milligram per cent checks phagocytosis markedly. The specific toxicity of lactic acid for leukocytes has been reported by Evans.[17] However, no direct experimental evidence has been produced to substantiate the theoretical supposition of the rôle of lactic acid in the pathogenesis of dermatoses.

Most dermatoses are not accompanied by derangement of the carbohydrate metabolism, as indicated by fasting blood-sugar determinations and dextrose tolerance tests. However, this does not necessarily indicate that there is no derangement of the intrinsic carbohydrate metabolism of the skin. In man there is a fairly constant ratio between the dextrose content of the skin and of the blood, according to Urbach[18] and his coworkers. Following the ingestion of large amounts of glucose, this ratio may be disturbed. In "normal" individuals, in whom the resting value of skin glucose was from 40 to 50 per cent of the blood-sugar level, the maximum level of skin dextrose was reached in one hour following the ingestion of 100 grams of glucose. The rise was not as abrupt nor nearly as high as the blood sugar; but whereas the blood glucose returns to the fasting level in two hours, the skin commonly requires three hours to return to its original level. A second type of curve noted was that in which both the blood and the skin glucose reached very high levels, the maximum being delayed for two or three hours, and in which the blood and skin often required five hours to regain the fasting level. This they termed the diabetic blood and skin dextrose tolerance curve, having observed it in cases of pruritus, eczema, furunculosis, and gangrene. A third type of curve, which Urbach and Sicher call the sympathetic endocrine, is one in which the blood reaches a very high level (320 milligrams per cent) within an hour and rapidly falls with no abnormal increase in the height of the skin glucose curve. This type of curve they have noted in ulcer cruris and chronic ulcerative pyodermia. In contrast to this third type is the curve in which the skin glucose level approaches or exceeds that of the blood and very slowly (three hours) returns to the normal level. Urbach and Sicher consider this phenomenon as evidence of latent diabetes; but whatever the interpretation the intersecting blood and skin sugar curves represent a retention of dextrose by the skin and a disturbance of the normal ratio of skin to blood dextrose.

The sugar curves of the normal and dermatitic skin, and of the blood in rabbits that have received dextrose, have been studied by Miyake and Narahara.[19] In animals with extensive dermatitis they have observed a decreased sugar tolerance. From their studies they have concluded that inflamed skin commonly shows varying changes in its capacity for storing glucose; however, the residual normal skin in dermatitic rabbits functioned normally as indicated by the skin sugar curve, but the irritated skin did not show the slightest correlation with the normal.

Using a modification of the Hagedorn-Jensen[20] method, Pillsbury and Kulchar have studied the dextrose and water content of the dermatitic skin, the effect of hyperglycodermia on the water content of the normal and inflamed skin, and the dextrose content of the inflammatory crusts. Their interest in the water content of the skin was stimulated by the frequent observance of eczema in fat infants with marked turgor of the skin, many of whom were being given high carbohydrate diets, and by the recent study of McClendon[21] indicating marked water retention following ingestion of dextrose by adult subjects. McClendon believes that the skin participates in this water retention. Increased water content of the skin in infants fed exclusively on carbohydrates has been observed by Tobler and Bessau.[22] Pillsbury and Kulchar observed no significant variation in the dextrose content between normal and inflamed skin in rabbits fed a normal mixed diet, although the water content of the inflamed skin was slightly greater than normal. The dextrose content of the inflamed skin, however, is usually higher in animals receiving large amounts of glucose. This finding is in accord with that if Miyake and Narahara. There would seem to be some derangement of the power of inflamed skin to absorb dextrose following a sharp rise in the blood sugar.

The dextrose content of the inflammatory exudate and crusts, as compared with the underlying inflamed skin or the normal skin, is markedly increased, according to Pillsbury and Kulchar. This increase may be due to the concentration of dextrose during the drying of the inflammatory exudate.

The relationship of disturbances of the carbohydrate metabolism to skin infections has been the subject of considerable study. To summarize the pertinent studies, most of which are as yet unconfirmed, it is indicated that (1) while diabetics show a somewhat increased incidence of skin infections, severe diabetics may have an entirely normal resistance to such infections, and that the presence of increased glucose in the skin is not, apparently, the sole reason for decreased resistance to infection (Greenwood and Rockwood[23]); (2) that the blood of diabetics is deficient in antibacterial power (Richardson[24]); but that (3) a heightened intake of carbohydrate in normal dogs leads to no marked decrease in antibody formation (Kleinschmidt[25]), and that the simple addition of considerable quantities of glucose to blood does not lessen its bactericidal power of staphylococci (Handmann[26]); (4) that phlorizin diabetes increased the virulence of streptococci, but not of staphylococci in rabbits (Franceschetti[27]); (5) that administration of glucose in humans apparently decreases the self-sterilizing power of the skin (Cornbleet[28]); (6) that increases of sugar in the sweat of diabetics may lead to more favorable conditions for the growth of fungi and bacteria (Usher[29]); and (7) it is doubtful whether or not decreased carbohydrate tolerance is more frequently encountered in patients with skin infections than in normal individuals (Fischer[30]) (Rudy[31]).

Recently Pillsbury and Kulchar[32] have reported the effects of repeated injections of large amounts of glucose on experimentally induced skin infections in rabbits. The parenteral administration of glucose (7.5 grams per kilo) at twelve-hour intervals for a period of six days, had no effect on the virulence or course of the infections. The carbohydrate intake of these animals, translated into equivalent carbohydrate intake in the average man, would equal 975 grams of dextrose daily, an amount far above the average. However, when the glucose injections were increased to 15 grams per kilo and given at four-hour intervals, a marked increase in the degree and extent of the skin infections was noted within twenty-four hours. A similar effect was observed following the injection of equivalent amounts of hypertonic sodium chlorid solution of the same tonicity. The results of these experiments suggest that the virulence and extent of the infections noted, at least in the experimental animal, may be in some way linked with the water balance of the skin. This is in accord with the observations of McClendon and Tobler and Bessau, previously mentioned.

From the foregoing rather brief survey of the literature it is quite evident that, while the fact that the skin possesses an intrinsic carbohydrate metabolism has been established, and there is some causal relationship between disturbances of the carbohydrate metabolism, either as a result of diet or disease and certain dermatoses, there is as yet no demonstrable pathophysiologic mechanism to explain whereby these factors operate in the genesis of skin diseases.

IV

FATS IN RELATION TO THE SKIN

Frederick G. Novy, Jr., M. D. (411 Thirtieth Street, Oakland).—There have been, recently, two widely separated dermatologic conditions which have been studied from the viewpoint of a disturbance of fat metabolism. These are xanthomas and infantile eczema.

Xanthomas, since cholesterol crystals were found in the tumors in 1869, were thought to be due to an increase of cholesterol in the blood, and laid down locally in the skin at the site of trauma, or simply a deposition due to some other factor. The hypercholesterolemia was explained on the basis of some disease process in the liver or pancreas, leading to a disturbance of fat metabolism. However, many cases have been reported in which this explanation could not hold, as the blood cholesterol was well within normal limits.

Wile, Eckstein, and Curtis,[1,2] in 1929, reported three cases, and later two additional ones, in which they made careful chemical analyses of the tumors themselves, and of the blood. They found that the cholesterol content of the xanthoma tumor was only 16 per cent of the entire lipids present, in contrast to that of normal epithelium which is 20 per cent. Also, that cholesterol made up only 2 per cent of the solid content of the nodule. This shows that the lesions of xanthoma are not due primarily to cholesterol, but are only present along with the other lipids.

In studies on the blood serum they found no true increase in the blood cholesterol. In two of the cases the total lipids of the blood were normal, while in the other three there was a lipemia. One of these was a rather marked diabetic, and the association of a lipemia and diabetes is not an unusual finding. The other two cases showing lipemia had glucose tolerance curves of potential diabetes. While the cholesterol values in the diabetic patient were above normal, the relation of the amount of cholesterol to the total lipids of the blood was actually less than normal.

Michael and Nicholas[3] recently have carried the investigation of this subject further by analyzing all of the lipid fractions of the blood. They studied eight cases of xanthoma, including five cases of xanthoma palpebrum (xanthelasma), which they feel is the same disease as true xanthoma. In the blood serum of all but one of these cases, there was some variation from the normal relation of the different fat fractions. The normal relationship is considered to be 50 per cent neutral fat, soap, and fatty acids; 30 per cent phosphatids, and 20 per cent cholesterol. While there was a disturbance in this ratio, it was by no means a constant or definite one; each of these three components having a higher or lower value than the accepted normal in one or more cases. Six of the eight cases showed an increase or decrease in the neutral fats, and five showed either higher or lower values of the phosphatids and of cholesterol. These findings were in accordance with previous and similar work of Schaaf and Werner.[4] These last authors felt that the deviation from normal of the various component lipid fractions of the blood leads to a disturbance of the oil-water emulsion of the serum so that it becomes unstable, and there is a deposition of lipids forming xanthomatous tumors.

[3] Michael, J. C., and Nicholas, H. O.: Blood Lipids in Xanthoma, Arch. Dermat. and Syph., 29:228 (Feb.), 1934.

Michael and Nicholas attempted to demonstrate this by breaking down the oil-water emulsion of both normal and pathologic serums *in vitro* by the use of commercial products used in the petroleum industry for the breaking down of emulsions, but were unable to do so. They feel, however, that in the light of present knowledge, the most likely explanation for the formation of these tumors is that the blood emulsion has become unstable, as evidenced by their findings, and is so deposited in the tissues.

Wile and his coworkers did not note any exacerbation or enlargement of the tumors, with a high fat diet, showing that there is no direct relation between ingested fat and this condition. They did find, with a reduction diet, that there was a definite involution of the disease, and this was probably due to utilization of the lipids in the tumors along with the other body fats. At present this seems to be the only general therapeutic measure available for xanthomas.

Infantile Eczema

This disease, which has been the subject of investigation over a long period, and from many different angles, has only recently been studied from the standpoint of fat metabolism.

It has been noted that in animals placed on a diet deficient in unsaturated fatty acids there were marked skin changes. With this in mind, Hansen [5,6] recently made fat determinations on normal infants and those with eczema. He found that the iodin number, which is the number of grams of iodin absorbed by 100 grams of lipoid, was definitely decreased in the serum of those infants with eczema. The average iodin number was eighty-four, while the normal control group showed in the blood serum an iodin number of 111. This indicates that serum fatty acids are less unsaturated in infantile eczema than in the normal. The only other findings were that the serum cholesterol and total fatty acids were slightly less in the cases of eczema.

As this observation was constant, he decided to treat a group with an oil high in unsaturated fatty acids. For this he used linseed oil, which has a very high iodin number. When these cases, so treated, were carried to a point that the unsaturated fatty acids were normal in the blood serum, there was a remission of all symptoms. This was done on twelve cases, all with good results.

Cornbleet,[7] using maize oil, another source of unsaturated fatty acids, but not containing as large a quantity as linseed oil, has had similar results. He states that the oil must be used over a long period of time. The dosage he used was a tablespoonful three times a day, and gradually increasing to four tablespoonfuls three times a day. He has treated eighty-seven patients. Some of the patients have remained well as long as three years.

The beneficial effects of crude coal tar in infantile eczema may possibly be explained by its action on the unsaturated fatty acids. Hansen [8] found that, after using crude coal-tar ointment for a few days in these cases, there was an increase in the iodin number of the blood serum parallel to clinical improvement. On stopping treatment the iodin number would drop and an exacerbation would take place. He felt that the explanation for this was that there was an absorption of the unsaturated fatty acids from the ointment.

While these observations on infantile eczema are only preliminary in nature, and must be substantiated by further investigation, they seem to be of the utmost significance.

V

PROTEINS IN RELATION TO THE SKIN

Philip K. Allen, M.D. (Suite 314, Medico-Dental Building, San Diego).—Proteins are indispensable to the life of all animals. They form the bulk and a necessary part of every cell in the body, and their presence is absolutely essential for life. An animal may well exist for a long period on a fat-free or carbohydrate-free diet, but if denied proteins it would promptly die. Plants are capable of synthesizing their own proteins from nitrogen in the soil and air, but animals rely upon the ingestion of preformed proteins of plants or other animals.

Proteins may vary widely in the percentages of their various elements, but are alike in their fundamental composition. All proteins contain nitrogen, carbon, hydrogen, and oxygen. Some also contain sulphur, phosphorous, iodin, and various mineral salts. The protein molecule is a huge and complex one. Most proteins have a molecular weight of approximately 15,000, although many are several times this large. Their relatively enormous size may be appreciated by comparison with the molecular weights of familiar compounds—sodium chlorid 58, hydrochloric acid 36.

[8] Hansen, A. E.: Possible Mechanics of Crude Coal-Tar Therapy in Infantile Eczema, Proc. Soc. Exp. Biol. and Med., 31:61 (Oct.), 1933.

The huge protein molecule, when treated with concentrated acids, alkalies, or acted upon by certain enzymes, will ultimately break up into relatively simple substances known as amino-acids. About twenty of these acids have been isolated. It is of special interest that all proteins, whatever their origin, yield on decomposition essentially the same amino-acids. Some proteins may lack one, two or three of these substances; but, in general, all proteins are built of the same amino-acids into which they break up on digestion. These amino-acids are present in varying proportions in different proteins and are also probably bound together in different ways. Protein digestion begins in the stomach where the gastric enzymes, principally pepsin, partially break up the molecule. This digestive process is continued in the duodenum and small intestine by trypsin and erypsin. The large protein molecule is thus broken up into successively smaller components—proteoses, peptones, peptids and, finally, its integral building stones, the amino-acids. Theoretically, proteins are completely split up in the digestive tract and are absorbed as amino-acids into the circulation. They are then used for growth, tissue repair, and the formation of hormones and enzymes.

In the large intestine the nitrogenous residue is subjected to the putrefactive action of numerous bacteria which are normal inhabitants of the lower intestinal tract. By their action the amino-acids are further split up to form amins, commonly known as ptomains. Although many of these products are harmless or possibly of value to the system, some are extremely toxic.

There are several ways in which the fate of ingested proteins is of importance to the dermatologist.

The first is simply a matter of quantity. Unlike most tissues of the body, the epidermis is in a continual state of growth. Throughout life the older cells are constantly being cast off and replaced by younger cells. Since excess of protein is not stored in the body as are fats and carbohydrates, but promptly used or excreted, a continuous supply of protein material is necessary for epidermal growth. It is difficult to accurately determine the amount of nitrogen demanded by epidermal and mucous membrane growth, but in the average adult this is probably in the neighborhood of one gram of nitrogen or seven grams of protein per day. From a practical standpoint, however, a positive or negative nitrogen balance seems to play a small part in skin pathology. The basal-cells of the epidermis are endowed with the ability to extract their necessary nitrogen from the blood stream at the expense of other tissues, so that atrophy or hypertrophy of the epidermis is but little affected by the amount of protein ingested. On the other hand, it is impossible to state that any cutaneous disease is completely disassociated with diet. The skin, as any other tissue of the body, is dependent upon the general health and nutrition for its well-being.

Toxic ptomains absorbed after putrefaction in the large intestine may be the cause of various dermatoses. Such eruptions as toxic erythema, erythema multiforme and related erythemas, and urticaria, have been shown to be due in some cases to absorption of poisonous ptomains. Among the more toxic of the ptomains should be mentioned histamin, tyramin, putrescin and cadaverin, the latter two extremely toxic in even minute quantities. Foods most commonly credited with the formation of toxic ptomains by bacterial putrefaction include sea foods of all kinds, pork, mushrooms, and strawberries. This type of toxemia, or auto-intoxication, is not to be confused with allergy. Its production does not depend upon a specific hypersensitiveness, but on the toxic properties of the ptomains *per se*.

From a practical standpoint, the widest application of the biochemistry of proteins to dermatology is probably found in the field of allergy. For years it has been known that a specific idiosyncrasy to certain proteins is a frequent, though not constant, factor in various types of skin pathology. Many cases of urticaria, angioneurotic edema, prurigo, eczema, and neurodermatitis, have been shown to be due to such specific sensitization. Rational claims have been made for an allergic background as a cause of many other eruptions, among which are erythema multiforme, dermatitis herpetiformis, aphthous stomatitis, and herpes simplex.

Instances are on record where the ingestion of only a minute amount of a certain protein would precipitate a cutaneous eruption. Since other proteins, harmless to the individual, produce the same amino-acids, it is evident that the amino-acids themselves do not play a part in such an allergic reaction. It has been shown that the absorption of incompletely digested proteins actually takes place in some allergic reactions to food. Although an irritation or inflammation of the intestinal mucosa may greatly facilitate the absorption of larger protein derivatives, this abnormal physiologic process may take place in the absence of any intestinal pathology. Thus, two conditions are apparently necessary to the production of allergic reactions to ingested foods: (1) A hypersensitiveness to a specific protein. (2) Absorption of the incompletely digested protein through the intestinal mucosa.

Opinions differ as to the foods most likely to produce allergic reactions in the skin. Among the more common offenders may be mentioned eggs, cheese, sea foods, uncooked fruits, berries, pork, tomatoes, nuts, and chocolate. However, it must be borne in mind that any protein may elicit an allergic response, and that the case in hand is one for individual study.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section (Adv. pages 2, 4 and 6).

CALIFORNIA MEDICAL ASSOCIATION

ROBERT A. PEERS..President
EDWARD M. PALLETTE........................President-Elect
FREDERICK C. WARNSHUIS..
Secretary-Treasurer and Associate Editor for California

STATE AND COUNTY SOCIETY ACTIVITIES

"I GIVE AND BEQUEATH"

This Association is engaged in maintaining contacts and supporting movements initiated by lay and governmental agencies. In all of these functions a sustained effort is made to foster the public's and the profession's best interests. Supplementing these representations the Association strives to refute and discredit the claims and activities of those groups and individuals who seek to prey upon the public for selfish purposes and for personal profit.

This Association also concerns itself with the scientific and professional interests of its members. The Council, officers, standing and special committees, and constituent units are persistently and consistently engaged day in and day out in an earnest endeavor to attain in fullest degree all of the purposes and objects of organization. The only goal is public and professional betterment that eventuates in a more satisfactory condition of social and economic welfare in California.

To carry on these movements requires funds in excess of those that accrue from yearly dues and advertising income. Our progress is restrained by the limitation of funds. Our progress would be more rapid if we possessed greater resources.

Our Association's existence dates back to 1856. In the eighty years that have gone by *only one bequest* has been made to the Association. That bequest was made by the late Dr. Morris Herzstein, in the sum of $20,000. The interest of this trust fund accrues to this Association.

Surely, there are some among our membership who are financially able to emulate the example of Doctor Herzstein. What better bequest could be made and what other organization is more worthy of being the recipient of similar bequests? To you who have been fortunate in acquiring funds and financial resources, this appeal is made: Will you make a provision in your will to give and bequeath a definite sum to this Association for the purpose of providing additional resources for organization work? The principal can remain in perpetuity as an enduring memorial to yourself or some member of your family, while the trust earnings will enable the Association to expand its functions and efforts.

There are undoubtedly some who are now able to create such a trust or endowment fund. The plea is made that you give serious consideration to this request and suggestion.

"I give and bequeath"—please consider the nature and extent of a bequest that you can execute in behalf of and to the California Medical Association.*

SECRETARIES' ANNUAL CONFERENCE

On page 210 of this issue, members and county secretaries will find a digest of papers and discussions presented at the County Secretaries' Conference January 18. Members particularly are urged to devote sufficient time to read this informative report. In addition, also, be sure to read the minutes of the Council published in the February issue. These two reports will enable you to gain a greater insight as to what your Association is doing in your and the public's interests.

SOCIAL INSURANCES

In an address delivered before the annual meeting of mechanical engineers, R. Robert Jones, general manager of the Association of Casualty and Surety Executives, presents the following conclusions:

"I have dealt principally with the problems of Workmen's Compensation. I also have tried to make it clear that the newly impending social insurances present similar problems. The chief issue before us, however, is not how to correct the overlapping and inconsistencies of the present schemes, no matter how important such amendments may seem to be. The chief issue really is, how can industry bear the tremendous financial burdens imposed by the vast system of accident compensation, occupational disease benefits, old-age pensions, unemployment insurance, and various other social insurances. Even with workable laws and perfect administration, this issue would present grave dangers to our economic structure. But when accentuated by a hodgepodge of enactments devised by academic theorists in coöperation with political spoilsmen, and with their administration in the hands of bureaucrats and petty demagogues, this issue becomes the most serious one confronting America today. There is no easier approach to the economic reorganization of society and to the regimentation of business under government corporals, lieutenants, captains, colonels, and generals than bankrupting industry by the subtle process of making it responsible on a scale beyond its capacity for the health, welfare, and even improvidence of those in its service through accident and disease compensation, pensions, subsidies and other gratuities.

"Even if the present benefits prescribed by the multitude of social insurances do not particularly alarm, it must be remembered that the tendency in all such legislation is upward—toward increased payments by industry. The increase in workmen's compensation costs over a twenty-year period have been tremendous, and with occupational disease hazards recently added in many states, it has become terrifying. Undoubtedly the same tendency will be manifested in respect to the newer types of social insurance. What the results will be no man can tell, but the problem which American business must solve is not only gigantic as a whole, but complex in every detail.

"If the problem is to be solved at all, it cannot be solved by political methods, by passing resolutions or by speech-making. The whole subject is a highly technical one. It requires a careful study of all the factors involved; for illustration, that these social insurances in the aggregate may be highly detrimental to labor apparently has not been considered by labor leaders who are promoting these measures. The same is true of the politicians who have taken their cue from the labor organizations. The average worker knows nothing of the subject and consequently his opinion is based on what he has been told is his immediate self-interest. He does not comprehend the ultimate effect of such legislation upon him or his fellows, and, therefore, is easily misled by agitators who claim they are trying to help him. He does not realize that subsidies come from the same source as do wages, and that if the wage-well is dry, the subsidy pump will not work. This, however, is only one sector of the major problem, but it is one which needs to be examined by all concerned in the light of today's experience.

"If we are to continue to have legislation of the type I have been discussing, the problems it presents never can be satisfactorily solved unless they are entirely divorced from politics and vote-getting considerations. Subject to the perverting influences of politics, legislation of this type is a serious menace to the public welfare."

* * *

HOTEL ACCOMMODATIONS

By January 18, following several published notices to write for reservations, all the accommodations in Hotel Del Coronado were reserved by members. While this large advance reservation foretells a large attendance at our annual meeting, it does not mean that those who failed to secure early reservations must forego attendance.

---

*See also editorial comment on page 154.

San Diego city affords ample, additional accommodations in the following first-class hotels:

Hotel San Diego—400 rooms. Rates, $2 to $6.
El Cortez Hotel—250 rooms. Rates, $3.50 to $8.
Pickwick Hotel—250 rooms. Rates, $2.50 to $8.
Stanford Hotel—150 rooms. Rates, $1.50 to $6.
U. S. Grant Hotel—500 rooms. Rates, $3.50 to $9.

Members are urged to make reservations, as the 1936 Exposition will cause a demand for rooms. There will be a ten-minute ferry service to Coronado, and meeting places can be reached in twenty-five minutes.

There are three reasons why our members should plan to spend the week of May 24 in San Diego:

First: Our sixty-fifth annual meeting, with its exceptional scientific and social program.

Second: The 1936 San Diego Exposition, featuring a Hall of Medical Science. and

Third: Decoration Day, holiday.

Make your plans now.

CONFERENCE OF COUNTY SECRETARIES

As previously imparted, a conference of county secretaries with the Council and the officers of the Association was held in San Francisco on January 18. The theme of the conference was "policies and problems of our Association."

County secretaries are the very important "key men" of our organization. In order to effectively discharge their responsibilities, it is vital that these officers be intimately familiar with all problems in order to obtain unity of action. The conference has been appraised as a forward movement in furthering Association objectives.

It is impossible to publish in full detail all of the addresses and discussions. Abstracts for the information of the individual member appear on page 210.

COUNTY VISITS

During February State Association officers made visits and addressed the following county meetings:

Santa Cruz, February 11 at Santa Cruz; Monterey, February 12 at Salinas; Imperial, February 17 at Brawley; Orange, February 18 at Santa Ana; Santa Barbara and Ventura, February 19 at Santa Maria; Hollywood February 20.

Gratifying attendance was recorded at all of these engagements.

INTRODUCTION OF RESOLUTIONS AT ANNUAL MEETING

By Council action two years ago county societies and delegates were requested to submit to the State Secretary, at least sixty days before the annual meeting, any resolutions that they contemplate introducing in the House of Delegates. The purpose of this request is to make it possible to publish such proposed resolutions in the Pre-Convention Bulletin for the advance information of all delegates.

In conformity with this precedent, delegates and county societies are respectfully requested to observe this procedure. It is quite desirable that proposed action be imparted to all delegates in order that they may consult with the county members whom they represent.

VAST SILENCE

An editor or radio broadcaster addresses his audience in the vast silence of open spaces, and then he waits and wonders. In the case of the editor, when the last page proof has been checked and the publication mailed—well, he waits for and welcomes constructive comment and relishes an occasional commendation. Does he receive them? Kicks, yes; constructive comment, now and then; commendation, rarely; vast silences, as a rule. That is why editors live hours in minutes.

This is not a plea for bouquets. The Editor and State Secretary are merely soliciting members' comments so as to know their problems and thoughts in order to be more helpful and render greater service. In order to reduce the vast area of silence and to evoke response, will you send in your expression on:

"What should be done to correct the practice of some doctors who bid for business from employers and insurance corporations by quoting cut or reduced fees?"

YOUR COUNTY SOCIETY

Numerical affiliations do not make a county society a going organization. Mere membership and payment of annual dues give evidence only that you can be of potential service—a possibility, unless awakened and induced to engage in active society work, classifies the member as a minor, nonproductive asset.

A going county society and the benefits derived from membership depend directly upon the individual member. A single soldier, squad, or even a platoon, never captured a trench. Objectives were reached by the fighting spirit and advance of companies, regiments, and divisions—all participating, in close liaison, in their forward movement. So, too, must it be with our county, districts, and state medical organization. As an individual, the member must subscribe his efforts for unit performance and action.

This observation and conclusion has been stated upon many occasions by those who carry the obligation of official duties. In spite of many repetitions it is still very common for a member to state that he does not attend his county meetings because he belongs to a dormant society and gets very little benefit from it. It is, therefore, necessary to persistently keep reminding members that "they *get* in just proportion to what they *give.*" In that respect our attitude continues to be intransigent.

A much-twanged string is the theme of medical organization; and yet, withal, a string capable of yielding indefinitely new or varied notes. Organization has become in medicine, as in almost every other department of human activity, the watchword of endeavor and achievement. Our medical societies are the great postgraduate schools of the profession, where knowledge is increased and the individual character developed. The enthusiasm engendered, the energy awakened by the attrition of mind against mind in the medical society meeting cannot be otherwise than of incalculable value. No medical society can rest on its oars.

The great underlying principle of all medical organization is to reach the individual doctor, to cause him to realize he has other responsibilities than those pertaining to his immediate clientele, to broaden his mental vision, to awaken him to the fact that association with his fellows will enable him to mold public opinion and wield an influence in the affairs of men. To possess vitality the doctor must be organically united to the general body of his profession. Let the doctor's interest in and devotion to his county society never flag or wane. Let every member keep in harness; work and be ready to work.

When you, lone member, accept and conform to these principles, your society benefits, through membership, will mount to the highest pinnacle. It is yours to choose the sum total of benefit that you derive.

MONTH'S HAPPENINGS

- February was a busy month, with seven meetings with nine county societies.
- The Committee on Public Relations held two meetings.
- The Executive Committee met on the last Saturday of the month. The Council will meet in San Francisco on April 11.
- The Cancer Commission has arranged a splendid program for the Sunday conference preceding our annual meeting.
